SQL Injection has been around for over 10 years, and yet it is still to this day not truly understood by many security professionals and developers. With the recent mass attacks against sites across the world, and well publicised data breaches with SQL Injection as a component, it has again come to the fore of vulnerabilities under the spotlight, however many consider it to only be a data access issue, or parameterized queries to be a panacea. This talk explores the deeper, darker areas of SQL Injection, hybrid attacks, SQL Injection worms, and exploiting database functionality. Explore what kinds of things we can expect in future.
