

## Editorial Note

The fifth biennial meeting of the International Association for Relativistic Dynamics (IARD) took place in June 2006 at the Storrs campus of the University of Connecticut. The proceedings of that meeting, contained in the present issue and the next of *Foundations of Physics*, are the latest in a series of IARD proceedings we have published since 2000. The intent of these proceedings has been to provide summaries on a periodic basis of the progress in research on the fundamental questions of relativistic classical and quantum mechanics, progress stimulated in large measure by the efforts of participants in the IARD conferences themselves.
