Correction to: Applied Microbiology and Biotechnology <https://doi.org/10.1007/s00253-019-09830-y>

The original publication of this paper contains some errors.

- 1) The bacterial name “*Lactococcus alimentarius*” in Fig. 2 is incorrectly presented. The correct name is “*Lactobacillus alimentarius*.”
- 2) In the paragraph on “Genetic organization and regulation of glycerol metabolism genes in lactic acid bacteria,” the G3P-oxidizing enzyme and its corresponding gene in *Lactococcus lactis* subsp. *cremoris* and *Lactobacillus alimentarius* are incorrectly substituted. The corrected sentences are as follows:
 - 3) In Table 1, “*glpD*” of *Lactococcus lactis* subsp. *cremoris* in the G3P oxidation column is incorrect; the correct term is “*glpA*.” The *glpA* encodes anaerobic G3P dehydrogenase subunit A.
 - 4) In Fig. 3a, the “*glpKDF* operon” is incorrect; the correct term is “*glpKAF* operon.”
 - 5) In Table 2, “*glpKDF*” of *Lactococcus lactis* subsp. *cremoris* in the operon column is incorrect; the correct term is “*glpKAF*.”
 - 6) In Table 2, the strain name “SF11” of *Lactococcus lactis* subsp. *cremoris* is incorrectly presented. The correct strain name is “SK11.”

However, the phylogenetic tree analysis of the LAB listed in Table 1 indicated that *Lactococcus lactis* subsp. *cremoris* and *Lactobacillus alimentarius* contain GlpA and GlpD, respectively (Fig. 2). LAB’s *glpO* or *L. lactis* subsp. *cremoris*’s *glpA* constitute operons along with the *glpK* and *glpF* (encoding glycerol facilitator protein GlpF), except for *L. alimentarius*’s *glpD* (Fig. 3).
