**Fig. 21** Linear correlation of **a** minimum and **b** maximum most perceptible earthquake magnitude for horizontal ground acceleration and horizontal ground velocity for a nominal earthquake of 15-km focal depth. The *solid line* is the best-fit through maximum credible magnitude data points ( $M_3$ ) derived from the summation of cumulative seismic moment release in the considered area; *dashed line* is the best-fit through most perceptible earthquake magnitude ( $M_{P(\max)}$ ) data points
