CASE: A 59-year-old Hispanic male presented to the emergency department (ED) with the sudden onset of right-sided weakness, altered mental status and difficulty walking. The symptoms were witnessed by family members and began one hour before evaluation in ED. He also reported shortness of breath and denied nausea, vomiting, dizziness, chest pain. His past medical history was significant for cocaine and alcohol abuse, hypertension and cerebrovascular event with a right hemiplegia. His vital signs showed elevated blood pressure. At the physical examination the patient was alert, awake, yet confused. Neurological examination showed minimal right side weakness in upper and lower extremities and decreased sensation on V3 distribution. His initial laboratory evaluation showed PT 10.9 sec, APTT 27.1 sec, INR 0.95, BUN 32, Creatinine 1.6, WBC count of 11.1, hemoglobin of 11.9 and urine drug screen positive for cocaine and cannabinoids. Emergent CT of the brain without contrast showed no acute intracranial hemorrhage, tentorial infarction, mass effect or midline shift. Compared with previous studies there was focal low attenuation within the left corona radiata. The patient received an NIH score of 1 and it was determined that he was not a candidate for tpA. A further neurological evaluation was performed and the symptoms resolved. MRI/MRA of the brain showed T2 hyperintensity in the mammillary bodies, thalami and periaqueductal grey matter with patent intracranial arteries. The findings suggested Wernicke's encephalopathy and he was started on thiamine 500mg for 2 days and 200mg for the next 10, Folic acid at 1mg daily and Vit B12 1000mcg sublingual for the next 30 days. Upon follow up evaluation the patient exhibited no neurologic symptoms and was noted to be awake and oriented to person, place and time.

IMPACT: This patient presented with typical signs and symptoms of a cerebrovascular event, he did not present to the ED with the classic triad of oculomotor dysfunction, ataxia and encephalopathy. Only through a careful revision of his past medical history and through further studies was the diagnosis of WE supported. This case demonstrates that patients do not always read the book, and uncommon presentations require detailed evaluation for the correct diagnosis and treatment.

DISCUSSION: Wernicke's encephalopathy (WE), an acute neuropsychiatric condition, is caused by thiamine deficiency and has been associated with background of alcoholism especially in many countries where the alcohol consumption has escalated over the past decade. Three common Wernicke's encephalopathy manifestations include ocular abnormalities, ataxia or unsteadiness, and confusion. Despite these constellation of symptoms, WE may also exist behind what at first appears to be a typical CVA.

WHAT IN THE LYMPH IS GOING ON?

Brittany D. Jones-Linares[1, 3]; Sherwin Hsu[2, 1]; Phillis Wu[2, 1]. [1]David Geffen School of Medicine, Palmdale, CA; [2]Olive View - UCLA Medical Center, Sylmar, CA; [3]Charles R. Drew University of Medicine and Science, Los Angeles, CA. (Control ID #2701370)

LEARNING OBJECTIVE #1: Evaluate a patient with diffuse lymphadenopathy in the acute care setting.

LEARNING OBJECTIVE #2: Recognize the differential diagnosis of a patient presenting with generalized lymphadenopathy.

CASE: A 54 year-old previously incarcerated homeless man presented with five months of worsening scrotal edema, lower extremity swelling, and tender diffuse lymphadenopathy. He also noted a fifty-pound weight loss, night sweats and exertional dyspnea. Initial vitals were notable for tachycardia and tachypnea. He had prominent submandibular (6x7cm), supraclavicular, axillary (10x10cm) and inguinal (8x10cm) lymph nodes bilaterally. All nodes were firm, immobile and tender to palpation. The lungs were clear, there was no JVP elevation, and no organomegaly noted in the abdomen. There was significant scrotal swelling and bilateral pitting edema of the lower extremities. Skin examination revealed no jaundice or rashes. Labs revealed leukocytosis with neutrophilic predominance, normocytic anemia, low albumin, high ferritin, elevated lactate, LDH of 1039 and uric acid was 6. A comprehensive infectious workup, including blood/urine cultures, fungal studies, HIV, sputum TB cultures, and viral hepatitis,was negative. CT scans of the neck, chest, abdomen and pelvis revealed diffuse multi-compartmental lymphadenopathy, pulmonary nodules and a lateral soft tissue mass at C1 causing pathologic fracture. MRI Brain showed dural enhancement. Lymph node biopsy revealed pathology consistent with ALK negative anaplastic large cell lymphoma. He was subsequently started on CHOEP chemotherapy.

IMPACT: Lymphoma should be considered in patients with peripheral or generalized lymphadenopathy. Non-Hodgkin Lymphoma is a common cause of cancer in the United States. Aggressive lymphomas commonly present with a rapidly growing mass, B symptoms, and/or elevated levels of serum lactate dehydrogenase and uric acid from tumor lysis. Due to associated morbidity and mortality it is a diagnosis that should not be missed and work-up needs to be expedited in patient with significant symptoms or evidence of high cell turnover.

DISCUSSION: Lymphadenopathy is a common complaint encountered by internists. When diffuse, it typically indicates a systemic process. The differential includes autoimmune, malignant, and infectious etiologies. A complete history is the first step in evaluating diffuse lymphadenopathy. A thorough

review of systems (fevers, night sweats, weight loss, arthralgia, rash, etc.), including duration of lymphadenopathy, along with exposure, social, and family histories is important. A thorough physical exam should be performed with focus on the location, size, consistency, and tenderness of the lymph nodes. Workup should be initiated with basic blood work and then targeted further depending on the differential. Complete evaluation of lymph nodes should be performed with CT scans with IV contrast for full evaluation. If lymphoma is high on the differental, than an excisional biopsy is the gold standard.

WHAT LIES BENEATH: HODGKIN'S LYMPHOMA MIMICKING RECURRENT CRYPTOGENIC ORGANIZING PNEUMONIA Asma Khatoon; Salman Raheem; Kyrstin Eklund; Amit Mann. Methodist Dallas Medical Center, Dallas, TX. (Control ID #2690723)

LEARNING OBJECTIVE #1: Our patient presented with an assortment of previous illnesses which caused a diagnostic conundrum. Good history taking and organized approach to her case ultimately helped in not only diagnosing Hodgkin's lymphoma but also timely instatement of treatment for this highly curable condition.

CASE: A 25-year-old Hispanic female presented to our hospital with a 2-day history of abdominal pain which began abruptly and was associated with fevers, chills as well as intermittent nonproductive cough which had been present since her last episode of pneumonia about 6 months ago. She was admitted to the ICU for management of septic shock and briefly required pressor support along with broad spectrum antibiotics. Past medical history was remarkable for Brill-Zinsser disease and cryptogenic organizing pneumonia (COP), both diagnosed 2 years ago. She had traveled to Mexico 2 months ago, and was treated for recurrent Typhus at that time. Hypotension improved however, she continued to have fever daily despite adequate treatment of her presumed pneumonia. A wide array of tests ensued to rule out infectious and autoimmune causes of her fever. Patient tested negative for HIV, TB, syphilis, Legionella, Chlamydia, Streptococcal pneumonia, Typhus and various other serologies. Tests of autoimmunity remained negative as well. Imaging revealed bulky lymphadenopathy in paratracheal, subcarinal, paraaortic lymph nodes and around bifurcation of aorta along with left pelvic and obturator lymph nodes. CT chest was concerning for recurrence of COP. Review of lung biopsy report from an outside hospital was consistent with COP. Patient eventually underwent an excisional lymph node biopsy. Histopathology and immunohistochemical stains identified Reed-Sternberg cells and thus a diagnosis of Hodgkin's lymphoma was made. Oncology service was consulted and patient was initiated on appropriate chemotherapy with quick resolution of fevers.

IMPACT: This case illustrates the importance of avoiding anchoring heuristic. Anchoring Heuristic, also known as focalism, refers to the human tendency to accept and rely on, the first piece of information received before making a decision.

DISCUSSION: Cryptogenic organizing pneumonia (COP) represents a kaleidoscope of morphologies and concepts, often confused with a series of conditions, among which the most feared are Hodgkin's lymphoma and bronchoalveolar carcinoma. We present the case of a young female with previously known diagnoses of COP and Brill-Zinsser disease in the setting of new onset lymphadenopathy. The non-favorable evolution of her symptoms and the high index of suspicion of the conditions that may mimic the COP histopathological pattern, were the basis of our persistence in getting the *real diagnosis*.

WHAT THE EYES DON'T SEE, THE HEART DOES GRIEVE OVER Michael Sciaudone. Tulane University, New Orleans, LA. (Control ID #2705909)

LEARNING OBJECTIVE #1: Discuss the causes of endophthalmitis

LEARNING OBJECTIVE #2: Recognize the severity of systemic infections due to Candida

CASE: A 71-year-old Peruvian woman presented with blurry vision and bilateral eye pain. Within the preceding months, she had multiple abdominal surgeries, including an incarcerated inguinal hernia repair with ileostomy and acute cholecystitis requiring cholecystostomy tube. During her hospitalizations, she developed bacteremia and fungemia on several occasions, with multiple Gram negative bacteria and Candida albicans. Upon this presentation, she was febrile and tachycardic. She had bilateral conjunctival injection, hypopyon, and severely decreased visual acuity. She also had a III/VI harsh holosystolic murmur at the apex. Thorough ophthalmic exam revealed evidence of bilateral endophthalmitis. Antifungal agents and antibiotics were initiated. Transesophageal echocardiogram revealed severe mitral regurgitation and a 16 × 15 mm mitral valve vegetation and a perforated aneurysmal posterior mitral valve leaflet. She underwent bilateral vitrectomy. Eye lesions appeared consistent with fungal endophthalmitis. Blood and vitreous humor cultures were obtained, but remained negative (drawn after antimicrobial therapy). Given the size of the vegetation and intraoperative findings, she was treated with flucytosine and ambisome for a suspected Candidal infection. She continued to spike fevers and developed heart failure, but refused valve replacement surgery as she wished to return to her home country.

IMPACT: In a patient with bilateral endophthalmitis, an internist should consider and evaluate for a systemic source of infection such as endocarditis.

DISCUSSION: correctly diagnose endophthalmitis, a high degree of suspicion is needed, as referral to ophthalmology is critical. Endophthalmitis may be due to exogenous or endogenous causes. Frequently, exogenous endophthalmitis is associated with trauma or surgery. Endogenous endophthalmitis implies a hematogenous source. Blood cultures and intraocular cultures should be obtained upon presentation along with an echocardiogram, as endocarditis may be the source of infection. While Candida is the most common organism to cause endogenous endophthalmitis, other causes can include Strep pneumo or Staph aureus. In our case, we suspected hematogenous seeding from endocarditis or an intra-abdominal infection, given the patient history of multiple complicated abdominal surgeries and recurrent bacteremia and candidemia. Candida is a rare but morbid cause of infective endocarditis. Arterial embolization and metastatic infections such as endophthalmitis are more frequent in candidal endocarditis. Valve replacement should be strongly considered as a mortality benefit for antifungals and surgery compared to antifungals alone has been demonstrated. In cases in which valve replacement is not feasible, lifelong suppressive antifungal therapy should be considered.

WHEN A BROKEN HEART LEADS TO A PAINFUL STOMACH Shadi Dowlatshahi[1, 2]; Patricia Lorenzo[2]; Wei-I Vickie Wu[2]. [1]Oregon Health and Science University, Portland, OR; [2]Keck School of Medicine University of Southern California, Los Angeles, CA. (Control ID #2705215)

LEARNING OBJECTIVE #1: Recognize gastroparesis as a potential complication of radiofrequency catheter ablation in the treatment of atrial fibrillation

CASE: This is a 67-year-old female with history of hypertension, and atrial fibrillation (AF) status post radiofrequency (RF) catheter ablation one week prior, who presented with new onset of abdominal pain with associated nausea and vomiting. Post procedure the patient was doing well, however over the course of the week the patient noted diffuse abdominal pain that was worse after eating. She noted symptoms of abdominal bloating, nausea and vomiting after only a few bites. Patient also reported constipation. On exam, vitals were normal. Abdominal exam revealed the presence of bowel sounds, and a distended abdomen with diffuse tenderness to palpation. No guarding or rebound was present. CT abdomen was performed showing gastric distention but no evidence of obstruction. A nuclear medicine gastric emptying study was ordered and showed 45% retained food at 3 hours, confirming the diagnosis of gastroparesis. Nasogastric tube was placed with initiation of IV metoclopramide. Patient reported improvement of her symptoms within two days and her diet was advanced to a low fat and fiber diet. After discussion with cardiology and gastroenterology, the etiology of the patient's gastroparesis was determined to be related to recent RF catheter ablation.

IMPACT: Gastroparesis is an under-recognized complication of radiofrequency catheter ablation.

DISCUSSION: Refractory AF may be treated with RF catheter ablation. Although complications are infrequent, most physicians are aware of cardiac complications that may result, such as embolic events. However, few clinicians are cognizant of the extracardiac complications that may occur with catheter ablation. Gastroparesis is characterized by the delayed emptying of gastric contents in the absence of a mechanical obstruction. While typically recognized as a complication of diabetes, gastroparesis may occur in the acute setting after RF catheter ablation secondary to paraesophageal vagal nerve plexus injury. Patients will typically present within 72 hours post-procedure. As few cases have been reported, it is difficult to define the incidence of this complication. In a study by Kuwahara et al. (2013) only 11 of the 3,538 patients monitored post ablation developed gastroparesis. Patients with recent RF catheter ablation who present with symptoms suggestive of gastroparesis should raise suspicion. A gastric emptying study should be ordered for confirmation. Treatment is similar to other etiologies of gastroparesis, including a low fat and fiber diet, and use of pro-kinetic agents. Symptoms typically resolve within 6 months, without further need for treatment. As catheter ablation continues to be a frequent treatment modality for refractory AF, physicians should be aware of this rare complication to aid in early detection and treatment.

WHEN A SIMPLE CYST CAN THREATEN YOUR LIFE Christian Ibanez; Shayan Siddiqui; Dianne Srinilta; Omar Bazzaz; Roger D. Smalligan. Texas Tech Univ Health Sc Center - Amarillo, Amarillo, TX. (Control ID #2699852)

LEARNING OBJECTIVE #1: Recognize an uncommon etiology of seizures in a young person

LEARNING OBJECTIVE #2: Understand the risks, including death in a patient with a colloid cyst

CASE: A 37yo male with unknown past medical history was found unresponsive in his vehicle and brought to the emergency room for evaluation. On exam, vitals were HR 72, BP 111/66, RR 13, T 37C, SpO2 100%. In the ER, the patient had several episodes of generalized tonic-clonic seizures and was intubated and sedated for airway protection. Lab work was normal except for glucose of 141, bicarbonate 18.0, WBC 16.6 with 88.1% neutrophils. Urine toxicology was negative. A CT scan of the brain showed a hyperdense mass involving the junction of the lateral and third ventricle suggestive of a colloid cyst with local mass effect causing obstructive hydrocephalus. Lumbar puncture was negative except for an elevated opening pressure. MRI confirmed the suspicion of a colloid cyst. A chest x-ray was suggestive of aspiration pneumonitis. The patient was treated with levetiracetam, dexamethasone, and piperacillin/tazobactam. With his seizures controlled, the patient was extubated. Despite long, sincere conversations with the primary team and the neurosurgeon regarding the need to resect the cyst, the patient decided to leave against medical advice.

IMPACT: This case reminds physicians to consider alternative etiologies when a patient presents with acute seizures. Urgent neurosurgery may be needed to prevent morbidity and mortality in a patient with a colloid cyst that is causing obstructive hydrocephalus.

DISCUSSION: New onset seizures in a young adult is a common presentation on the hospital service. Common etiologies include nonadherence to antiepileptic medications, alcohol/drug intoxication or withdrawal, metabolic or electrolyte disturbances and head trauma. This case highlights an unusual etiology–obstructive hydrocephalus secondary to a colloid cyst. Colloid cysts are a developmental malformation consisting of a fibrous outer layer and a mucin-producing inner epithelium. The most common location for colloid cysts is the anterior roof of the third ventricle, near the Foramen of Monroe, exactly as seen in our patient. They are usually asymptomatic; however, when symptoms do occur they include intermittent headaches and those related to obstructive hydrocephalus and the associated increased intracranial pressure such as nausea, vomiting and seizures. On exam there is papilledema. Those with symptoms are more commonly young adults. Rarely, drop attacks and even sudden death can occur if there is herniation. Our patient denied headaches and drop attacks prior to his seizures and presentation to the emergency room. Management of symptomatic colloid cysts requires surgical resection with ventriculoperitoneal shunt placement or aspiration.

WHEN ASCITES ISN'T CLEAR Nicole H. Dillow[2]; David Kiviat[1]; Susanne Anderson[1]; Margaret C. Lo[1]. [1]University of Florida College of Medicine, Gainesville, FL; [2]University of Florida Health, Gainesville, FL. (Control ID #2709426)

LEARNING OBJECTIVE #1: Identify the risk factors of chylous ascites

LEARNING OBJECTIVE #2: Diagnose and manage chylous ascites

CASE: A 66 year-old cachectic male presented with acute epigastric pain and in severe sepsis. History included alcoholism, duodenal ulcer s/p ablation, and gallbladder perforation s/p recent cholecystectomy. Initial GI exam revealed no ascites or rebound tenderness. Labs noted leukocytosis with bandemia, elevated LFTs, and mild lipase elevation. CT abdomen revealed pancreatic inflammation with scant fluid in peripancreatic area. MCRP confirmed an acute interstitial edematous pancreatitis. Blood cultures later grew ESBL E. Coli; meropenem was started. Hospitalization was complicated by a long MICU stay for septic shock and acute hypoxic respiratory failure. Repeat CT abdomen showed increased fluid in the peritoneal cavity. Paracentesis revealed spontaneous bacterial peritonitis (SBP). Ceftriaxone was added and percutaneous drain placed with high output. Fluid culture and cytology were negative. Soon thereafter, ascitic fluid changed from purulent to milky white. Ascitic

triglyceride level was high (289mg/dL), confirming diagnosis of chylous ascites. Surgery declined TIPS procedure. Fluid output slowly stabilized with low fat diet and maximum octreotide dose. Given prolonged hospital course, patient was transferred to an acute care hospital for further care.

IMPACT: This case demonstrates that ascites is not always a result of portal hypertension and can result from lymphatic processes. Any source of lymphatic leakage or obstruction can lead to chylous ascites. Abdominal surgery and trauma are well-cited causes. Our case adds to the limited literature of acute pancreatitis and laparoscopic cholecystectomy as additional rare risk factors for chylous ascites.

DISCUSSION: Chylous ascites is often manifested as painless abdominal distension. Index of suspicion should be high for those with risk factors. Most common ones include congenital lymphatic abnormalities and malignancy, notably lymphoma. Other risk factors include right-sided heart failure, constrictive pericarditis, abdominal radiation, and cirrhosis. In developing countries, infectious causes (i.e. tuberculosis, filariasis) are well-reported. Paracentesis is key for diagnosis; the fluid will be milky white from high triglycerides >200mg/dL. Fluid analysis should include cytology to evaluate for malignancy. Chyle leaks can lead to complications from loss of protein, lipids, water, immunoglobulins, vitamins, and electrolytes. Prognosis is poor. Patients often develop severe malnutrition, impaired immunity, and recurrent infections. Treatment is mostly conservative and includes high-protein/low-fat diets, therapeutic paracentesis, and somatostatins. Paracentesis provides symptomatic relief, but can accelerate complications. TPN can be used to reduce chyle production from enteral intake. TIPS and LeVeen shunt are for refractory cases but carry high morbidity. Therapy must target the underlying cause and address nutritional support.

WHEN ENDOCARDITIS BESPOKE CANCER Serin Edwin; Isha Shrestha. MacNeal Hospital, Berwyn, IL. (Control ID #2706579)

LEARNING OBJECTIVE #1: Recognize Non-Bacterial Thrombotic Endocarditis as a rare cause of systemic embolization

LEARNING OBJECTIVE #2: Judiciously screen for associated malignancies upon detection of Non-Bacterial Thrombotic Endocarditis

CASE: An 83-year-old female with a PMH significant for DM, HTN, HLD, left temporoparietal CVA with resulting aphasia, and a recent admission for DVT and PE, presented with lethargy and poor oral intake. In the ED, patient was noted to have altered mental status. Physical examination was remarkable for BP at 94/60, receptive and expressive aphasia, mild right sided weakness, and a tongue deviation to the left. Chest X-ray was unremarkable. EKG showed a normal sinus rhythm, moderate voltage criteria for LVH, and inverted T-waves. Laboratory findings were significant for an elevated troponin at 2.4, WBC count of 14.7, and urinalysis showing 10–15 WBCs. She was started on Lovenox for the treatment of NSTEMI and IV antibiotics for UTI. Over the next 24 hours, the patient became more lethargic and an MRI was performed, which revealed a hemorrhagic left frontal lobe infarction and numerous new bilateral cerebral and cerebellar infarctions, suspicious for embolic infarctions. Lovenox was immediately discontinued due to the hemorrhagic infarction, and the concern for showering emboli prompted a TEE to be performed. TEE showed a moderate sized vegetation attached to the anterior mitral leaflet measuring 8x5mm in size, and a diagnosis of endocarditis was made. Blood cultures were however found to be negative. This raised a suspicion of Non-Bacterial Thrombotic Endocarditis (NBTE). A screening CT abdomen pelvis was done, which confirmed findings consistent with metastatic disease in the liver, pancreas and kidney. Over the hospital course the patient became progressively less responsive. Given her poor prognosis due to the likely advanced malignancy and stroke, the patient was transferred to hospice.

IMPACT: This case demonstrates the importance of a high index of suspicion for NBTE in presentations suggesting systemic embolization. This enables screening and detection of serious underlying associated diseases, including malignancies.

DISCUSSION: Non-bacterial Thrombotic Endocarditis is a rare disease entity, even more rarely identified ante-mortem. This condition is characterized by sterile cardiac vegetations caused by fibrin and trapped platelets on an uninflamed valve leaflet. Presentations usually involve evidences of systemic embolization, ranging from rash, hematuria and digital ischemia, to stroke and chest pain. Echocardiography is used to identify vegetations, with a notable absence of organisms causing endocarditis on microbiology. Management involves anticoagulation with LMWH or UFH indefinitely. Valvular surgery is performed in cases where appropriate. This condition is most commonly associated with malignancy, as was seen in this patient. Other associations include a hypercoagulable state, SLE, RA, and RHD. A workup for these underlying etiologies is recommended in cases of NBTE.

WHEN IS THE DUKE CRITERIA NOT ENOUGH? Faraz Fiazuddin[2]; Farah Ladak[3]; Temple Ratcliffe[1]. [1]UTHSCSA, San Antonio, TX; [2]University of Texas Health Science Center - San Antonio, San Antonio, TX; [3]University of Texas Health Science Center San Antonio, San Antonio, TX. (Control ID #2687868)

LEARNING OBJECTIVE #1: To identify Infective Endocarditis in the absence of Duke's criteria.

CASE: A 54 years-old-woman presented with one week of progressive fatigue, shortness of breath, and productive cough. Physical exam revealed fever of 101.6 F, poor oral dentition, bilateral pulmonary crackles and left lower quadrant abdominal tenderness. Initial laboratory workup was remarkable for elevated procalcitonin which prompted initiation of broad spectrum antibiotics. Chest X-ray was concerning for a multifocal pneumonia and subsequent CT chest showed multifocal airspace opacities concerning for septic emboli. CT abdomen/pelvis showed a probable splenic infarct. There was moderate tricuspid regurgitation with no vegetations or perforations, and preserved ejection fraction on echocardiogram. On second day of admission she became acutely confused without any focal neurological deficits. CT head showed recent left occipital and cerebellar infarcts and subsequent MRI brain revealed posterior and middle cerebral artery infarcts concerning for embolic phenomenon. Infectious workup was only significant for Methicillin-susceptible Staphylococcus aureus (MSSA) positive sputum culture; multiple blood cultures obtained throughout admission were negative for any microbial growth. Despite negative blood cultures, absence of valvular vegetations on echocardiogram; the patient's radiological findings were consistent with septic emboli to brain, lungs and spleen from presumed MSSA Infective Endocarditis.

IMPACT: Infective endocarditis although uncommon is associated with significant morbidity and mortality (in-hospital 14-22%). Early and accurate diagnosis is essential to prevent negative outcomes. The modified Duke criteria is a validated diagnostic tool, however it must be used along with clinical

judgement and in context of pre-test probability. Our case signifies that physicians should have a low threshold for initiating therapy if the clinical presentation suggests IE even in the absence of Duke criteria.

DISCUSSION: Infective endocarditis(IE) has significant morbidity and one-year mortality of 20-40% which makes timely diagnosis vital. Modified Duke criteria employs pathologic, clinical and imaging modalities to stratify patients as definite, possible or rejected IE. Given the poor prognosis without treatment, the sensitivity and specificity (each around 80%) of the modified Duke criteria are suboptimal. Echocardiography is the primary imaging modality used for diagnosis, however transesophageal echocardiography(TEE) can miss the diagnosis in up to 30% of cases. Clinicians should consider further imaging modalities such as CT if TEE is unrevealing in highly suspicious cases.

WHEN IT SOUNDS AND LOOKS LIKE LYMPHOMA AND IT'S NOT: A CASE OF SARCOIDOSIS PRESENTING AS LYMPHOMA

Songprod Lorgunpai; Craig Gordon. Boston Medical Center, Boston, MA. (Control ID #2702550)

LEARNING OBJECTIVE #1: Recognize night sweats, weight loss, lymphadenopathy, and hypercalcemia as manifestations of sarcoidosis

CASE: A 39 year old man presented with left flank pain. Urinalysis revealed 3+ blood and calcium oxalate crystals. CT abdomen/pelvis revealed a left obstructing 8mm kidney stone as well as extensive abdominal and pelvic lymphadenopathy concerning for lymphoma. The patient was admitted to the oncology service where in addition to left flank pain, the patient reported night sweats, decreased appetite, and 40 pound weight loss over the past few months. Physical exam revealed large bilateral axillary and inguinal lymphadenopathy, up to 3–4 cm in size. Labs showed a serum calcium of 10.9 mg/dL. CT thorax revealed diffuse mediastinal, hilar, pericardial, and axillary lymphadenopathy, as well as lung nodules. Excisional biopsy of a right axillary lymph node revealed non-necrotizing granulomas with no features of a lymphoproliferative disorder or epithelial tumor. Flow cytometry, histoplasma antigen, mycobacterial culture, and special stains for acid-fast bacilli and fungi were negative. Patient was diagnosed with sarcoidosis and started on prednisone 40 mg daily. Repeat imaging revealed significant improvement in lymphadenopathy and lung nodules. Repeat serum calcium was 9.3 mg/dL.

IMPACT: This case reveals the perils of premature closure of diagnostic thinking as all clinicians involved in the case were convinced he had lymphoma. It highlights the necessity to consider the complete differential diagnosis of the patient's systemic symptoms, laboratory, and imaging data.

DISCUSSION: Sarcoidosis is a granulomatous disorder with noncaseating granulomas in the numerous involved organs. Sarcoidosis involves the lung in over 90% of patients. However, sarcoidosis can involve any organ system, and up to 30% of patients present with extrapulmonary sarcoid. This patient presented with weight loss, night sweats, and diffuse lymphadenopathy concerning for lymphoma but an estimated 15% of patients with sarcoidosis will have peripheral lymphadenopathy. Constitutional symptoms such as weight loss and night sweats occur in about 30% of patients with sarcoid. Hypercalcemia is observed in 10% of patients with sarcoidosis but 40% have hypercalciuria, leading to calcium-oxalate kidney stones, as seen in this patient. Lymph node biopsy can help differentiate sarcoidosis from lymphoma. However, a biopsy cannot definitively diagnosis sarcoid, as sarcoid granulomas have no unique histologic features to differentiate them from other granulomas. When this patient's biopsy revealed non-necrotizing granulomas, it was important to exclude the alternative possibilities of malignancy, mycobacterial, or fungal infections prior to diagnosing sarcoidosis and starting corticosteroid treatment.

WHEN KNOWLEDGE MAY NOT EMPOWER: THE CASE OF AN INCIDENTAL ABDOMINAL MASS

Shiyun Chua; Elizabeth Hutton. Boston Medical Center, Cambridge, MA. (Control ID #2690062)

LEARNING OBJECTIVE #1: Describe an unusual case of asymptomatic small lymphocytic lymphoma

LEARNING OBJECTIVE #2: Discuss the challenge of "incidentalomas" in the context of medical overuse

CASE: A 68 year-old man was sent to the hospital from urgent care due to severe crampy epigastric pain, vomiting and diarrhea, and new bradycardia. Exam revealed a diaphoretic male with epigastric tenderness and a heart rate in the 40s. Labs, including CBC, hepatic and renal function, were unremarkable. CT angiogram, ordered to rule out aortic dissection, instead showed a 7.5cm mesenteric mass adjacent to the descending colon and multiple enlarged mesenteric lymph nodes. Further testing, including CA19-9, CEA, LDH, beta-2-microglobulin, and serum protein and immunofixation electrophoresis, was normal. IR-biopsy of the mass revealed small mature B-cells consistent with small lymphocytic lymphoma (SLL). Hospital course was otherwise uneventful, with swift resolution of symptoms. Subsequent outpatient evaluation, including PET-CT and colonoscopy, revealed no blood involvement or other disease sites. He had no recurrence of initial symptoms. Given asymptomatic benign disease, the hospital tumor board recommended continued observation.

IMPACT: This case illustrated for me the challenge of an "incidental finding" in terms of potential medical overuse and the impact on my own decision-making in future similar cases.

DISCUSSION: This patient presented with a common nonspecific complaint that was short-lived and resolved without intervention, suggesting a benign cause e.g. viral gastroenteritis. The abdominal mass discovered as part of the workup was incidental, but sparked off a battery of tests resulting in the diagnosis of an indolent disease not necessitating any intervention. SLL is a relatively benign chronic lymphoproliferative disorder, synonymous to chronic lymphocytic leukemia (CLL) but for the lack of lymphocytosis. Management options of resection and radiation therapy may pose more risk than benefit. This case illustrates the challenge of "incidentalomas" for clinicians. On one hand, identifying SLL allowed monitoring for future progression. Yet, given the low risk of progression, the patient may have been subjected to unnecessary iatrogenic harm, including radiation, an invasive procedure, and the emotional stress caused by a cancer diagnosis. As high-value care has become a priority in medicine, there is increased attention to medical overuse, defined as "health care where potential for harm exceeds possible benefits". Factors contributing to medical overuse include fear of malpractice litigation and cognitive bias that "more is better". The phenomenon of "investigation momentum" has also been identified, when an ambiguous test result sparks a self-propelling cascade of further testing. Although a number of efforts have been launched to curb medical overuse, there is a need for further research and focus on high-value care curriculum in residency, particularly with the anticipated shift to capitated payments.

WHEN OLD CLOTS PRESENT LIKE NEW ONES Eesha Khan2; Asad H. Khan[2]; Vikram Grewal[2]; Mitkumar Patel[1]. [1]Baystate Medical Center, Springfield, MA; [2]Baystate Medical Center, Springfield, CT. (Control ID #2707285)

LEARNING OBJECTIVE #1: Identify key clinical and radiographic features of chronic thromboembolic pulmonary hypertension (CTEPH).
LEARNING OBJECTIVE #2: Discuss the management of CTEPH.
CASE: 51 year old female with a history of bilateral pulmonary emboli diagnosed five years ago and long-standing myasthenia gravis presented with pleuritic chest pain and dyspnea for three days. Physical examination was significant for tachycardia, new-onset hypoxia, jugular venous distension and a holosystolic murmur at the left sternal border. Initial work-up revealed an elevated D-dimer and a normal chest X-ray. She was initially suspected to have recurrent acute pulmonary embolism (PE) and a CT pulmonary angiogram (CT-PA) was done. CT-PA was negative for an acute PE but showed a small pericardial effusion, evidence of right heart dysfunction and a chronic calcified thrombus in the distal right pulmonary artery. Transthoracic echocardiogram (TTE) showed a moderate-sized pericardial effusion, severe right ventricular (RV) dysfunction with right-to-left septal shift, severe pulmonary hypertension (PH), severe tricuspid regurgitation and a right atrial thrombus. She was diagnosed to have chronic thromboembolic hypertension (CTEPH) complicated by RV failure and right atrial thrombosis. She was urgently referred to a CTEPH center where she underwent bilateral pulmonary thromboendarterectomy (PTE), tricuspid valve repair and right atrial thrombectomy. Repeat TTE showed a decrease in RV size, improvement in pulmonary artery (PA) pressures from 122 mm Hg to 54 mm Hg and resolution of the pericardial effusion. Post-operative ventilation/perfusion (V/Q) scan showed interval improvement in perfusion bilaterally, with persistent defects in left upper and right lower lungs. She was sent home on riociguat and warfarin.
IMPACT: This case highlighted the importance of evaluating for CTEPH when a patient with a prior PE presents with progressive dyspnea, once other common causes are excluded.
DISCUSSION: CTEPH is a treatable and potentially curable form of pulmonary hypertension. Early diagnosis and referral to a CTEPH center is crucial for improved prognosis. Typically, patients present with progressive dyspnea and exercise intolerance, in the setting of a prior PE. A V/Q scan, right heart catheterization (RHC) and pulmonary angiography are key diagnostic tests. Rarely, however, patients can be diagnosed with presumed CTEPH and referred for PTE without RHC and pulmonary angiography. In these patients, diagnosis can made with echocardiographic findings plus either CT-PA or magnetic resonance imaging (MRI) abnormalities, as in the case above. The cornerstone of treatment is PTE and lifelong anticoagulation. For inoperable or persistent CTEPH, medical therapies have recently come to the fore. Riociguat, a soluble guanylate cyclase inhibitor, is the preferred drug for persistent CTEPH. While our patient showed a dramatic improvement in PA pressures, she had residual PH and some persistent filling defects on V/Q scan and was therefore started on riociguat.

WHEN PNEUMONIA IS NOT WHAT IT SEEMS - A CASE OF AMIODARONE INDUCED LUNG INJURY Edmond Fomunung. UT Southwestern Medical School, Dallas, TX. (Control ID #2687952)

LEARNING OBJECTIVE #1: Diagnose amiodarone induced pulmonary toxicity
CASE: A 83-year-old woman with a history of atrial fibrillation on amiodarone 200mg/day for 8 years presented with report of a non-productive cough of approximately 1 week's duration. She was noted to febrile and hypoxic with an elevated white blood cell count. A chest xray was significant for confluent airspace consolidation in the right upper lobe, as well as within the left perihilar and lower lung zones, and small bilateral pleural effusions, all suggestive of multifocal pneumonia. She was started on empiric antibiotics for community acquired pneumonia. By the third day of hospitalization, there remained no clinical improvement. She continued to be hypoxic and leukocytosis continued to worsen. A CT scan of the chest showed patchy areas of groundglass, septal thickening, volume loss, scattered parenchymal bands and subpleural poorly defined nodular opacities. Transbronchial lung biopsy showed fibrous nonspecific interstitial pneumonia (NSIP) and organizing pneumonia, both related to amiodarone induced pulmonary toxicity.
IMPACT: Amiodarone induced pulmonary toxicity presents in myriad ways, including interstitial pneumonitis and organizing pneumonia, as in our patient. This pathology should always be suspected in patients with a history of amiodarone use, and particularly when there is no response to standard microbial therapy if pneumonia is initially suspected.
DISCUSSION: Amiodarone is the most widely prescribed antiarrhythmic in the United States, and a mainstay in the management of atrial fibrillation. The use of amiodarone is however complicated by its myriad side effects, with pulmonary toxicity being among the most adverse side effects of amiodarone use. Amiodarone induced lung injury comes in several forms including interstitial pneumonitis, organizing pneumonia, acute respiratory distress syndrome, diffuse alveolar hemorrhage, pulmonary nodules, solitary masses and pleural effusions. Interstitial pneumonitis is the most common of these presentations. The risk factors for development of toxicity may include duration of therapy, cumulative dose, daily dose usually greater than 400mg/day and pre-existing lung disease. Plain radiographs usually show new, diffuse or localized reticular, ground glass and mixed opacities. High resolution computed tomography should be obtained, and in the case of interstitial pneumonitis, may show areas of high attenuation in the lungs, specific for amiodarone toxicity. While not necessary, a lung biopsy is the gold standard in the diagnostic evaluation. Organizing pneumonia, another feature of amiodarone pulmonary toxicity, is present in approximately 25% of cases. It is suggested by acute or subacute onset mimicking pneumonia, patchy consolidative opacities on imaging and no response to antimicrobial therapy. A lung biopsy is needed to establish the diagnosis. Management involves discontinuation of amiodarone and generally a course of systemic glucocorticoid therapy.

WHEN SEVERE HYPOTENSION ISN'T SEPSIS Sophia Chang; Heather L. Briggs. University of Texas Health Science Center at San Antonio, San Antonio, TX. (Control ID #2701616)

LEARNING OBJECTIVE #1: Recognize causes of severe hypotension
LEARNING OBJECTIVE #2: Recognize the influence that cognitive bias may have on medical decision making
CASE: A 52 year old man with a past medical history of type 2 diabetes mellitus, and hypertension was admitted for pre-syncope. He had woken up feeling as if he was going to faint. EMS was called and he was brought to the hospital. On admission, his examination revealed significant hypotension (74/

42). His physical exam was otherwise unremarkable. Laboratory studies demonstrated white blood cell count 16K, creatinine 2.8 (baseline 0.8), and lactic acid 3.7. He initially received 3L of IV fluids as well as vancomycin and ceftriaxone for possible sepsis. His mean arterial pressure (MAP) was initially greater than 60 and soon dropped. He was pending transfer to the ICU for vasopressor support while he received an additional 2L of fluid. Vasopressor support was not needed as the MAP remained above 60. With a Sequential Organ Failure Assessment (SOFA) score of 3 and a concern for an occult infection, sepsis was at the top of the differential. Further studies including urinalysis, chest x-ray, and blood cultures were all negative for infection. Upon review of his home medications, he reported the recent initiation of canagliflozin. On repeat questioning, the patient reported increased urinary frequency since initiation of his medication. Given the lack of infectious source, and the resolution of his hypotension and acute renal failure with fluids, it was thought that canagliflozin was the culprit.

IMPACT: When the patient initially presented, the diagnosis was sepsis, but this was not supported by other clinical data. The primary team had to overcome the anchoring effect, which is when a provider will rely on the initial information, i.e. "anchor," to make ensuing decisions. The team had to overcome this bias to effectively diagnose the patient. This experience challenged the team to be more aware of anchoring bias and gather all the data of the admission to develop a differential diagnosis.

DISCUSSION: Canagliflozin is a SGLT-2 inhibitor that leads to increased urinary excretion of glucose which can contribute to significant hypovolemia. In this particular case, acknowledging the anchoring effect and re-evaluating the patient, allowed the team to recognize the side effects of canagliflozin as a potential cause of the clinical symptoms. This prevented the patient from receiving unnecessary antibiotics for a prolonged period of time. In a recent article, Tobler et al., described a database review that identified that cognitive bias was associated with diagnostic decisions. Recognition of these biases, including the anchoring effect, and the possible influence on decision making is an important part of education in clinical reasoning.

WHEN THE RULES DON'T APPLY: ANTICOAGULATION IN PATIENTS WITH INFECTIVE ENDOCARDITIS AND EMBOLIC STROKE Leah Harvey; Jonathan Ohm; Samantha Zullow; Frank Schembri. Boston Medical Center, Boston, MA. (Control ID #2671292)

LEARNING OBJECTIVE #1: To discuss the indications for anticoagulation in the setting of endocarditis and stroke

CASE: Case 1: 26 year old female with HCV and IVDA presented with tachycardia, a IV/VI apical systolic murmur with palpable thrill, Janeway lesions, weak left radial and ulnar pulses, and cyanosis of her left hand. Blood cultures grew MSSA, E. faecalis, Pseudomonas aeruginosa, and Bacillus subspecies. TEE confirmed mitral valve endocarditis. Duplex arteriography revealed occlusive thrombi at her left brachial and radial arteries, requiring embolectomy. CT demonstrated septic emboli to her lungs, kidneys, spleen, and brain, including a right prefrontal gyrus embolic stroke. She was treated with therapeutic heparin, as it was felt that the benefit of preserving perfusion to her left arm and avoiding necrosis outweighed the risk of conversion from embolic stroke to intercerebral hemorrhage (ICH). Case 2: 34 year old male with HCV and IVDA presented with tachycardia, tachypnea, III/VI systolic murmur at the left sternal border, and bilateral upper extremity wounds. Blood cultures grew MRSA, E. coli, and Strep. constellatus. TEE revealed vegetations at the tricuspid valve, right ventricular outflow tract, and the sinus of valsalva. CTPA demonstrated cavitary lesions and pulmonary emboli (PE). Further imaging revealed septic emboli to his spleen, kidneys, and frontal lobe. His admission was further complicated by GI bleed and respiratory failure requiring intubation. It was determined that the risk of hemorrhagic conversion (HC) outweighed the benefit of treating the PEs, particularly given concern for GI bleed, and both therapeutic and prophylactic heparin were held.

IMPACT: As these patients with IE and embolic stroke demonstrate, anticoagulation may be indicated to treat limb ischemia or PE, but benefits should be carefully balanced with inherent risk of HC.

DISCUSSION: Patients with Infective Endocarditis (IE) are at high risk for embolic events, including embolic stroke. Risk factors for embolization include: vegetations >1cm, Staph. aureus endocarditis, delay in effective antibiotic therapy, and comorbidities such as atrial fibrillation. Early surgical intervention has been found to be beneficial in patients with ongoing thrombotic events despite antibiotic therapy, although such patients are often unstable and poor surgical candidates. Current guidelines recommend anticoagulation in patients with typical indications, such as mechanical valves or atrial fibrillation. However, for patients with thromboembolism, guidelines are less clear. Experts suggest that the risk of complications from withholding anticoagulation be balanced against the risk of bleeding, particularly the risk of HC of acute stroke. In an acute care setting, patients are often sedated and neurologic exams are difficult to perform. Therefore, if anticoagulation is used, serial imaging should be performed to monitor for HC of septic emboli in the brain.

WHERE HAS ALL THE BICARB GONE?: AN UNRESPONSIVE PATIENT AND AN UNKNOWN INGESTION William L. Vail; Shwetha Iyer. Montefiore Medical Center, Bronx, NY. (Control ID #2706323)

LEARNING OBJECTIVE #1: Recognize the clinical presentation of topiramate toxicity

LEARNING OBJECTIVE #2: Identify topiramate toxicity as a potential cause of hyperchloremic non-anion gap metabolic acidosis

CASE: A 23 year-old obese woman was brought to the emergency department by EMS after ingesting an unknown quantity of medication. She was in her usual state of health 12 hours previously but was later found collapsed at home. Vital signs were normal. She was difficult to arouse and did not follow simple commands. She would open her eyes and withdraw from noxious stimuli. Her pupils were 4mm bilaterally and sluggishly reactive. Reflexes were +2 and symmetric. Labs revealed a bicarbonate of 11 mEq/L and chloride of 116 mEq/L with an anion gap of 16. Arterial blood gas revealed a pH of 7.33, pCO2 26mmHg. Serial EKGs showed normal sinus rhythm with normal QRS intervals. Nortriptyline, acetaminophen, and salicylate were undetectable in the serum. Valproic acid levels were within normal limits. The topiramate level was 33.8 mcg/ml 24 hours after ingestion (Reference range for psychiatric use 2.0 - 8.0 mcg/ml).

IMPACT: General internists are often confronted with the difficulties of identifying drug ingestions. Physical exam and lab abnormalities become paramount to diagnosis and treatment when an accurate history of potential ingestions cannot be obtained.

DISCUSSION: Topiramate is a sulfamate-substituted monosaccharide anticonvulsant medication used to treat various seizure disorders and, more

recently, as a mood stabilizer. It is thought to inhibit voltage-sensitive sodium and calcium channels and potentiate gamma-aminobutyric acid (GABA) mediated chloride currents. It also selectively inhibits two isoenzymes of carbonic anhydrase found in the glial cells of the brain and in proximal tubules of the kidney. The most common symptoms of topiramate toxicity are somnolence, dizziness, ataxia, and diplopia. Psychosis, hepatic failure, encephalopathy, hyperthermia, nephrolithiasis, paresthesia, and seizures have also been reported. Most cases resolve within 48 hours with no long-term sequelae. Rarely, coma and death due to overdose have been reported. The most consistent lab abnormality found in topiramate toxicity is metabolic acidosis due to the inhibition of carbonic anhydrase, leading to loss of bicarbonate in the proximal tubules, and subsequent retention of chloride to sustain electrical neutrality. Thus, topiramate toxicity often presents with a hyperchloremic non-anion gap metabolic acidosis, consistent with a Type 2 renal tubular acidosis. Urine pH may be high in the immediate setting of toxicity. A positive urine anion gap can also be seen due to chloride and ammonia ion retention as well as the inability of the kidney to reabsorb bicarbonate. Clinicians should recognize these unique pathopharmacological aspects of the drug topiramate, especially when other substances are eliminated as potential causes as it can help in distinguishing the presentation of its toxicity.

WHERE O WHERE ART THOU ANEURYSM Gray Jodon[2]; Timothy Miller[3]; Chi Zheng[1]. [1]Denver Health, Denver, CO; [2]University of Colorado, Denver, CO; [3]University of Colorado School of Medicine, Loveland, CO. (Control ID #2704085)

LEARNING OBJECTIVE #1: Diagnose PAN (polyarteritis nodosa) without biopsy

CASE: A 42 year-old man with a history of recent hepatitis B virus (HBV) infection, hepatitis C, and IV drug abuse presented from an outside hospital (OSH) with abdominal pain for one month and concerns for necrotizing pancreatitis. CT at the OSH revealed ovoid pancreatic hypodensities, splenic infarcts, bilateral renal infarcts, and possible splenic vein thrombosis. Physical exam was significant for diffuse abdominal tenderness to palpation, testicular pain with palpation, and decreased sensation in bilateral lower extremities. The above imaging combined with a normal lipase was not consistent with necrotizing pancreatitis. Serologic testing for lupus, Sjogren's syndrome, anti-neutrophilic cytoplasmic antibody (ANCA) related vasculitis, anti-phospholipid antibody syndrome, IgG4 related disease, multiple myeloma, HIV, and paroxysmal nocturnal hemoglobinuria were unrevealing. Blood cultures were negative and echocardiography did not reveal a cardioembolic source. CTA of the abdomen revealed no evidence of aneurysms of the small and medium vessels. Our differential involved vascular phenomenon, including thrombotic, embolic and vasculopathic causes. Given his recent history of HBV, PAN was high on the differential. A repeat CTA on hospital day 7 revealed renal artery aneurysms suggestive of PAN. Biopsy was deferred as the patient met American College of Rheumatology diagnostic criteria for PAN. He was discharged on tenofovir and prednisolone, but was readmitted 4 days later for cardiogenic shock due to stress induced cardiomyopathy related to coronary aneurysms versus cerebral aneurysms. He was treated with plasma exchange with recovery of his cardiac function and resolution of his symptoms.

IMPACT: The patient's clinical presentation and evidence of aneurysms on CTA were used to meet the American College of Rheumatology's diagnostic criteria for PAN. The patient was able to forgo a biopsy due to the presence of aneurysms. Because biopsy is not required for diagnosis if aneurysms are present, imaging to evaluate for aneurysms in patients suspected to have PAN should be pursued prior to pursuing biopsy. This could ultimately lead to less patients requiring an invasive procedure.

DISCUSSION: PAN is an ANCA-negative, necrotizing vasculitis of the small to medium arteries without signs of glomerulonephritis or vasculitis of the arterioles, capillaries or venules. Approximately 20% of PAN cases are associated with hepatitis B virus (HBV) or hepatitis C virus (HCV) infection. Diagnosis requires angiographically proven aneurysms or biopsy with evidence of vasculitis in addition to certain clinical symptoms. In the presence of these symptoms and angiographic evidence of aneurysm, biopsy is not required for diagnosis. For HBV-associated PAN, treatment should be aimed at the viral infection in addition to immunomodulatory therapy, such as plasma exchange, aimed at the associated inflammation.

WHY IS THE CALCIUM STILL SO HIGH? - ACCIDENTAL HYPERVITAMINOSIS D IN A HEALTHY YOUNG MALE TAKING DIETARY SUPPLEMENTS Erica C. Dwyer. Cambridge Health Alliance, Somerville, MA. (Control ID #2709594)

LEARNING OBJECTIVE #1: Recognize and treat excessive vitamin D supplementation.

CASE: A 35 year old male with history of anxiety presents to the emergency room with vomiting, dehydration, decreased appetite, weakness, and dizziness for 2–3 weeks. His sister is also ill, and he recently attended a church meal. He reports treating his symptoms with marijuana, as well as dietary supplementation for GI health with boric acid, chia seeds, concentrated Vitamin D powder and diametacious earth, all purchased online. His physical exam was unremarkable. BMP and CBC were normal, but his Ca was found to be elevated at 14.2 mg/dl. Renal function was normal, Serum PTH was low; PTH-rp was negative, Vitamin D, 25 hydroxy >150 ng/ml. With aggressive hydration the Ca level improved to 12.4 mg/dL and he was sent home with instructions to avoid further supplements and calcium containing products. He was readmitted 2 days later with renewed symptoms and a higher Ca of 15.8 mg/dl. He now received Zoledronic acid and further hydration. By the second discharge he had a Ca of 8.9 mg/dl and was no longer receiving IV fluids. He felt much improved. Two weeks and 3 months after discharge his Ca levels remained normal. His Vitamin D level remained elevated (>150 ng/ml) a month after discharge. Even three months later the level was still an unusually high 90 ng/ml.

IMPACT: This case highlights the availability of vitamin D at toxic doses and the importance of taking a supplement history. It also shows the prolonged time course of Vitamin D elimination and demonstrates the importance of treating both acute hypercalcemia (with IV hydration) and delayed hypercalcemia (with bisphosphonates). There are prior reports of accidental hypervitaminosis from incorrect Vitamin D dosing; this case reveals another dangerous source of excessive Vitamin D intake: the internet.

DISCUSSION: Elevated calcium caused by hypervitaminosis can persist and continue to rise for several weeks as Vitamin D levels remain high and continue to stimulate mobilization of calcium to the blood stream from the bone. In this case the patient's inpatient providers did not initially anticipate to what extent his calcium levels would continue to rise even after early inpatient stabilization. IV bisphosphonates were used to prevent this when he required admission a

second time. Estimates revealed that the patient had most likely ingested around 6 million units of Vitamin D within a few weeks. He liberally sprinkled Vitamin D powder (which he had purchased from the internet to promote bone health) on his food and was unaware of the total amount he was consuming and its potential side-effects.

YERSINIA POLYARTHRITIS IN A YOUNG ADULT Mariella Ntamatungiro. Weill Cornell Medical College-New York Presbyterian Hospital, New York, NY. (Control ID #2707408)

LEARNING OBJECTIVE #1: Recognize the broad differential of Polyarthritis in a Young Adult

LEARNING OBJECTIVE #2: Review the Epidemiology, Clinical Features, Pathophysiology of Yersinia Polyarthritis

CASE: 24 year old male presents with a migratory polyarthritis of the left knee, hip and elbow. He reported a sore throat and cough 1 week prior and a recent episode of unprotected oral sex. He denied diarrhea, rash, tick bites, fever, chills, nausea or vomiting. He was afebrile with tender, erythematous joint effusions of the left hip, elbow, and knee with decreased range of motion secondary to pain. Oropharynx was without erythema or exudates. Knee aspiration had a cell count of 20K, mostly polymorphic neutrophils with negative gram stain and culture. Imaging demonstrated large joint effusions of knee and hip. Urine, urethra, rectal samples were collected and Ceftriaxone therapy was started. Samples returned negative for gonorrhea and chlamydia with no clinical improvement. Ceftriaxone was stopped. Extensive infectious workup returned negative including tuberculosis, Beta hemolytic streptococci (A,C,G),HIV, Hep A,B,C, CMV, EBV, Parvo B19,Rhinovirus, and Enterovirus. Blood and urine cultures were negative. Empiric steroid therapy was started. Yersinia Entercolitica stool PCR and HLA B27 were positive. Patient clinically improved on steroids and was discharged home with a steroid taper.

IMPACT: Clinicians should broaden polyarthritis differential in a sexually active adult beyond gonorrhea to include GI pathogens which commonly cause reactive arthritis. Yersinia is the only GI pathogen that causes pharyngitis. Post infectious arthritis from Yersinia can occur after resolution of diarrhea and can be absent from history. Yersinia stool PCR can return positive after resolution of diarrhea.

DISCUSSION: Reactive arthritis is commonly caused by GI and urogenital pathogens such as Yersinia, Shigella, Campylobacter, Ecoli, C.diff, Chlamydia and Gonorrhea. Other Infectious causes include Staph aureus, Group A strep,Hep A,B&C, HIV, Rubella, Parvo, Alpha virus, Dengue, Mumps, EBV, Cocksakie and Adenovirus. Yersinia enterocolitica is the only acute bacterial diarrheal illness that also causes pharyngitis. Twenty percent of Yersinia infections present with sore throat.The post infectious sequelae often present several weeks after resolution of diarrhea and shedding of Yersinia can continue resulting in a positive stool PCR. It targets the large weight bearing joints with swelling, effusions and pain. The time course varies from being self-limited to lasting few months with few cases persisting as a relapsing chronic polyarthritis with increased prevalence amongst Northern Europeans who are HLA-B27 positive. Yersinia is usually absent from the synovial fluid. There is antigenic similarity of yersinia antigens to antigens in the joints of certain susceptible people. It is believed that an immune response to yersina antigen cross react against host antigens.

ZEBRAS DRESSED AS HORSES: AN UNDER DIAGNOSED CAUSE OF ACUTE CORONARY SYNDROME

Kaylee J. Shepherd. UT Southwestern, Dallas, TX. (Control ID #2706715)

LEARNING OBJECTIVE #1: Recognize risk factors for Spontaneous Coronary Artery Dissection (SCAD).

LEARNING OBJECTIVE #2: Diagnose SCAD in a young female patient.

CASE: Patient is a 40 year-old Hispanic female with history of cesarean section four weeks prior complicated by pulmonary embolism (PE) one week postpartum on treatment with Lovenox who presented with chest pain. The pain began 12 hours earlier after eating breakfast, described as substernal, pressure pain, associated with radiation down the left arm, occurred with both exertion and at rest, and was intermittent, lasting only a few min. Other than her PE, she has no medical history. Upon presentation, EKG was notable for new ST depressions in the lateral leads and troponin T <0.01ng/mL. A CT pulmonary angiogram was performed showing resolution of her PE. Repeat troponin overnight was 0.52ng/mL in the setting of continued intermittent chest pain. Urgent left heart catheterization revealed a 99% occlusion in first obtuse marginal artery (OM1). Intravascular ultrasonography (IVUS) demonstrated a large dissection of OM1 with a hematoma and no evidence of atherosclerosis. Patient had successful balloon angioplasty of OM1 and was discharged with 1 month of clopidogrel followed by indefinite aspirin therapy.

IMPACT: When a young female patient without cardiovascular risk factors presents with chest pain, we might be quick to brush off the diagnosis of ACS and look for other etiologies of chest pain. Although SCAD is uncommon, this life threatening condition can present as chest pain alone, STEMI, ventricular arrhythmia, or even sudden death. It is important to have a high index of suspicion for SCAD, especially in a young peripartum female patient.

DISCUSSION: SCAD is defined as a separation of the inner layers of the coronary artery, creating a false lumen and intramural hematoma that can impede blood flow. SCAD is poorly understood. Patients are often healthy women in their 40-50s, most without atherosclerosis or other cardiovascular risk factors. 30% of all SCAD patients are postpartum, usually within a few weeks of delivery, suggesting a relationship to changes in hormone levels. Other notable risk factors are fibromuscular dysplasia, extreme physical exertion, connective tissue diseases, severe emotional stress, vasculitides, uncontrolled hypertension, and cocaine use. Patients present with symptoms indistinguishable from atherosclerotic ACS. Diagnosis can possibly be made on angiogram, however, IVUS or optical coherence tomography is usually needed. Without studies that specifically address the management of SCAD, it is unclear if standard medical management for atherosclerotic coronary heart disease is also beneficial in SCAD. Acute management is debated and the benefit of dual antiplatelet therapy in SCAD not treated with a stent is unknown.

ZIEVE'S SYNDROME AS A CAUSE OF HEMOLYTIC ANEMIA IN THE SETTING OF ALCOHOLIC CIRRHOSIS Connor M. Pihl[2]; Christopher Ghiathi[2]; Yana Thaker[2]; Nancy Simon[1]. [1]UWMC, Seattle, WA; [2]University of Washington, Seattle, WA. (Control ID #2710873)

LEARNING OBJECTIVE #1: Recognize the broad differential required in the evaluation of a patient with hemolytic anemia in the setting of alcohol abuse and liver disease.

LEARNING OBJECTIVE #2: Diagnose and manage Zieve's syndrome when common causes of hemolytic anemia have been ruled out to avoid unwarranted invasive diagnostic interventions.

CASE: A 38 year-old woman with alcoholic cirrhosis admitted for evaluation of hemolytic anemia. She was diagnosed with cirrhosis 6 weeks prior, after presenting with altered mental status and several months of worsening jaundice in the setting of alcohol abuse. At that time, she required blood transfusion with a hematocrit of 16.4g/dL, but had no signs of bleeding. She was referred to hepatology clinic for management, where it was noted that despite gradual improvement in AST/ALT, albumin, and INR, her anemia persisted and bilirubin increased to 17g/dL. Endoscopy revealed small varices and portal gastropathy, but again no evidence of bleeding. Additional testing showed a negative DAT, normal B12/folate, low haptoglobin, increased LDH, and high reticulocyte count consistent with non-autoimmune hemolysis. On admission, she was without subjective complaint, with a hematocrit of 16g/dL and bilirubin of 20g/dL. She denied any infectious symptoms and did not take medications or supplements prior to her initial presentation. She had no family history of anemia, and had been abstinent from alcohol since being diagnosed with cirrhosis. Physical exam was significant for profound jaundice and hepatosplenomegaly. Peripheral smear showed wildly appearing red blood cell morphologies, including many acanthocytes and macrocytes. Hematology was consulted and the patient was determined to have Zieve's syndrome given her hemolytic anemia in the setting of alcohol abuse and cirrhosis. She was managed with blood transfusion and B12/folate therapy to maximize bone marrow production. She was encouraged to remain abstinent from alcohol and discharged with primary care follow-up for ongoing monitoring and blood transfusion as needed.

IMPACT: Though first described in 1957, Zieve's syndrome has been under-reported in the English-language literature. It remains a rarely recognized cause of hemolytic anemia despite recent evidence that it is more common than previously thought.

DISCUSSION: Hemolysis in Zieve's syndrome is the result of erythrocyte cell membrane defects and acquired pyruvate kinase deficiency caused by alcohol-induced hepatocellular dysfunction. It is a diagnosis of exclusion that must be considered for a patient with hemolytic anemia and alcoholic hepatitis or cirrhosis, and should be ruled out prior to invasive diagnostic testing. While the definitive treatment is alcohol cessation, recovery requires improvement in liver function and thus can be slower in patients with more extensive disease. These patients should receive B12 and folate to maximize bone marrow production, and be followed closely in the outpatient setting with transfusions as needed.

ZOSTER TO THE MUSCLE Muhammad A. Saeed[2]; Sarabjeet Suri[2]; Yelena Averbukh[1]. [1]Montefiore Medical Center, Bronx, NY; [2]Montefiore Wakefield Campus, Bronx, NY. (Control ID #2703708)

LEARNING OBJECTIVE #1: To identify Herpes Zoster Virus (Varicella) as one of the etiology of rhabdomyolysis

LEARNING OBJECTIVE #2: To recognize complications of Varicella infection

CASE: A 73 year-old man with diabetes mellitus and hypertension presented with one week of low back pain and left-sided chest wall rash. He also reported myalgias, fatigue, and dark discoloration of urine. There was no report of a recent crush injury, trauma, or excessive exercise; his medication list did not contain a statin. He had vesicular lesions in the distribution of left T7 dermatome. Labs revealed serum potassium 5.2 mEq/L, acute kidney injury with creatinine 2.84 mg/dl, creatine kinase (CK) >80,000 U/L, aspartate aminotransferase (AST) 420 U/L, alanine aminotransferase (ALT) 264 U/L, and normal bilirubin. His thyroid stimulating hormone level was normal. The patient was treated with normal saline at 150 ml/hour with frequent monitoring of urine output, creatinine, and CK. The rash was diagnosed as Herpes Zoster, for which he was treated with Valacyclovir. Over the subsequent days, the skin lesions crusted and renal and liver function tests returned to normal. CK trended down to 7,510 U/L. He was discharged home with outpatient follow up with Nephrology team.

IMPACT: Varicella may be an underlying cause of rhabdomyolysis therefore due importance should be given to thorough history taking and complete skin examination. In addition, complaint of fatigue and severe myalgias in a patient with Herpes Zoster should raise suspicion for rhabdomyolysis which would warrant further testing and lead to correct diagnosis.

DISCUSSION: Rhabdomyolysis is a syndrome of skeletal muscle breakdown and necrosis resulting in the release of intracellular contents, most importantly CK and potassium. Clinically, rhabdomyolysis can be asymptomatic, though could be potentially life-threatening. Some of the most common causes of rhabdomyolysis are trauma/crush injury, alcohol abuse, illicit drug use, and medication induced. Lesser known causes include viral infections such as influenza virus, herpes simplex virus and varicella. Only a few case reports were found supporting the association between Varicella and rhabdomyolysis in immunocompetent hosts. The mechanism of injury is postulated to be skeletal muscle breakdown; the exact pathogenesis remains unknown. Herpes Zoster is a known sequel to the infection with Varicella virus and is due to viral reactivation from its latent state in a posterior dorsal root ganglion and typically presents with vesicular rash in the dermatome distribution. Zoster presentation may be complicated by painful neuropathy in the affected dermatome distribution or superinfection with other bacterial organisms. Other common complications include laryngitis and pneumonia; Pneumonia being the most common complication in immunocompetent hosts. Lesser known complication of localized presentation with Herpes Zoster is diffuse rhabdomyolysis. When associated with rhabdomyolysis, varicella is associated with higher mortality and morbidity.

INNOVATIONS IN MEDICAL EDUCATION (IME) "'SE HABLA ESPAñOL': UNDERSTANDING LANGUAGE BARRIERS FOR SPANISH-SPEAKING PATIENTS AND ENGAGING SPANISH-FLUENT RESIDENTS TO BRIDGE GAPS IN CARE." Christopher Moreland[1]; Julie R. Gilbreath[2]. [1]The University of Texas HSC - San Antonio, San Antonio, TX; [2]UTHSCSA, San Antonio, TX. (Control ID #2705544)

NEEDS AND OBJECTIVES: Texas has the second largest Hispanic population in the United States (U.S.) according to 2010 U. S. census data, which found that nearly 40% of the state population identifies as Hispanic. As this segment of the population continues to increase, the number of patients with limited English proficiency (LEP) has likewise increased, with 12% of Spanish speakers in Texas reporting they speak English less than "very well." Because of a paucity of Spanish-fluent providers, LEP patients often report increased

health disparities, worse clinical outcomes, and decreased patient satisfaction.[1,2] We will observe access to care and quality in our institution.

SETTING AND PARTICIPANTS: UTHSCSA internal medicine residents enrolled in the Spanish Language Access Elective during the PGY-2 or PGY-3 year observed and interacted with LEP patients in both the inpatient and outpatient setting at University Health System in San Antonio, Texas.

DESCRIPTION: Spanish fluency was assessed in the enrolled residents. They subsequently reviewed literature on health care disparities impacting LEP patients and the use of interpretation. They also participated in a brief immersive simulation representing a language barrier. Residents conducted interviews with Spanish-speaking patients to explore their experiences seeking medical care. Residents also observed four different types of interpretation: in-person professional Spanish interpreter, over-the-phone interpretation, trained bilingual health system staff interpretation, and video interpretation. Residents also had the opportunity to shadow professional interpreters and Spanish-speaking internists and subspecialists. They documented and discussed observations with the supervising faculty. At the end of the rotation, residents recorded a short video of themselves explaining disease processes or a procedure in Spanish as they would to a Spanish-speaking patient.

EVALUATION: Three residents have participated in this elective since it launched in 2015. Residents have shared their experiences in writing and through group discussions with faculty and interpreters. These discussions have also identified areas for practice improvement and engaged two residents in quality improvement projects.

DISCUSSION/REFLECTION/LESSONS LEARNED: Residents completing the elective reported increased awareness of health disparities and barriers to care for Spanish-speakers and their own limitations utilizing Spanish medical terminology. This Spanish Language Access Elective provides residents with the opportunity to observe a complicated and challenging health care system and how the LEP population in San Antonio navigates it, while simultaneously giving the residents the opportunity to assess their capabilities as medical providers themselves and effect change through quality and practice improvement. Since it capitalizes on resources and perspectives already present in our system (e.g., patients, other clinicians, interpretation services), this elective can be generalized to other programs.

"WHAT DID THEY SAY?" TEACHING HEALTH LITERACY AND COMMUNICATION SKILLS TO INTERNAL MEDICINE RESIDENTS TO IMPROVE THE PATIENT EXPERIENCE

Jill Allenbaugh[2]; Carla Spagnoletti[1]; Laurie Rack[2]; Jennifer Corbelli[2]. [1]University of Pittsburgh, Pittsburgh, PA; [2]University of Pittsburgh Medical Center, Pittsburgh, PA. (Control ID #2699461)

NEEDS AND OBJECTIVES: Residents are often considered the frontline doctors on general medicine inpatient services and responsible for most of the doctor-patient communication. Our inpatients indicated on satisfaction surveys that there was room for improvement on the item, "My doctors explained things to me in a way that I could understand". We hypothesized that the reasons for this communication gap were residents' lack of adequate training in bedside communication skills and difficulty in recognizing poor health literacy among inpatients. Efforts aimed at clear communication can lead to improved patient care outcomes and satisfaction. Thus, we developed a curriculum for residents that focuses on effective tools for clear communication of medical information to patients on bedside rounds.

SETTING AND PARTICIPANTS: Participants included all senior ($N = 120$) internal medicine and internal medicine-pediatric residents at the University of Pittsburgh Medical Center, where residents are at the helm of the general medicine inpatient daily bedside rounds.

DESCRIPTION: Participants attended a 3-hour workshop in June 2016 led by internal medicine clinician educators which included didactics outlining clear communication techniques, including, asking "what questions do you have?" which is the standard accepted method to elicit patient questions in the literature. The intervention also involved small group discussion, role play, and video demonstration of simulated bedside rounding conversations. Attendings were introduced to the curriculum and asked to reinforce its content in real time.

EVALUATION: 75/120 residents attended (participation 63%) and 96% of those who attended completed pre/post surveys to evaluate knowledge and attitudes. Knowledge scores improved from 71.4 to 85.7% correct ($p < .0001$). Attitudes also improved, including the importance of translating medical information for patient care (Likert scale where 1 = Not important and 5 = Very important, mean pre 4.56 vs post 4.81, $p = .0001$) and for satisfaction (4.54 vs 4.81, $p < .0001$), introducing self and role (4.06 vs 4.56, $p < .0001$), and asking the patient "what questions do you have?" (4.82 vs 4.87, $p < .0001$). Objective communication skills were measured by comparing 333 pre and post workshop observations of bedside rounds using a standardized checklist. Observed communication skills improved, including residents introducing themselves to the patient (49% vs 67%, $p = .001$), using plain medical language when giving medical information (89% vs 96%, $p = .018$), and asking "what questions do you have?" (16% vs 59%, $p < .0001$).

DISCUSSION/REFLECTION/LESSONS LEARNED: Our results demonstrate the impact of this intervention across all outcomes assessed and shows a small investment of curricular time devoted to health literacy and clear communication can significantly and objectively increase residents' ability to translate medical information, and improve their knowledge and attitudes in these domains. This intervention can be readily disseminated to improve bedside patient communication and ultimately the patient experience.

PUTTING THE PIECES TOGETHER: TEACHING PATIENT SAFETY USING THE JIGSAW MODEL

nirvani goolsarran; carine hamo. stony brook university hospital, Stony brook, NY. (Control ID #2704826)

NEEDS AND OBJECTIVES: As the learning environment becomes increasingly more complex, it is often challenging for educators to find innovative strategies to engage learners and effectively teach patient safety. Teaching and learning patient safety requires strong emphasis on diagnostic errors, teamwork and building a culture of trust and dependability. The objective of this study was to design and implement a patient safety learning exercise using the simple jigsaw technique and compare this method with the traditional small group exercise to teach principles of diagnostic errors.

SETTING AND PARTICIPANTS: The study took place at Stony Brook University Hospital. Participants included 96 internal medicine residents

DESCRIPTION: Each session began with a written mortality script of a medical error. After reading the mortality script, the intervention group using the jigsaw method was organized into 4 jigsaw groups of 4 trainees each. Each member of the group was assigned to a different reading piece related to error analysis: A) Anatomy of a medical error, B) Three "A" errors, C) Other

cognitive pitfalls, or D) cognitive de-biasing strategies. Group members then joined members of other groups assigned to the same reading piece with the goal of becoming experts in the topic by using a guiding question template. Eventually, trainees leave their expert groups and return to their original groups to "piece together" a structured cognitive root cause analysis using a modified fishbone diagram and action plan for the error described in the case. The control group received the same content in a small group format using the same amount of allotted time one faculty facilitator per group. Trainees completed pre/post knowledge assessment test for both the intervention group (jigsaw method) and control group (small group exercise). TeamSTEPPS Teamwork Attitudes Questionnaire (TAQ) before and after the workshop and a post-workshop satisfaction survey.

EVALUATION: A total of 96 internal medicine trainees of all PGY levels participated in the activity, 48 residents participated in the intervention and 48 residents participated as the control group. The data is currently being analyzed and will be ready in time for the poster presentation. We anticipate higher posttest and TAQ scores in comparison to pre-test scores for the intervention and control groups. Additionally, we anticipate a greater delta in the jigsaw intervention group in comparison to the control group. Results are pending as to the Likert scale ranking of the jigsaw model versus the traditional small group format when it comes to learning patient safety.

DISCUSSION/REFLECTION/LESSONS LEARNED: Our study demonstrates that a jigsaw cooperative learning approach can be a unique technique to engage trainees to learn core concepts of patient safety. The jigsaw method emphasizes peer teaching and can be used with one facilitator as opposed to small group exercises that require many facilitators. This model of teaching uses fewer resources and also emphasizes the importance of teamwork and cooperative learning.

2PM FREE MASSAGE: LEADING SUSTAINABLE ORGANIZATIONAL CHANGE AND PREVENTING BURNOUT VIA A STRATEGIC IMPLEMENTATION OF A FREE THERAPEUTIC MASSAGE SERVICE IN A COUNTY INTERNAL MEDICINE RESIDENCY PROGRAM Kin Wai Hung[2]; Guilianne Morden[2]; Duminda Suraweera[1]; Erica V. Tate[1]; Soma Wali[1]. [1]Olive View UCLA Medical Center, North Hollywood, CA; [2]Olive View - UCLA Medical Center, Sherman Oaks, CA. (Control ID #2706297)

NEEDS AND OBJECTIVES: Burnout rate has reached epidemic levels among medical residents in the newest studies presented at the 2015 American Psychiatric Association Annual Meeting. Results revealed that internal medicine residents have in fact one of the highest burnout rate (79%). While multifaceted strategy and interventions have been proposed to address burnout for medical residents, current data on interventions for physician burnout are insufficient to recommend particular measures, as more studies are needed to examine the applicability and utility of these interventions in resident physicians.

SETTING AND PARTICIPANTS: In a collective effort to promote workplace wellness and prevent resident burnout in a County hospital setting, management team including Chief Residents and Department Chair from an internal medicine residency program teamed up to take action to improve the workplace environment via a strategic implementation of a twice weekly, free therapeutic massage service.

DESCRIPTION: Successful implementation of the massage service included three key stages. First, a needs-assessment on resident burnout was conducted that led to the eventual buy-in from key stakeholders including administrative approval to implement the therapeutic massage service. Second, local massage teaching institution was contacted to establish strategic collaboration to allow consistent massage training and in return free massage service provided for residents. Finally, operation of massage service was provided in easily assessable location at the resident lounge, service capacity was limited to 20 min interval for total of 3 hours daily, and service scheduling streamlined via Doodle, a free online scheduling tool. A total implementation cost of $150 was spent on the purchase of a dedicated massage chair.

EVALUATION: Utilization data from Doodle and quality data from focus group survey was obtained for analysis. Of the total 168 massage sessions in the first 12 weeks since launching, massage service was utilized at 80 to 100% daily capacity. Approximately 90% of all 75 residents in the residency program have utilized the massage service at least once, and up to 40% of all residents has utilized the service at least twice. Preliminary focus group analysis revealed that residents enjoy the wellness atmosphere created by the massage service in the workplace setting, that the notion of having an onsite massage service reminds residents to make time during work hour to be mindful of their stress level, and that the massage service not only provided a restful mental break, but also a physical rejuvenation for residents.

DISCUSSION/REFLECTION/LESSONS LEARNED: Please see Impact section as below

A COACHING PROGRAM FOR FACULTY DEVELOPMENT IN PRESENTATION SKILLS Jeremy Smith; Laura Zakowski. University of Wisconsin, Madison, WI. (Control ID #2700852)

NEEDS AND OBJECTIVES: Peer coaching, often used to improve skills of medical faculty, involves three principles: direct observation, targeted feedback and deliberate practice. Studies show these principles improve clinical skills, but how they might impact presentation skills is less clear. Many faculty give large-group presentations that require capturing and maintaining audience attention, but have never received any relevant training. Feeling ineffective is linked to burnout and programs to improve feelings of competence could facilitate resilience. We assessed the effect of peer coaching principles on faculty presentation skills.

SETTING AND PARTICIPANTS: Our weekly Medicine Grand Rounds involves a one-hour talk on a clinical or research topic. All members of the Department of Medicine are invited, with 75–125 usually attending. Roughly 12 junior faculty (Assistant Professors) are scheduled to present each year. Between Sept 2015 and Dec 2016, each was offered coaching prior to presenting

DESCRIPTION: Junior faculty were paired with a peer coach. One week prior to Grand Rounds, the speaker and coach met in the auditorium for a practice run. The coach observed the presentation with a locally-developed evaluation tool assessing: speaking techniques (use of voice, gestures, pauses, movement; avoidance of non-words), optimal PowerPoint use, development of a dynamic learning climate (physical/emotional), establishment and communication of teaching goals, and techniques to promote audience understanding and retention. After receiving feedback on specific behaviors, the presenter repeated parts of the talk (i.e. deliberate practice) to improve skills. Coaching lasted 1–1.5 h.

EVALUATION: Twelve of 14 junior faculty scheduled to give Grand Rounds participated. Each evaluated the coaching program and completed measures of self-assessed skill and confidence after the final presentation. They reported improved skills (mean 9.0 on 1–10 scale, 10 = skills much improved), more comfort delivering a large-group talk (mean 8.8), and felt somewhat more likely to engage in future speaking opportunities (mean 6.9). All would strongly recommend the coaching program (mean 10.0). When queried how their presentations changed, the most frequent answers were: more succinct, organized slides; use of pauses, gestures, movement, and eye contact to increase energy and engagement; use of a catchy opening statement and first slide; and effective/appropriate use of slide animation.

DISCUSSION/REFLECTION/LESSONS LEARNED: Participants found the coaching program effective in improving their presentation skills and comfort levels and would strongly recommend it to others. Twelve of 14 invitees signed up for this non-mandatory opportunity, and we believe that speaks to the desire faculty have to obtain feedback on their teaching skills, particularly junior faculty who are often thrust into prominent teaching situations without having had adequate training. Future plans include validation of the presentation evaluation tool and online dissemination of the coaching program.

A CURRICULUM TO IMPROVE RESIDENT KNOWLEDGE AND SATISFACTION IN CARING FOR HOSPITALIZED PATIENTS WITH ADDICTION - UPDATE Payel J. Roy[2]; Zoe M. Weinstein[1]; Kristen DiBlasi[2]; Shruti Shantharam[2]; David Yuh[1]; Linda Neville[1]; Alexander Y. Walley[2]. [1]Boston Medical Center, Boston, MA; [2]Boston Univ, Boston, MA. (Control ID #2707436)

NEEDS AND OBJECTIVES: We previously described a new curriculum to improve knowledge and satisfaction among internal medicine (IM) residents who care for patients with substance use disorders (SUD) and addiction; this abstract seeks to provide an update regarding the evaluation of the curriculum's efficacy. Residents frequently care for patients with SUD but are significantly less likely to experience satisfaction in managing SUD in comparison to other medical issues. In July 2015, the Addiction Consult Service (ACS) was started, aimed at improving the care of hospitalized patients with SUD. We addressed resident discomfort by providing a curriculum as part of the ACS in order to increase their knowledge in the field of addiction and consequently their satisfaction in caring for patients with SUD.

SETTING AND PARTICIPANTS: Setting: academic safety net hospital. Primary Participants: IM residents rotating on the ACS. Secondary: IM residents who consult the service.

DESCRIPTION: The ACS functions similarly to other consulting services in IM specialties. IM residents can rotate on the service, serving as primary consultant, or they can consult the service for help in caring for inpatients with SUD. Residents have a rotation-specific curriculum developed using ACGME Core Competencies. Objectives include diagnosing SUD and understanding pharmacotherapy for alcohol and opioid use disorder. Residents who consult the ACS have increased exposure to SUD and its treatment as well, from direct communication with the ACS team.

EVALUATION: Prior to starting the ACS, we found significant dissatisfaction among our residents in caring for patients with SUD. At the end of the academic year in June 2016, we surveyed a total of 60 internal medicine residents regarding both their knowledge in addiction and their satisfaction in caring for patients with addiction. There were three groups: residents who rotated on the consult service ("rotated"; 16/60), residents who consulted the service but did not rotate ("interacted"; 37/60), and residents who had no interaction with the service ("neither"; 7/60). Our knowledge assessment consisted of 10 multiple-choice questions. Mean scores were: 79% correct for the rotated group, 64% interacted, and 51% neither. Using analysis of variance, we found that these groups were statistically significantly different from each other. We based our satisfaction survey on the Short Alcohol and Alcohol Problems Perception Questionnaire (SAAPPQ) and its analysis; our survey showed a trend towards improved satisfaction for residents based on their level of interaction with the service and we are currently fully analyzing these data.

DISCUSSION/REFLECTION/LESSONS LEARNED: The ACS provides residents the opportunity to care for patients with SUD under the guidance of experts in the field. We found that although residents experience less comfort and satisfaction in managing patients with SUD, we can improve this by using targeted curricula to increase their knowledge regarding addiction, and consequently, their satisfaction in caring for these patients.

A FLEXIBLE, MULTI-MODAL SHARED DECISION MAKING TRAINING IN FOR RESIDENTS Lewena Maher[3]; Kathleen Fairfield[2]; Paul Han[2, 1]; Leo B. Waterston[2, 1]; Kristen A. Sciacca[1]; Sean Lena[1]. [1]MMC, Portland, ME; [2]Maine Medical Center, Portland, ME; [3]Maine Medical Center Research Institute, Portland, ME. (Control ID #2700472)

NEEDS AND OBJECTIVES: Shared decision making (SDM) training for residents is an important but unmet need. The objective of this study was to develop and test the feasibility, acceptability, and initial outcomes of different SDM training strategies

SETTING AND PARTICIPANTS: Internal Medicine, Family Medicine, Urology, and OB/GYN residents at an urban teaching hospital.

DESCRIPTION: We developed a flexible multi-modal training program consisting of several components: 1) in-person didactic training (consisting of a 1-hr lecture), 2) online didactic training (consisting of a 1-hr e-learn module), 3) observed structured clinical examination (OSCE) training using standardized patients (SPs), and 4) point-of-care coaching and evaluation. All four residency programs implemented either the in-person or online didactic training. The Internal Medicine, Family Medicine, and Urology programs additionally implemented OSCE training, while the OB/GYN program implemented point-of-care coaching and evaluation; these training experiences utilized clinical cases selected by each program.

EVALUATION: Two programs (Urology and OB/GYN) elected to implement the e-learn module as a group didactic experience. The other two programs (Internal Medicine and Family Medicine) implemented the e-learn independently, and a total of 12/18 eligible residents completed the module. Pre-post assessment of these residents' subjective competence in SDM skills showed improvement in the proportion of residents indicating high confidence in: 1) their understanding of SDM (42% pre-module vs. 75% post-module, $p = .05$), and 2) their ability to engage patients in SDM (33% pre-module vs. 58% post-module, $p = .05$). However, residents gave qualitative feedback that the e-learn module was difficult to navigate and of modest educational value. PGY3 Internal Medicine and Family Medicine residents ($N = 22$) completed the OSCE. Pre-post evaluations showed improvement in the proportion of residents indicating high confidence in: 1) eliciting the patient's values and

preferences (5% pre-OSCE vs. 39% post-OSCE, p 0.0009) and 2) discussing pros and cons of treatment with patients (14% pre-OSCE vs. 48% post-OSCE, $p = 0.0001$) Implementation of point-of-care coaching and evaluation of SDM in the OB/GYN program was not successful. The selected clinical scenario—vaginal birth after Cesarean—did not occur as frequently as anticipated; residents and faculty had difficulty identifying these patients prior to or at the time of the visit, resulting in missed opportunities to evaluate residents' SDM skills.

DISCUSSION/REFLECTION/LESSONS LEARNED: Didactic training in SDM is feasible and potentially effective in increasing residents' subjective competence in SDM, but elearn training may have limited acceptability to residents. OSCE-based experiential training appears to be acceptable and effective, but may be less feasible depending on program resources. Point-of-care coaching and evaluation may also have limited feasibility. Further research in this area is needed develop and evaluate alternative strategies to train residents in SDM.

A LONGITUDINAL CURRICULUM IN ELECTROCARDIOGRAM INTERPRETATION FOR THIRD YEAR MEDICAL STUDENTS Adrienne W. Mann[1, 2]; Alexis Z. Tumolo[1]; Christopher King[1]. [1]University of Colorado, Denver, CO; [2]Denver VA Medical Center, Denver, CO. (Control ID #2707033)

NEEDS AND OBJECTIVES: The electrocardiogram (ECG) is a commonly used diagnostic test. ECG interpretation skills are generally taught during the 3rd year Internal Medicine clerkship. At our institution, this was done in a non-standardized lecture-based format without assessment of learner's knowledge, skills, or confidence. This educational innovation aimed to develop the knowledge, skills, and attitudes necessary to systematically analyze, interpret, and communicate key findings of ECGs among 3rd year medical students by delivering a curriculum covering all ECG diagnoses in the Clerkship Directors in Internal Medicine (CDIM) learning objectives.

SETTING AND PARTICIPANTS: The course was delivered to third year medical students on the 8-week Hospitalized Adult Care (HAC) Clerkship.

DESCRIPTION: Six flipped-classroom sessions were delivered across the 8-week HAC Clerkship in 3 consecutive blocks. Before each session, learners reviewed materials covering a topic in ECG interpretation. During the sessions, they worked in small groups applying skills they learned to the interpretation of 5 tracings, reporting their findings to the larger group. A Chief Resident provided feedback and facilitated discussion of key findings. Learners completed a pre- and post-assessment using a previously validated tool, and reported confidence in several tasks.

EVALUATION: 62 students have completed the curriculum. There was statistically significant improvement on on each of the 17 questions of the knowledge assessment (p-value ranging from 0.02 to <0.0001). Mean performance improved from 45% to 88% ($p < 0.0001$) with mean increase of 5.8 correct answers. Over 90% of learners correctly identified Atrial Fibrillation, Right Bundle Branch Block, 1st Degree Atrio-ventricular Block, Atrial Flutter, Hyperkalemia and Premature Ventricular Complexes, with 98% correctly identifying ST-elevation Myocardial infarction on the post-test. Students responded to 9 questions assessing confidence in various components in ECG interpretation on a 4-point Likert scale (potential for maximum of 36 cumulative points). Pre-scores ranged from 3–30, and post scores ranged from 18–35 with mean improvement in overall score of 10.9 points ($p < 0.0001$)

DISCUSSION/REFLECTION/LESSONS LEARNED: Implementation of an ECG curriculum in HAC clerkship resulted in statistically significant improvement in identification of important findings and confidence in ECG interpretation among 3rd year medical students. Verbal feedback from the students was positive, but students requested revision of the dense and lengthy preparatory materials, and more in-depth annotated discussion of each tracing covered in the sessions, which have now been revised. Evaluation of student performance with the updated format is ongoing.

A MULTIFACETED APPROACH TO IMPROVE RESIDENT OUTPATIENT PANEL MANAGEMENT Patrick J. Sayre; Kathryn Anderson; Robin E. Canada; Marc Shalaby. University of Pennsylvania, Philadelphia, PA. (Control ID #2703441)

NEEDS AND OBJECTIVES: Residents in our program identified outpatient panel management as an area of need for increased instruction. We conducted a survey of interns and residents in our program that included questions directed across a variety of topics related to panel management. Informed by our survey findings, we developed a module for the resident curriculum with the following objectives. At the conclusion of the module, residents should be able to 1) utilize a standard system for ensuring the resolution of outstanding patient care issues, 2) formulate and enact action plans when high risk or complex patients do not show for appointments, and 3) participate in formal handoffs for outpatients with active issues when transitioning on or off of outpatient rotations.

SETTING AND PARTICIPANTS: Our curriculum was designed for interns and residents at an outpatient general internal medicine practice associated with a university-affiliated primary care residency program.

DESCRIPTION: We developed a set of tools to improve resident outpatient panel management. The first component is an importable "smart-text" statement for electronic clinic notes. It includes mandatory editable text that serves as a forcing function to prompt residents to identify any critical tasks or issues that require active surveillance. The second component is an electronic spreadsheet stored on a shared, secure drive. Each resident maintains their own spreadsheet, which records patients with outstanding tasks or issues, along with a management plan and due date. Residents routinely review and update their spreadsheet to ensure completion of all outstanding tasks. The third component is a standard handoff tool that residents use to sign out to their clinic partner when transitioning on or off of their outpatient rotations. Finally, we developed a didactic session to instruct residents in the use of these tools.

EVALUATION: This curriculum is in progress and will be delivered for the first time in early spring 2017. The planned evaluation will include early and late post-module surveys as well as course director review of importable smart-text utilization and spreadsheet upkeep.

DISCUSSION/REFLECTION/LESSONS LEARNED: Active surveillance to ensure resolution of critical patient care issues and effective communication with colleagues regarding complex patients are essential skills for successful outpatient panel management after graduation from residency. It is necessary for residents to build a solid foundation in these skills during their training.

A MULTIMODALITY MUSCULOSKELETAL CURRICULUM FOR INTERNAL MEDICINE RESIDENTS Ami DeWaters; Una E. Makris; Andres Quiceno; Lynne Kirk. UT Southwestern Medical Center, Dallas, TX. (Control ID #2697978)

NEEDS AND OBJECTIVES: Knee and shoulder pain are among the most common reasons for outpatient visits in primary care, however internal medicine (IM) residents are uncomfortable diagnosing and treating these disorders. Many curricula have been proposed to address this deficiency, but have generally used one method of teaching, and have lacked simulation training and clinical experience. The objectives of this multimodal curriculum were to combine small group didactics with simulation training and clinical experience to improve IM residents' confidence, knowledge, and skill in diagnosing and treating common knee and shoulder disorders.

SETTING AND PARTICIPANTS: All 102 second and third-year residents in the UT Southwestern Internal Medicine Residency Program were studied. Half of the residents have their continuity clinic in a safety-net clinic and half of the residents in a VA clinic. The curriculum was implemented for residents in the safety net clinic with the VA clinic residents as controls. Interns were excluded due to scheduling conflicts.

DESCRIPTION: In August 2016, the 51 intervention residents began the multimodal curriculum comprised of 4, hour long, small group sessions embedded in the residents' clinic week lectures. Sessions covered: focused history, physical exam, radiographic findings, and treatment of knee and shoulder disorders. Common knee and shoulder disorders were defined as OA, tendon/ligament injuries, bursitis, RA, and gout. There was also an hour long simulation training session on performing intra-articular knee and shoulder injections. Each resident was assigned at least once to a dedicated knee and shoulder clinic operated weekly in the safety-net clinic. Prior to the curriculum, both the intervention and control groups of residents ($n = 102$) were asked in-person to complete a validated musculoskeletal skills confidence survey and a validated written musculoskeletal knowledge exam (passing score 70%).

EVALUATION: The response rate was 51% (52 completed both). 30 respondents were intervention residents. At baseline, the confidence survey (based on a 5 point Likert scale) revealed only 12% of all residents felt somewhat or very comfortable performing a knee/shoulder exam. 10% of residents were somewhat comfortable treating musculoskeletal disorders; none felt very comfortable with treatment. Only 1 resident passed the knowledge exam; scores ranged from 24-71% (average score, 47%). In March 2017, all 102 residents will be asked to complete the follow-up confidence survey, the written exam, and also an objective structured clinical examination of a knee or shoulder disorder, and differences between the intervention and control groups will be assessed.

DISCUSSION/REFLECTION/LESSONS LEARNED: IM residents continue to feel ill-equipped to examine and treat common knee and shoulder disorders, and exhibit poor musculoskeletal knowledge. Our intervention aims to significantly increase confidence, knowledge and skills of IM residents in diagnosing and treating common knee and shoulder disorders.

A NOVEL CURRICULUM FOR HOSPITALIST FACULTY IN PROVIDING CARE TO GERIATRIC HIP FRACTURE PATIENTS

Aditi Puri[2]; Rollin Wright[3]; Melissa McNeil[3]; William Levin[1]. [1]University of Pittsburgh Medical Center, Gibsonia, PA; [2]University of Pittsburgh Medical Center, Pittsbrugh, PA; [3]University of Pittsburgh Medical Center, Pittsburgh, PA. (Control ID #2692646)

NEEDS AND OBJECTIVES: According to the CDC, at least 300,000 people older than 65 are hospitalized for hip fractures annually. Society of Hospital Medicine recognizes geriatric care as one of the core competencies, and hospitalists frequently provide care to geriatric hip fracture patients. Clearly physicians need to be compenent i proviing care to such patients.

SETTING AND PARTICIPANTS: Our goal was to design an effective online module for the hospitalist faculty and geriatric fellows that covered basic principles of care in geriatric hip fracture patients at academic medical setting.

DESCRIPTION: With the expertise of a geriatrician, we designed an interactive case-based online educational module, delivered through a virtual patient software available at our institution. The case started with a patient presenting with a hip fracture and went through various common medical problems during hospitalization before post-operative discharge. We focused on recent evidence about mortality associated with hip fractures, guidelines about pain control, guidelines about deep venous thrombosis prophylaxis, guidelines about delirium management, recent evidence about nutrition, KATZ ADL scale and Clinical Frailty Scale.

EVALUATION: Evaluation of the curriculum consisted of pre and post-test surveys delivered through REDCAP software immediately after the module and at 30-60-day point. The surveys assessed knowledge and comfort levels based on questions designed by the authors. We used the Wilcoxon Sign rank test to analyze significant increase in comfort level and knowledge scores. Participants were asked to rank the helpfulness of the module based on a 5-point Likert scale. The curriculum was delivered to 52 participants and we had a response rate of 63.5% ($N = 33$) in the immediate post-module survey. Participants reported a significantly improved comfort level with regard to understanding surgical outcomes, using functional scales for prognosis, evidence about mortality related to hip fractures, factors that increase risk of delirium, delirium treatment. There was a significant increase in knowledge base noted ($p = 0.001$). On average participants ranked the helpfulness as 4.54 on the Likert Scale. We had 55.8% ($N = 29$) respondents for the 30-60-day survey. Compared to the pre-module survey, participants continued to report an increased comfort level in using functional scales for prognosis, evidence about mortality related to hip fractures, factors that increase risk of delirium, delirium treatment. Once again, there was also a significant increase in knowledge compared to pre-module survey ($p = 0.0006$).

DISCUSSION/REFLECTION/LESSONS LEARNED: Our module led to an increase in comfort and knowledge of participants, with evidence of knowledge retention in our 30-60-day survey. Thus, this convenient, electronic module design was an effective and educational tool for the hospitalist faculty, and may be used for many educational topics for busy clinicians. Further evaluation of the curriculum will measure sustained knowledge base and changes in provider behavior.

A NOVEL OSCE CASE TO ASSESS MEDICAL STUDENTS' UNNECESSARY TEST UTILIZATION AND COMMUNICATION SKILLS

Sandra K. Oza[1]; Pablo Joo[1]; Felise Milan[2]. [1]Montefiore Medical Center/ Albert Einstein College of Medicine, Bronx, NY; [2]albert einstein college of medicine, Bronx, NY, NY. (Control ID #2703833)

NEEDS AND OBJECTIVES: Concerns about health care costs and potential risks of medical interventions have prompted efforts to decrease utilization of those with low likelihood of benefit (i.e. Choosing Wisely[1]). Medical educators must train learners to consider value in their care of patients, and to communicate with patients about both value and risk, particularly when

patients request low value tests or treatments. Novel assessments are needed to determine whether learners achieve these competencies. This innovation aims to evaluate a new observed, structured clinical examination (OSCE) case to assess medical students' value-based care and communication skills. [1] http://www.choosingwisely.org

SETTING AND PARTICIPANTS: This innovation took place at the Albert Einstein College of Medicine in Bronx, NY. One-hundred seventy-eight third year medical students participated in this OSCE case as part of an 8 case clinical skills assessment.

DESCRIPTION: In the OSCE case, students evaluated a standardized patient (SP) with acute low back pain who requests an MRI, which is not clinically indicated.[2] SPs used checklists to assess students' history (11 items), physical examination (9 items) and communication skills (with a previously validated tool adapted to measure Choosing Wisely communication skills, 14 items). SPs assessed whether a student had referenced medical guidelines (yes/no) and informed them of any risks to unnecessary medical testing (yes/no) in their response to the MRI request. Students completed a post-encounter exercise in which they were asked about their response to the patient's request for MRI. [2]Chou R et al. Lancet 2009; 373:463–72.

EVALUATION: Mean performance on the case was 62.2% (SD 12.2%, range 40–92%). Forty-two students (24%) indicated they would order an MRI. A minority of students referenced clinical practice recommendations or informed the SP about risks of unnecessary testing (79/44 and 60/34%, respectively). The reliability of this OSCE case, using the borderline regression method,[3,4] was good ($R^2 = 0.65$). Future analyses will include: (1) assessing the correlation between history and physical examination checklist scores and ordering an MRI; (2) analyzing students' clinical reasoning regarding ordering an MRI (as documented in the post-encounter note), and (3) analyzing transcripts of students' communication with the SP in response to the request for an MRI. [3]Homer M and Pell G. Med Teach 2009; 31:420–5. [4] Hejri SM et al. J Res Med Sci 2013; 18:887–91.

DISCUSSION/REFLECTION/LESSONS LEARNED: We used an established method of performance-based assessment (OSCE) to assess student competency in value-based care. Preliminary analyses indicate while most students adhered to clinical practice recommendations, most failed to educate the patient about the evidence informing the decision, and risks of harm. Our findings can inform future curriculum development aimed at training learners both to consider value and communicate about value with patients.

A NOVEL SYSTEMS-BASED PRACTICE CURRICULUM ENABLES PRE-CLINICAL STUDENTS TO LEARN AND CONTRIBUTE MEANINGFULLY TO SYSTEMS IMPROVEMENT Lynnea Mills; Marwa Shoeb; Ari Hoffman; Steven Ludwin; Adeena Khan; Cindy Lai. UCSF, San Francisco, CA. (Control ID #2702847)

NEEDS AND OBJECTIVES: Systems-based practice (SBP) is critical to physicians' work and is gaining emphasis in medical school curricula. In this pilot curriculum for first-year medical students, we developed a novel didactic and experiential approach to teaching SBP skills, seeking to help students apply newly-acquired SBP concepts to inpatient improvement projects to add value to the clinical environment.

SETTING AND PARTICIPANTS: 12 first-year medical students assigned to our Hospital Medicine site for their clinical preceptorship

DESCRIPTION: We developed a 17-session curriculum to teach traditional clinical skills alongside novel SBP concepts. We presented didactics and workshops around QI terminology and methods, healthcare costs/value, health IT, and patient experience. Sessions were developed and facilitated by junior faculty with SBP interests, and emphasized real-world examples of translating SBP skills into improved quality of care. Students used their growing QI skillset to contribute to four improvement projects: reducing unnecessary phlebotomy, improving patients' sleep, improving the EMR's interface with primary teams, and humanizing patients through personal photos at bedside.

EVALUATION: We surveyed students on knowledge and skills learned after each session, as well as globally at the end of the curriculum. Response rate was 100 and revealed that students felt they could define QI terms (mean 4.2 on 1–5 Likert scale of "strongly disagree" to "strongly agree"), develop goals for QI projects (mean 4), and describe factors driving healthcare costs (mean 3.8). Students felt the curriculum was relevant to their professional development (mean 4.3) and that they would apply the learned SBP concepts and skills to their future work (mean 4). Content analysis revealed that students particularly valued SBP experiences that involved direct patient interactions, and further showed that students engaged in critical thinking related to effects of SBP on authentic clinical practice, controversies surrounding SBP issues, and consequences of current approaches to SBP. Faculty analysis of project outcomes demonstrated a significant positive impact of the students' work on QI outcomes.

DISCUSSION/REFLECTION/LESSONS LEARNED: Our results show that curricula integrating clinical and SBP learning can effectively teach pre-clinical students the basic concepts and skills of SBP. Furthermore, students' feedback indicates that the ability to tie SBP content into clinical skills and contextualize it with real patients may even be necessary for maximum learning and retention of SBP for learners with minimal prior clinical experience. Even without significant clinical experience, however, students were able to use this fairly brief exposure to SBP to propel them into high-level thinking about key systems issues. Finally, dedicated SBP curricula with close faculty mentorship can empower students to contribute meaningfully to systems improvement projects in clinical settings, even at early stages of training.

A STANDARDIZED PATIENT PROGRAM QUALITY IMPROVEMENT PROJECT: USING A SP DATABASE TO UNDERSTAND OUR SP COMMUNITY, MONITOR QUALITY, AND COLLABORATE EFFECTIVELY ACROSS SP PROGRAMS Sondra Zabar[1, 1]; Lisa Altshuler[1, 1]; Adina Kalet[1, 1]; Virginia Drda[1, 3]; Meg Anderson[1, 3]; Ruth Crowe[2]; Alexandra Mack[1]; Colleen Gillespie[1, 1]. [1]NYU School of Medicine, New York, NY; [2]NYU School of Mediicne, New York, NY; [3]NY Simulation Center, New York, NY. (Control ID #2705498)

NEEDS AND OBJECTIVES: Standardized Patients (SPs) are integral to health care professions (HCPs) training. We must understand this workforce, make effective use of SPs' skills, and ensure they accurately portray cases and rate learners. To be authentic, simulation should reflect the demographics of the population served, while providing exposure to less commonly seen patients. We created an SP database to facilitate our work with SPs; review their demographic characteristics; and align information on SP performance -to better serve our educational mission.

SETTING AND PARTICIPANTS: NYSIM (Simulation Center for NYU Langone and the City University of NY) serves hundreds of HCP training

programs for learners at all levels. While sharing common resources, many programs independently recruit and train SPs.

DESCRIPTION: We fielded a web-based survey for SPs and staff to populate the database. Survey items were iteratively reviewed by staff and SPs to ensure items elicited key information. Questions included basic demographics; SP experience/training; other professional background; and relevant physical findings (eg scars, cardiac findings). SPs also uploaded a headshot and resume. Staff separately input information about SPs' work on cases and programs; information about case portrayals; types of cases for which the SP is best suited, and other relevant information.

EVALUATION: To date, we have 232 SP surveys, representing the majority of SPs at NYSIM. Demographics included gender (43% male, 56% female, 1% transgender), age range (x = 34.9 years, range teen to 75+) and self-identified race (71% Caucasian, 17% African-American, 25.6% Asian/South Asian, 3.5% Middle Eastern, 3% Native American/Pacific Islander and 9% other). 22% are bilingual, with over 20 languages represented. SPs had a broad range of SP experience (x = 2.8 years, S.D. = 1.8, range 0–20 years). Almost all SPs were trained in basic case portrayal, with others being trained in aspects of the physical exam, emotional issues, giving feedback, and high stakes rating. SPs bring other skills to their work, including teaching (75%) or healthcare (12%). Survey information helps educators recruit SPs and identify (re)training needs. SPs who perform high stakes exams or are Unannounced Standardized Patients are shielded from general recruitment in order to maintain their anonymity.

DISCUSSION/REFLECTION/LESSONS LEARNED: An SP database is useful for a high volume simulation center. Information in a searchable SP data base allows programs to understand the potential pool and expertise of SPs, and to track learners' exposure to specific SPs (this is relevant as our internal data reveal that SPs with more experience tend rate towards the middle of the scale). The demographic characteristics of our SPs broadly match the profile of our healthcare systems, and tracking the data allows us to maintain a good fit between SPs and our environment.

A TARGETED 1-YEAR RESEARCH CURRICULUM Elizabeth Cerceo. Cooper University Hospital, Cherry Hill, NJ. (Control ID #2706701)

NEEDS AND OBJECTIVES: The Accreditation Council for Graduate Medical Education (ACGME) recommend that faculty should encourage and support residents in scholarly activities. However, many programs struggle to augment the residents' research output. We sought to develop a robust and sustainable longitudinal curriculum, providing the formal mentoring infrastructure along with foundational instruction for practically conducting research.

SETTING AND PARTICIPANTS: Second-year internal medicine residents

DESCRIPTION: The curriculum was created as a two-pronged approach to 1) increase the practical knowledge and skills to conduct research and 2) pair residents with dedicated research facilitators. The first part of the approach was to provide a series of lectures to solidify the residents' research foundation.The second key part of the initiative was to engage a small number of faculty identified for their interest in research and to pair them with a small group of 3–4 residents.The facilitator *may* also be the content expert in the resident's area of interest but this was not a requirement. If residents had interest in another area, the facilitators would help find a content expert to work alongside the facilitator. However, it was the facilitator's job to move the research goals forward, whether the research is done primarily with that mentor or with a second research mentor. Seven evening workshops were scheduled throughout the year. Mentors would meet or email their small group regularly to keep them on the planned timeline. Additional funding was secured to augment the time spent by the faculty. The lectures were designed to match the evening workshops with the themes and content, supporting the active work in the evening. Each evening workshop started with goal-setting, after which the facilitator guided the residents' clinical questions. The workshops, however, provided a clear timeline for completion of each step of the research process.

EVALUATION: Faculty evaluate each resident biannually based on attendance, participation, quality of contribution, and quality of deliverables for each session. The assessment tool is mapped to the Milestones. The residents also evaluate their facilitators and the efficacy of the program as a whole.

DISCUSSION/REFLECTION/LESSONS LEARNED: The structure and timeline of this curriculum contributed to accountability. We realized much more time had to be devoted to developing the clinical question. After constructive feedback, more realistic projects (smaller scale, more retrospective) were pursued. While much of the work was conducted in these scheduled workshops, a good deal of additional time was required to complete the necessary tasks at each step.

ALIGNING RESIDENT AND MEDICAL STUDENT TEACHING PROGRAMS: ASSESSMENT OF A NOVEL TRAINING APPROACH FOR FUTURE PHYSICIAN EDUCATORS Toshiko Uchida; Robyn Bockrath; Katherine Wright; Clare Petrie; John X. Thomas; Elizabeth R. Ryan. Northwestern University Feinberg School of Medicine, Chicago, IL. (Control ID #2701078)

NEEDS AND OBJECTIVES: Peer teachers have similar student outcomes when compared to faculty teachers,[1] but there are limited opportunities for providing students with feedback on their teaching. The objective of this project was to evaluate the quality of the narrative feedback that residents provide for senior (M4) students' teaching.

SETTING AND PARTICIPANTS: At Northwestern University Feinberg School of Medicine all M4 students are required to teach junior students and M4s receive feedback on their teaching from volunteer residents. In this novel alignment of teaching programs along the medical education continuum all M4s and residents participate in a teacher-training program. This analysis includes written feedback to M4s and participant satisfaction survey data from 2011–2016.

DESCRIPTION: A convergent parallel mixed methods approach was used based on a previously established operational definition of feedback in clinical education.[2] The quality of resident feedback provided to M4 students ($n = 445$) was analyzed by two independent raters and discrepancies were resolved by a panel of experts. Quality of feedback was coded on a 4-point scale: providing weak feedback (0), making a specific observation (1), identifying a performance gap (2) or stating an actionable item for improvement (3). Feedback was further qualitatively analyzed for the presence of themes formally taught in the teacher-training program: setting expectations, self-assessment and learner engagement.

EVALUATION: The overall mean quality rating of feedback was 2.72 (scale 0–3). Of the 445 feedback narratives, 1.8% provided weak feedback, 10.1% made a specific observation, 2.2% identified a performance gap and 85.8% stated an actionable item for improvement. For all resident subspecialties and years of involvement, over 81% of feedback achieved the highest

quality rating (3). The following themes were present in the feedback narratives: setting expectations (31.7%), self assessment (34.2%) and learner engagement (56.4%). Overall, M4 and resident satisfaction with the teaching program ranged from 4.7-5.2 (1 = extremely dissatisfied, 6 = extremely satisfied).

DISCUSSION/REFLECTION/LESSONS LEARNED: This analysis found that residents are providing high quality written feedback on M4 teaching regardless of the year of participation or specialty. Both residents and M4s report high satisfaction with the program. The higher prevalence of learner engagement noted in feedback may reflect the emphasis placed on engagement during the formal training provided to residents. REFERENCES:

AN INNOVATIVE APPROACH TO TEACHING ASYLUM MEDICINE AND PROMOTE RESILIENCE IN TRAINEES WHO EVALUATE TORTURE SURVIVORS: THE OBSERVERSHIP MODEL IN A SIMULATION CENTER
Katherine C. McKenzie[1]; Arielle Thomas[2]; Kimberly Ono Ayala[1]. [1]Yale School of Medicine, New Haven, CT; [2]University of North Carolina, Chapel Hill, NC. (Control ID #2695128)

NEEDS AND OBJECTIVES: In 2015, 65 million individuals worldwide were displaced from their homes due to persecution and more than 172,000 individuals applied for asylum in the US. A medical forensic evaluation of asylum seekers can increase the likelihood of a successful asylum case. With this innovative model, we sought to meet the high demand of trainees interested in asylum evaluations and model coping mechanisms to promote resilience in this difficult field..

SETTING AND PARTICIPANTS: Up to 8 medical trainees observe asylum evaluations behind a one-way mirror in a Simulation Center ("Sim Center"), with access to technologically-advanced equipment allowing them to view the exams with ease.

DESCRIPTION: Trainees review asylum medicine course material and the applicant's affidavit and are queried about vicarious trauma with a supervising physician before and after the evaluation. Supervising physicians model self-care behaviors and coping mechanisms. Over the last 3 months 21 trainees have received a post-observership survey with Likert-type and narrative questions.

EVALUATION: 71% trainees responded; 79% were under age 25. 63% were female, 16% were foreign-born, and none of the participants were past asylum seekers or refugees. Almost 38% have had some experience working with refugee or immigrant populations. All respondents felt that it was a worthwhile experience and would recommend the learning opportunity to a colleague. Being in the simulation center itself was conducive to the learning experience for all of the participants but 84% felt that being in the room would have been more helpful. Eighty-five percent of participants denied vicarious trauma and 100% felt that they received adequate emotional support during their experience. Finally, 89% of participants were interested in participating in another evaluation. Narrative responses include: "I enjoyed the observership, as it was good to see in person how asylum evaluations are performed, what types of clinical signs to look for, how to engage with a refugee, etc." "Even though we're not providing care, I wouldn't have realized otherwise how emotionally significant it would be to provide a medical evaluation." "…However, I'm not sure I would have much to gain from a second observership."

DISCUSSION/REFLECTION/LESSONS LEARNED: Some medical schools receive large numbers of referrals for medical evaluations of asylum seekers and have ample faculty support. For other institutions, the demand by trainees for an introduction to the field outstrips referrals and the availability of faculty mentors. Additionally, some trainees desire an episodic, brief introduction. This ongoing study was highly rated by participants who felt the Sim Center was conducive to learning, although many would prefer a more interactive experience. Observerships are ideal for institutions where referral volume and faculty mentorship are limited: they offer the best opportunity for the greatest number of interested trainees.

AN INNOVATIVE APPROACH TO TEACHING RESIDENTS HOW TO ADDRESS HEALTH CARE INEQUITIES
Ashley N. Tran; Gayatri Patel; Jennifer Siegel. Boston Medical Center, Boston, MA. (Control ID #2706867)

NEEDS AND OBJECTIVES: Efforts to address health care inequities at the physician level have traditionally focused on improving a provider's cultural competency. While these interventions address cultural and linguistic barriers between patients and providers, they do not always highlight the institutional and socioeconomic factors outside of the clinical encounter that deeply impact health and well being. Further, these efforts are not always based on the actual concerns of the communities served. There is a need for more innovative approaches to integrate social determinants of health curricula that are accountable to community needs into internal medicine residency programs. The objective was to improve resident physicians' knowledge of the social determinants of health and awareness of community resources that can positively impact patient health.

SETTING AND PARTICIPANTS: The participants were first-year residents in the internal medicine training program at a large, urban academic medical center.

DESCRIPTION: We developed a half-day curriculum which included a brief didactic lecture providing an overview of social determinants of health followed by a more experiential learning approach. The residents were taken on a guided walking tour of the neighborhood surrounding Boston Medical Center. Residents visited various community sites including a homeless shelter, medical respite facility, substance use treatment center, and hospital food pantry. Leaders in community health at these sites also had the opportunity to share their experiences with patient advocacy.

EVALUATION: A survey was completed by 20 residents three months post intervention. It assessed the quality and impact of the new curriculum on their existing clinical practice.

DISCUSSION/REFLECTION/LESSONS LEARNED: Overall, feedback from participants was overwhelmingly positive. Fifty percent of residents stated that the session moderately improved their knowledge of the social determinants of health. In addition, sixty percent of residents stated that the tour increased awareness of local resources by a great extent. These changes were also reflected in a self-reported increase in the number of resident referrals to the food pantry, inpatient and outpatient substance use services, and better

coordination of care when discharging patients to homeless shelters. Residents also had a better understanding of community health, and the majority felt better equipped in utilizing external resources for patient care.

AN INNOVATIVE CURRICULUM FOR TEACHING TUTORING SKILLS TO FOURTH YEAR MEDICAL STUDENTS: VIDEO MODULES, STANDARDIZED TUTEES, AND SELF-DESIGNED LESSON PLANS Marjorie E. Bateman[4]; Robert B. Jones[4]; Erik Green[4]; Mira John[4]; Bradford Hilson[4]; Jordan Wlodarczyk[4]; Norman Kreisman[3]; Catherine Jones[2]; Chayan chakraborti[1]. [1]Tulane, New Orleans, LA; [2]Tulane University SOM, New Orleans, LA; [3]Tulane University School of Medicine, Mandeville, LA; [4]Tulane University School of Medicine, New Orleans, LA. (Control ID #2705894)

NEEDS AND OBJECTIVES: To increase the student-driven peer tutoring resources at Tulane, we developed the "Upperclassmen Tutoring Underclassmen in Basic sciences And Test-taking" (UpTUBAT) elective. UpTUBAT aims to increase academic support for underclassmen and to enable upperclassmen tutors to develop tutoring skills. It strives to improve the attitudes and practices of tutors and tutees with regard to peer education and learning.

SETTING AND PARTICIPANTS: We studied the Physiology (MS1 year) and Mechanisms of Disease (MS2 year) courses. Participants were divided into four groups: tutors, tutor control, tutees, and tutee control. 18 tutors and 8 tutor control members were recruited from the membership of the Alpha Omega Alpha Honor Society. Tutee and tutee control members were recruited from first and second year medical students (up to 400 students).

DESCRIPTION: We used TutorLingo (©Innovative Educators, Inc) modules, standardized tutee experiences, and faculty-led discussions to train upperclassmen in tutoring. TutorLingo is a commercially-available training portal featuring video modules. After completing TutorLingo, tutors apply the lessons in 3 tutoring scenarios with standardized tutees. After receiving feedback from standardized tutees, the tutors meet with a faculty member to discuss the scenarios and strategies for addressing challenging tutoring situations. The tutors then design and host two-hour tutoring sessions. The structure models the tutoring cycle, including an agenda, review of concepts, testing of understanding, summary of take-home points, and time for questions.

EVALUATION: Pre- and post-tutoring surveys assess the attitudes and practices of the tutors and tutees on tutoring and learning the material. Pre-tutoring surveys for tutees also include educational background information which examines factors associated with seeking tutoring. We measured the effects on tutee grades by collecting the average score and the number of failing students for each exam, divided into those receiving or not receiving tutoring for each exam. Statistical analyses will evaluate changes in tutor attitudes and practices, tutee attitudes and practices, and tutee grades using t-test and chi-squared for univariate analyses and ANOVA for other analyses.

DISCUSSION/REFLECTION/LESSONS LEARNED: UpTUBAT is one of the first student-generated peer-tutoring electives in the medical school setting. Another unique aspect is the standardized tutee training session. Our standardized tutee sessions train tutors to lead large group tutorials in the basic sciences. While standardized patient sessions are well-validated for improving clinical skills, they have primarily been used to teach responses to clinical scenarios, not to teach tutoring. Tutors appreciate the opportunity to practice TutorLingo lessons in standardized tutoring scenarios. Over the semester, tutors hosted an average of 35 tutees per weekly session. Tutees have become more comfortable engaging with the material and with each other.

AN INNOVATIVE INPATIENT SAFETY CURRICULUM FOR RESIDENTS John Szymusiak1, 1; Catherine Polak[1]; Kwonho Jeong[3]; Doris M. Rubio[1, 3]; Stephanie B. Dewar[1]; Andrew Urbach[1]; Michael D. Fox[2]; Alda Maria Gonzaga[1]. [1]University of Pittsburgh School of Medicine, Pittsburgh, PA; [2]Nemours Alfred I. duPont Hospital for Children, Wilmington, DE; [3]University of Pittsburgh, Pittsburgh, PA. (Control ID #2690956)

NEEDS AND OBJECTIVES: Patient safety is an important part of resident education. A local needs assessment of pediatric residents showed that >93% of residents agreed safety was important for their education and practice. Only 13% felt comfortable using root cause analysis (RCA) and 48% felt prepared to apply safety principles to a future career. We aim to increase residents' comfort applying safety principles, satisfaction with their safety education, knowledge of safety, and event reporting rates.

SETTING AND PARTICIPANTS: The curriculum was delivered to PGY-2 and above pediatric, internal medicine-pediatric, and triple board residents at the Children's Hospital of Pittsburgh during a monthly, 1-hour long morning report session.

DESCRIPTION: Content covered system-based thinking, terminology, 2nd victim phenomenon, RCA, and medication errors. The multidisciplinary sessions included 20 min of didactic with the remaining time for group discussion or activities. The final 5 min of the sessions reviewed an event report that led to a system-level change to provide feedback to residents and illustrate reporting efficacy.

EVALUATION: Eligible residents were surveyed before and after the 5-month curriculum. Attitudes were assessed with a 5-point Likert scale and free response questions, knowledge with a 20-question multiple choice test, and reporting behaviors by self-report. Residents with pre- and post-data were analyzed using the Wilcoxon matched-pairs signed-ranks test. Fisher's exact test was used to see if attendees had improved attitudes and knowledge scores compared to non-attendees. Qualitative answers were analyzed for themes. Of 75 eligible residents, 45 (60%) completed the pre-survey and 43 (57%) completed the post-survey, with 26 (35%) doing both. Of these, 15 (58%) attended curricular sessions and 11 (42%) had not. Attendees showed significant increases ($p < .05$) in their comfort with RCA, preparedness to apply safety to future practice, and curricular satisfaction. Non-attendees showed no significant attitudinal changes. More attendees had improved knowledge of how to report and comfort with RCA than did non-attendees ($p < .05$). There were no changes in knowledge scores or event reporting. Qualitative questions identified learning about the reporting process, RCAs, and follow up on event reports as valuable parts of the curriculum. Residents desired more time to debrief about safety events.

DISCUSSION/REFLECTION/LESSONS LEARNED: Attendees showed improved attitudes and preparedness to apply safety to their future practice. This was not due to maturation as non-attendees showed no changes. Attendees did not show improved knowledge scores, possibly due to poor attendance or an overly challenging test. While attendees said they would report more in qualitative questions, they did not report filing more event reports- the reasons for this dissonance need to be explored further. Residents appreciate having a forum to vent and deal with the emotions involved in

errors. This curriculum would be easily transferable to other specialties or institutions.

AN INNOVATIVE RESIDENCY LONGITUDINAL QUALITY IMPROVEMENT CURRICULUM Shelly-Ann Fluker; Stacy Higgins. Emory University School of Medicine, Atlanta, GA. (Control ID #2706624)

NEEDS AND OBJECTIVES: The Emory Primary Care Internal Medicine Track has included team based quality improvement (QI) projects in the curriculum for over 8 years. However, teams have been structured around residents' continuity clinic, leading to large teams of both primary care and categorical residents with only a few residents accountable for project completion. In addition, projects spanned one academic year with a new project starting annually, with limited impact on patient outcomes. Our objective was to determine the feasibility of implementing a longitudinal QI project in the primary care (PC) residency track.
SETTING AND PARTICIPANTS: All PC residents participated in the curriculum. The 8 residents of each class rotate onto ambulatory blocks as a group over sequential months. Residents' continuity clinic site is Grady Memorial Hospital, Atlanta's safety net hospital.
DESCRIPTION: The PGY3 class initiated the project during their fall ambulatory block then subsequent classes worked on the project during their ambulatory blocks in the winter and spring. Each class met with the curriculum faculty mentor at the start and end of the block. At the beginning of each month, the current status of the project was reviewed and the goals for the month defined. Each block, a resident team leader was selected and teams had dedicated curricular time for working meetings. Project materials were housed on a university based online file sharing site.
EVALUATION: In year one, residents successfully selected a target, reviewed baseline data, made an aim statement, created a cause and effect diagram, and initiated a Plan-Do-Study-Act cycle. Specifically, residents chose to focus on improving diabetes control in patients with HbA1c > 10. After creating the cause and effect diagram, residents created a 16 item patient survey to determine which of the patient factors they identified played the most important role in their patient population. The survey was distributed to 150 patients over a 3-month period and results are being used to inform a test of change. Residents successfully handed off the project from one ambulatory block group to the next and completed the project goals for each month. The project has continued in the 2nd year of the curriculum incorporating retained residents and new interns.
DISCUSSION/REFLECTION/LESSONS LEARNED: A dedicated faculty mentor and resident team leader were key in ensuring that the project moved forward. Utilizing an online file sharing tool was essential for longitudinal communication between groups. Finally, providing residents with dedicated project work time during the ambulatory block led to the engagement and participation of the majority of residents in the project. Despite these successes, progress on the project was slow due to gaps between each ambulatory block. In addition, the goals for the months had to be revised based on the progress from the previous month and the new or differing ideas and input from the each subsequent group working on the project.

AN INTER-PROFESSIONAL PRIMARY CARE BASED CHRONIC PAIN MANAGEMENT AND OPIATE USE DISORDER CURRICULUM FOR INTERNS AND NEW ADVANCED PRACTITIONERS Natalie Ronshaugen; Sharon Wretzel. Baystate Medical Center, Springfield, MA. (Control ID #2703206)

NEEDS AND OBJECTIVES: Interns and new advanced practitioners (AP) often have insufficient education treating patients with chronic pain or opiate use disorder (OUD). This inter-professional curriculum improves diagnosis and treatment. Objectives *Recognize a new provider's educational needs in chronic pain management and OUD *Discover how to use institutional and community resources to help design an OUD curriculum *Learn how to design an inter-professional curriculum on OUD
SETTING AND PARTICIPANTS: Incoming interns and new AP participate in an intensive lecture series in the first three months of practice followed by intern experiences in clinic based and community organizations addressing OUD throughout the year.
DESCRIPTION: OUD is a potentially lethal disease that is often inadequately taught. In our residency program, we designed a curriculum to address this educational need. Our primary goal was to allow interns and new AP to gain a sense of mastery treating OUD and chronic pain in the outpatient setting. Our secondary goal was to model inter-professional learning. During ambulatory orientation, our interns and AP undergo a two-day intensive, inter-professional didactic lecture series from nurses and doctors on chronic pain management, opioid use and abuse, harm reduction, and buprenorphine management. Participants engage in interactive training in motivational interviewing with social workers and discussions with patients in recovery. The curriculum continues for interns throughout the year with experiences in community and clinic based buprenorphine clinics, twelve step programs, and detoxification facilities. There are also two ambulatory didactic lecture conferences during the year for all residents and AP on substance use disorders.
EVALUATION: Prior to the start of the curriculum, interns and AP had an average pretest score of 48% with a range between 25–75% correct. After the lecture series, the average score was 69% on the posttest with a range of scores between 50–88% correct. Initially, participants in the program mentioned feeling uncomfortable about opiate prescribing and chronic pain management. Participants voiced fears about opiate addiction and "failing to recognize misuse." However, participants largely found the curriculum helpful. One participant mentioned, "I feel more comfortable approaching the patient with chronic pain. (I have) more options and opiates are only one modality."
DISCUSSION/REFLECTION/LESSONS LEARNED: This curriculum improved our interns' knowledge of OUD and chronic pain management as well as how different professions impact a patient's care in OUD. Further, while the number of AP residency programs is increasing, many new AP graduates are still caring for patients with OUD with only a minimal amount of knowledge of how to do so. This curriculum can also serve as a guideline for clinics interested in improving AP knowledge of OUD. Future areas of growth for this curriculum include addressing methamphetamine use disorder; establishing a resident-run buprenorphine clinic; and improving education among clinic nurses in OUD.

AN INTERPROFESSIONAL AMBULATORY SIGNOUT: MOVING BEYOND DOCTOR-CENTERED CARE Nancy A. LaVine; Lauren Block; Daniel J. Coletti; Frank Cacace; Jennifer Verbsky; Jason Ehrlich; Johanna Martinez; Norma Roberts-Zahra. Northwell Health, New Hyde Park, NY. (Control ID #2702017)

NEEDS AND OBJECTIVES: Residency programs are moving towards block scheduling to improve the ambulatory experience. While there has been focus on improving handoffs in the inpatient setting, ambulatory signouts have centered on year-end transfers of care. Block scheduling creates a need to bridge care between rotating groups of residents. As primary care refocuses on team-based care, it is important that members of different professions are involved in the signout process. To optimize a team-based approach to primary care, ensure patient safety, and maintain continuity in the ambulatory setting, our objective was to establish an interprofessional clinic signout process.

SETTING AND PARTICIPANTS: Northwell Health's IMPACcT (Improving Patient Access, Care and cost through Training) Program is a HRSA funded 'clinic within a clinic' at our largest internal medicine residency site. Participants include faculty and learners from internal medicine, pharmacy, psychology, and physician's assistant (PA) programs. IMPACcT has a 4 + 1 schedule for residents, 4 week block for pharmacy students, 6 week block for PA students, and a once weekly schedule for the psychology extern. The clinic team is supported by a full-time medical assistant and patient coordinator. Each of these groups is represented at the weekly signout.

DESCRIPTION: We created a signout process to be completed at the end of each resident block week. The medical assistant (a continuous team member) maintains the signout process. Modeled on common inpatient practice, dedicated signout time (60 min) on Friday afternoons allows the team to discuss outstanding patient issues to be passed on to the next iteration of the care team. Interprofessional team members are assigned to follow up based on the nature of the issue (e.g. the pharmacy team will call Mr. X to ensure he was able to obtain asthma medications, the coordinator will reach out to ensure Ms. Y scheduled her follow up with her cardiologist). The signout sheet completed each week includes patient demographics, the required task, and identifies the responsible team member.

EVALUATION: To date, 26 weekly signouts have been completed; 24 included interprofessional team members (10 residents, 7 pharmacy students, 3 PA students, the medical assistant and the patient access coordinator). IMPACcT team members are being surveyed on their experiences with the signout process, with focus on utility and confidence in the signout process/ team communication. These responses will be compared to those in Northwell's traditional residency clinic, where no formal signout process exists.

DISCUSSION/REFLECTION/LESSONS LEARNED: With the move to block scheduling in residency clinics, an ambulatory signout process has become crucial for patient care. Incorporating multiple professions in an interprofessional ambulatory signout supports team based care and continuity as a means to mitigate the rotational nature of resident clinic schedules. Dedicated time to work on this process, as well as a team member devoted to maintaining the process, have been instrumental.

AN INTERVENTION TO EMBED CLERKSHIP LEARNING OBJECTIVES FOR MEDICAL STUDENTS INTO INPATIENT TEAMS AND CLARIFY TEAM MEMBER EXPECTATIONS Julien J. Dedier[1]; Sonia Ananthakrishnan, MD[2]. [1]Boston University, Boston, MA; [2]Boston University School of Medicine, Boston, MA. (Control ID #2705933)

NEEDS AND OBJECTIVES: Clerkship directors set educational goals for medical student rotations based on national and local directives shown to improve educational outcomes, and rely heavily upon attendings and residents who work with students to achieve these goals. However, attendings and residents are often unaware of key clerkship expectations for student education, and students are frustrated by these evaluators' unspoken or inconsistent expectations. Our objectives were to increase (1) knowledge and (2) achievement of our 3rd-year (M3) medicine clerkship's key educational objectives for students within ward teams; and (3) to stimulate a broader team-based discussion (TBD) of goals and mutual expectations.

SETTING AND PARTICIPANTS: We targeted inpatient medicine teams at Boston Medical Center, Boston University School of Medicine's flagship teaching hospital. Teams consisted of 1 attending, 1 resident, 2 interns and 2–3 M3 students.

DESCRIPTION: The intervention consisted of (1) a printed tool outlining the clerkship's educational goals and expectations of each team member, and (2) brief training for students and resident team leaders to use this tool. We included the tool in the course 'passport' students received at the start of the medicine rotation, and directed students to share it with the resident and attending on each team to trigger a TBD of goals/expectations. Student training occurred at the medicine clerkship orientation. Residents were training to facilitate the TBD at existing teaching sessions.

EVALUATION: We interviewed M3 students, medicine residents and medicine ward attendings to inform the intervention. We created surveys to assess the 3 objectives stated above, and prospectively assessed outcomes in all team members pre-intervention (4 teams) and during the intervention (8 different teams). We compared pre-intervention to intervention results using Chi-square and Fisher's exact tests for categorical variables, 2-sample t-tests for continuous variables, and the Wilcoxon rank sum test for Likert scale responses. In the formative phase we interviewed 14 M3 students, 11 residents and 5 attendings. In the assessment phase we surveyed 71 subjects (pre-interventio$n = 24$, interventio$n = 47$). The proportion aware of key clerkship expectations such as those governing M3 admissions, M3 electronic order entry, number of patients M3s should carry, and teaching expectations for residents and attendings was 19–41% greater on intervention vs. pre-intervention teams. On average, the likelihood these expectations were met was 14% greater on intervention teams. A TBD was more likely to occur on intervention teams (91.1% vs. 83.3%).

DISCUSSION/REFLECTION/LESSONS LEARNED: The intervention was associated with greater overall awareness and achievement of the clerkship's educational objectives for students, and with a high proportion of teams discussing goals and mutual expectations. This intervention addresses an important problem impacting the quality of medical education, and is easily adapted to any team-based rotation or set of educational objectives.

ANALYSIS OF THE EFFECT OF AN INTERPROFESSIONAL EDUCATIONAL PROGRAM ON MEDICAL STUDENT'S KNOWLEDGE AND ATTITUDES REGARDING PATIENT SAFETY AND INTERPROFESSIONAL LEARNING Yahya Ibrahim; Rebeca Kelly; Ramy Mando; Maya Dassanayake; Megan Birkhold; Mary Beth O'Connell; Diane L. Levine. Wayne State University, Detroit, MI. (Control ID #2706286)

NEEDS AND OBJECTIVES: Annually, medical errors cost $17 billion and result in 251,000 deaths. Healthcare professionals are responsible for preventing errors. Thus students need patient safety (PS) training. We developed an interprofessional (IP) PS program to educate pharmacy and medical

(med)students together to prevent, recognize, analyze, and report medical and medication errors. We report program effectiveness on med student PS attitudes, knowledge and impact of IP learning.

SETTING AND PARTICIPANTS: Third year pharmacy and med students. Workshop delivered by IM Clerkship Director and Pharmacy educator.

DESCRIPTION: 4-hour program included mini-lectures, Grey's Anatomy episode portraying a medical error, and IP group work with 1–2 pharmacy and 7–8 med students/group. Topics included overview of errors, analysis tools, just culture, human factors engineering, reporting, and PS committees.

EVALUATION: Students completed investigator-created pre-survey assessing PS knowledge and attitudes and the Healthcare Professionals Patient Safety Assessment Curriculum Survey (HPPSACS) added at midpoint of year. Students completed post surveys with additional program evaluation items. Students created a unique identifier. Only those who provided identifiers and completed both surveys were included. Likert-like questions were analyzed using Wilcoxon signed rank sums (SPSS 22). Pre/post knowledge-questions were scored analyzed with Chi square. Open-ended questions were analyzed qualitatively. Project was IRB exempt. 180 med students attended. Matched surveys were available for 136 investigator and 81 HPPSAC surveys. Pre-program nearly all students agreed that health professionals need to understand PS principles (96%), that learning to improve PS is appropriate use of curricular time (94%), and that errors causing no harm need to be reported (94%). Post-program more students believed working in an IP team improved PS (92 to 99%, $p < 0.05$). More students strongly agreed errors should be evaluated by IP committees (35 to 61%, $p = 0.003$) and non-healthcare professionals should be members of committees (19 to 51%, $p < 0.001$). Self-assessment of PS knowledge increased (30 to 94%, $p < 0.001$), as did knowledge about medical error (31 to 94%, $p < 0.001$). Students reported more comfort reporting (40 to 83%, $p < 0.001$) and analyzing errors (30 to 84%, $p < 0.001$). PS committee familiarity improved (32 to 67%, $p < 0.001$). Objective assessment of knowledge (PS terms and concepts) improved ($p < 0.001$).

DISCUSSION/REFLECTION/LESSONS LEARNED: IP education has been used to teach PS. Problems with sustainability have been described. We have been able to deliver an IP PS education to a large med school class. This workshop was initially delivered as a uniprofessional activity. Addition of a pharmacy educator enhanced the curriculum and has resulted in improved exposure to mediation errors and IP education. The workshop is fun to deliver and provides an opportunity for team teaching. We have been able to sustain by being flexible in scheduling and carving out one half day of faculty time every 2 months.

APPLYING LESSONS FROM INPATIENT MEDICINE TO THE OUTPATIENT SETTING: THE IMPROVING PATIENT ACCESS CARE AND COST THROUGH TRAINING (IMPACCT) CLINIC Lauren Block[4]; Nancy A. LaVine[3]; Daniel J. Coletti[4]; Johanna Martinez[4]; Celia Lu[4]; Alice Fornari[1]; Joseph Conigliaro[2]. [1]Hofstra NSLIJ SOM, Hempstead, NY; [2]North Shore LIJ Health System, New Hyde Park, NY; [3]Northwell Health, New Hyde Park, NY; [4]Northwell Health, Lake Success, NY. (Control ID #2702730)

NEEDS AND OBJECTIVES: Demand for primary care providers in the United States is growing as fewer trainees are entering primary care careers relative to hospital medicine and subspecialty fields. Hospital medicine has been more attractive to many trainees because of collaborative care provided by a multidisciplinary team, as well as shift work, which is facilitated by a well-developed sign-out process. We sought to build an interprofessional primary care training program based on the principle of team-based care by applying successful features of hospital medicine - service weeks, daily "rounds" and signouts - to the ambulatory setting.

SETTING AND PARTICIPANTS: Through a five-year HRSA funded program we initiated a primary care training program for internal medicine residents, medical students, physician assistant students, pharmacy students and health psychology externs at Northwell Health in July 2016.

DESCRIPTION: Our program is structured using a "4 + 1" system, in which both residents and faculty complete "on-service" weeks. Similar to the hospitalist attending model, on-service weeks allow faculty to strengthen working relationships, foster teamwork, and reinforce patient continuity. Two dedicated non-clinician team members facilitate care coordination by arranging specialty patient appointments and helping patients navigate the health system. "Rounds" occur in the form of interprofessional huddles, during which all team members discuss patient care plans and divide daily work during time set aside at the beginning of each clinical session. At the end of each week, a formal interprofessional "signout" allows all team members to review and pass along outstanding issues to the incoming team. While faculty and residents rotate "off-service" each week, continuity is provided by our patient access coordinator, medical assistant, PA student, and pharmacy student.

EVALUATION: A total of 695 patient visits occurred from July-November 2016. Faculty development sessions prior to the start of the IMPACcT clinic were held to prepare for interprofessional huddles. All IMPACcT patient visits have included the participation of at least one additional clinical team member (pharmacy, medical student, PA student, or psychology extern) to support the medical resident. Interprofessional huddles have occurred prior to each half day clinical session. Analysis of focus group data suggests that our patients recognize the value of an interprofessional approach and report receiving direct benefit from team-based care. Comparison of clinical quality indicators between IMPACCT and our traditional residency clinic show favorable performance in pneumococcal vaccination (87.5% vs. 83%), mammography (68% vs. 67%) and colorectal cancer screening (58% vs. 46%, $p < 0.01$).

DISCUSSION/REFLECTION/LESSONS LEARNED: We built a team-based primary care clinic and training program by applying successful inpatient principles of service weeks, care coordination, rounds, and signout to outpatient residency practice. Preliminary data suggests promising quality, process, and patient reported outcomes.

APPLYING QUALITY IMPROVEMENT TO JOY IN PRACTICE: A CLINIC-BASED CURRICULUM FOR TRAINEES Nicholas Meo; Evan Paul; Jeff Redinger; Milner Staub; Elizabeth Wahl; Mehraneh Khalighi; Chen Wu. VA Puget Sound Health Care System, Seattle, WA. (Control ID #2707014)

NEEDS AND OBJECTIVES: Emphasis on joy in practice has been suggested as a method to improve physician work-life satisfaction. We sought to teach the basics of quality improvement (QI) to internal medicine (IM) residents as a tool to improve joy in the workplace. We developed, implemented, and assessed a month-long curriculum to train residents to utilize QI to improve their own job satisfaction and fulfillment in practice.

SETTING AND PARTICIPANTS: Fourteen second-year IM residents ($n = 14$) participated in a primary care immersion curriculum through the University

of Washington, with QI projects implemented in three different primary care settings.

DESCRIPTION: Six faculty members with QI and medical education expertise collaborated to develop a 4-part workshop. The first session consisted of a 3-hour didactic lecture introducing QI methods and application to joy-in-practice interrupted by breakout sessions in which residents brainstormed their own projects with facilitator input. At the session's end, residents were instructed to develop a current state analysis and design an initial Plan-Do-Study-Act (PDSA) cycle around their specific joy-in-practice aim over the following three weeks. Sessions two and three were conducted as 1-hour off-site phone interviews with faculty to gauge progress and provide feedback. The final session was a 2-hour presentation, with residents showcasing their progress to faculty and fellow residents.

EVALUATION: Qualitative and quantitative evaluations were completed by 14 and 12 residents, respectively. All had prior experience with concepts and tools used in QI, but none had previously implemented a QI project. End-of-course combined ratings for quality, relevance, usefulness, and influence on future practice were 4.83, 4.92, 4.83, and 4.83, respectively, on a 5-point Likert scale. Qualitative feedback included: "I hadn't thought to improve workplace satisfaction in QI, but I loved that the course made me think about my own job satisfaction in medicine", "Great experience overall, loved that we were guided along by faculty every week", and "I will definitely change the way that I think about QI research in the future".

DISCUSSION/REFLECTION/LESSONS LEARNED: IM trainees have few self-advocacy tools. Teaching QI with the goal of improving joy in practice was perceived as novel, enjoyable, and empowering. All trainees were able to develop basic QI skills within a short timeframe, requiring minimal, periodic faculty input over the 4-week course to construct a practical and personally fulfilling improvement project. Importantly, this innovative curriculum empowers residents to advocate for their own satisfaction in the workplace and suggests a future role for incorporating joy-in-practice themes as one way to improve uptake of QI instruction.

ARE ACCELERATED 3-YEAR MD PATHWAY STUDENTS PREPARED FOR DAY ONE OF INTERNSHIP? Adina Kalet[3, 3]; Kinga L. Eliasz[3, 3]; Grace Ng[3, 3]; Demian Szyld[1, 3]; Sondra Zabar[2, 3]; Martin V. Pusic[3, 3]; Colleen C. Gillespie[3]; Lynn Buckvar-Keltz[3, 3]; Joan Cangiarella[3]; Steven B. Abramson[3]; Thomas S. Riles[3, 3]. [1]Harvard Medical School, Boston, MA; [2]NYU School of Medicine, New York, NY; [3]New York University School of Medicine, New York, NY. (Control ID #2705542)

NEEDS AND OBJECTIVES: To address rising education costs, physician shortages, and the need for educational reform, several medical schools have developed accelerated 3-year MD programs. In 2013, NYU School of Medicine began its new 3-year MD program with guaranteed acceptance into residency upon graduation. Using the AAMC's 13 Core Entrustable Professional Activities for Entry into Residency (CEPAER) framework, we designed an immersive 4-hour simulated "Night on Call" (NOC) experience to compare performance of our first graduating cohort of fifteen 3-year MD students (3A), with third (3T) and fourth year (4T) students in the traditional 4-year MD program.

SETTING AND PARTICIPANTS: 73 medical students (39 women, age 26.5 (+2.6) years; 36 '3T', 12 '3A', 25 '4T') completed an IRB-approved NOC at our simulation center 4 weeks prior to the end of their third or final year of medical school.

DESCRIPTION: We developed NOC to measure competence and entrustment across all 13 CEPAERs from the perspective of patients, nurses, and attendings. During the simulation, a medical student rotated through a series of 8 clinical coverage scenarios including: 4 standardized patient (SP) cases with varying degrees of complexity, each of which require answering a call from a standardized nurse (SN), evaluating an SP with the SN in the room, making immediate management decisions and writing a coverage note; a phone call to an experienced clinician to orally present (OP) the case; formulation of a clinical question and finding the most appropriate evidence-based medicine (EBM) answer using digital library resources; a clinical vignette (CV) to test ability to recognize a pre-entrustable peer; and a handoff (HO) of 4 cases to a peer (a senior medical student). CEPAERs assessments based on validated tools included communication, physical exam, patient education and interprofessional teamwork skills assessed by an SP and SN, and clinical reasoning based on notes, OP, EBM, CV, HO. Each rater also provided an entrustment judgment.

EVALUATION: Although overall student performance improved across cases and some interesting individual performance patterns emerged, there were no significant differences across the three groups in the core competency and entrustment measures evaluated across various NOC activities.

DISCUSSION/REFLECTION/LESSONS LEARNED: The 13 CEPAERs are meant to define what students should be expected to perform (without direct supervision) prior to entering residency. Our results, based on multiple rater perspectives, suggest that our cohort of 3A students is as prepared for residency as their 4T counterparts.

ASSESSING THE IMPACT OF A PATIENT CENTERED INTERVIEWING CURRICULUM Arash Nafisi. Olive View - UCLA Medical Center, Los Angeles, CA. (Control ID #2703970)

NEEDS AND OBJECTIVES: Trends in primary care emphasizing productivity have been associated with provider burnout, lower provider satisfaction, and correlate with decreased patient satisfaction. Data from numerous surveys assessing patient experience, including CG-CAHPS, reflect this impression. Our objective is to provide our internal medicine residents with training to enhance practical, empathy-based interviewing and communication skills in primary care, to improve the quality of patient visits without sacrificing efficiency.

SETTING AND PARTICIPANTS: Participants include all internal medicine first year categorical and preliminary housestaff. Training occurs in the ambulatory setting during protected didactic time, approximately three to four months after the start of intern year.

DESCRIPTION: Patient centered interviewing is an evidence-based method that highlights the importance of building rapport and earning patient trust, while also appreciating provider time constraints. It emphasizes provider understanding of how illness impacts the patient, noting that patients often do not seek medical care solely because of a symptom but also for its personal context. We created an evidence-based curriculum modeled after Smith's book titled *Patient-Centered Interviewing*, and based on Frankel's Four Habits Model of Communication conceptual framework. The curriculum includes a highly interactive, three-hour, small group session with video demonstration and group skills practice that highlights specific ways to enhance

communication with patients, while appreciating provider time constraints. We believe this method of interviewing not only improves patient satisfaction, but also enhances satisfaction of our internal medicine residents when caring for patients in the outpatient setting.

EVALUATION: 105 residents have thus far completed our training in patient centered communication. We evaluated the impact of this intervention via resident post-test surveys and assessed patient satisfaction through pre and post-test evaluation using a validated patient questionnaire developed by Smith, et al. After completing the training, 92% of residents stated having a better understanding of what it means to be patient-centered, 76% felt more skilled in communicating with patients and 57% reported being more patient centered. Moreover, 40% of residents noted feeling connected with their patients and reported being satisfied after patient encounters more often; roughly the same number of residents stated having empathy for their patients more often. 62% of residents stated their efficiency with each patient encounter had improved.

DISCUSSION/REFLECTION/LESSONS LEARNED: A focused curriculum on evidence based, patient-centered communication improved self-perceived resident communication, empathy and efficiency in primary care, while simultaneously enhancing resident satisfaction. It remains to be seen whether findings are sustained over time and whether this intervention impacts patient satisfaction.

BACK TO THE BEDSIDE IN THE OUTPATIENT SETTING: EXAM ROOM PRESENTATIONS IN RESIDENT CONTINUITY CLINIC Rachel Vanderberg; Carla Spagnoletti; Melissa McNeil. University of Pittsburgh Medical Center, Pittsburgh, PA. (Control ID #2701627)

NEEDS AND OBJECTIVES: Current literature suggests bedside presentations in both inpatient and outpatient settings are beneficial for patients and learners. Exam room presentations (ERPs) in resident continuity clinic (RCC) have the potential to meet several current needs in medical education including operationalizing ACGME Milestones through direct observation, improving patient satisfaction, and promoting patient centered care. Despite these benefits, we suspect the majority of case presentations in RCC take place away from the patient. At our institution, 65% of faculty preceptors reported never utilizing ERPs, while the remaining 35% reported using ERPs less than 25% of the time. We aimed to assess the feasibility of ERPs as a precepting model in RCC by identifying faculty perceived barriers.

SETTING AND PARTICIPANTS: General Internal Medicine faculty at the University of Pittsburgh who precept RCC.

DESCRIPTION: Faculty were invited to complete a survey regarding ERPs, defined as the initial case presentation and discussion in the exam room with both the patient and attending physician present. The survey asked them to rate 10 barriers to ERPs on the following scale: not a barrier, somewhat of a barrier, or a significant barrier. Faculty were then invited to an ERP workshop which included a PowerPoint presentation and video demonstration. Afterwards, faculty were encouraged to pilot ERPs in RCC over the next month with a goal of performing 1–2 ERPs per half day. After the pilot period, faculty were asked to complete the same survey.

EVALUATION: The response rate for the pre-survey was 74% (26/35). The most frequently perceived barriers (barriers rated as either somewhat or a significant barrier) included learner discomfort, time, and ability to review the chart at 96%, 92%, and 81% respectively. The response rate for the post survey was 71% (24/34) and 83% of the faculty indicated they tried an ERP at least once. In the post survey, 7, 83, and 62% of the faculty identified learner discomfort, time, and ability to review the chart, respectively, as barriers. Over half of the faculty felt that patient discomfort, attending physician discomfort, ability to write an attending attestation, and bedside teaching were not barriers to ERPs. Time was the most frequently identified barrier in the post survey and represented the most substantial barrier as 50% of faculty rated time as a significant barrier in both surveys. Despite these perceived barriers, 50% of the faculty, representing a 15% increase from the initial faculty usage rate, indicated they would continue to use ERPs.

DISCUSSION/REFLECTION/LESSONS LEARNED: Faculty consistently identified time as a barrier to ERPs in RCC. Learner discomfort and ability to review the chart were more frequently perceived as barriers to ERPs prior to the pilot period. Several faculty identified urgent care appointments as an ideal venue for ERPs in the comments section of the survey. We are currently seeking to further understand the role and feasibility of ERPs in RCC through qualitative work with faculty and residents.

BEDSIDE TRANSITION OF CARE AS A NEW ASSESSMENT TOOL OF NIGHT FLOAT RESIDENTS Mark Ridder; Ali Al-Hilli; Adnan Kiani; Ateeq Rehman. Marshfield Clinic, Marshfield, WI. (Control ID #2703039)

NEEDS AND OBJECTIVES: Residency programs are using a night float rotations system to manage duty hour restrictions. There are notable advantages and disadvantages to this system. Feedback from supervising physicians to residents during night float is very limited, mainly due to the lack of opportunities direct observation of residents' performance. Whilst it has been hypothesized that this period of attending-resident dissociation is crucial to the development of residents' confidence, as they transition from being constantly supervised to functioning independently, constructive feedback from attendings remains paramount to their professional development. Our literature review revealed only a few studies that assessed resident and patient attitudes towards this approach.

SETTING AND PARTICIPANTS: The key participants during this signout are the patient, the admitting night float residents, the day team including the attending, residents, students and the patient's nurse. The night float residents deliver the signout at the bedside.

DESCRIPTION: Our residency program has transitioned from a milestone-based curriculum to one that relies upon Observable Practice Activities (OPAs). We began utilizing post-call, bedside signouts as part of our night float curriculum since the beginning of 2016. This information exchange includes all the key components of the history and physical with a focus on the assessment and plan, using language that is understandable by the patient. Patients are encouraged to participate in the discussions. This patient-centered activity is directly observed by the supervising attending to assess the strengths and weaknesses of the night float residents.

EVALUATION: We observed that this method of rounding does not significantly lengthen the duration of signouts compared to traditional table signouts. In addition, patients who received care through this method perceived that they had spent more time with their medical team and were more satisfied with their care.

DISCUSSION/REFLECTION/LESSONS LEARNED: Our reflection upon this innovation demonstrates that bedside signouts to transition patient care

from the night float team to the day team provide a feasible new valuable OPA opportunity, to facilitate attending evaluation of residents, with the added benefit of delivering high-quality patient-centered care.

BEYOND THE TEACHING CLINIC: BUILDING RESILIENCE THROUGH CARE COORDINATION

Catherine Jones[2]; Anjali Niyogi[1]; Ashley Wennerstrom[2]. [1]Tulane University, New Orleans, LA; [2]Tulane University SOM, New Orleans, LA. (Control ID #2706212)

NEEDS AND OBJECTIVES: provide important systems navigation services utilizing trained medical students as care coordinators; Understand the importance of prioritizing systems navigation education in early clinical education, Identify opportunities to build curriculum around care coordination within the continuum of medical education, Articulate the connection between resilience and the creation of integrated systems navigation programs for medical learners,

SETTING AND PARTICIPANTS: Medical students functioned as care coordinators in several settings focusing on vulnerable patients: 1) Luke's House, a free clinic serving primarily undocumented immigrants; 2) the Student Hotspotting program and the Social Contexts in Medicine programs, which train students in a robust social determinants of health curriculum before they go on to provide support for high utilizers; and 3) the Formerly Incarcerated Transitions clinic, in which students support people recently released from incarceration in accessing primary healthcare and other wraparound services.

DESCRIPTION: Healthcare systems are constantly evolving, particularly with new legislative changes aimed at serving an aging population with complex medical needs. Best outcomes now require familiarity with systems-based practices, in addition to medical knowledge. Training in system-based coordination and provision of care can begin in medical school. One way to incorporate students into this learning process is to provide opportunities for students to assist patients in navigating the complex healthcare system. Immediately after Hurricane Katrina, at a time when our local urban underserved population had scant options for healthcare, student run clinics emerged throughout New Orleans. However, the development of local health infrastructure including community health centers has now made the role of student clinics unclear. Students and faculty have come to conceptualize a new role for students and their clinics, focused on identifying and solving health care system problems by de-prioritizing traditional clinical shadowing experiences in favor of building a network of trained, committed student care coordinators to assist patients in navigating the larger healthcare system.

EVALUATION: Evaluation has occurred in all contexts, with the aims of ensuring that patients receive the followup care they need. This is achieved by personal phone calls to participants and chart checking the medical records.

DISCUSSION/REFLECTION/LESSONS LEARNED: As a result of these programs, students have gained confidence with local resources and systems navigation, as well as real-life knowledge of how the social determinants of health impact patients' health outcomes. Preliminary data show increased linkage to primary care and decreased utilization of acute care services for primary care needs among small sets of patients in some of these settings.

BEYOND TRADITIONAL ROLE PLAY: PRACTICING COMMUNICATION SKILLS DURING INTERN SIMULATION "BOOT CAMP"

Katherine A. Iossi[1, 2]; Craig Tanner[2, 3]; Megan Moody[1]. [1]Portland Veterans Affairs Healthcare System, Portland, OR; [2]Oregon Health and Science University, Portland, OR; [3]Legacy, Portland, OR. (Control ID #2707119)

NEEDS AND OBJECTIVES: Concerns existed that residents had deficits in skills traditionally taught "on-the-job" or experientially that were not covered in our core curriculum. We planned a 5-day simulation "boot camp" to teach skills in procedures, clinical reasoning under pressure, and communication. We developed the 1/2 day communciation session. Objectives: Practice a tool to facilitate improved code status discussions Practice 2 methods to improve communication during difficult conversations Give and receive specific behavioral feedback around communication skills Develop increased confidence in having difficult conversations

SETTING AND PARTICIPANTS: −Mid-sized academic program, 30 categorical interns -Intern Intensive "boot camp" took place at OHSU's Sim Lab −1/2 day on communication with 5–6 interns per group, repeated x6

DESCRIPTION: Residents, staff, and leaders in communication skills were surveyed on skills interns should learn early. Teaching methods were identified including a) Traditional role play using SPAM, a pneumonic tool described in the literature to guide code status discussions, with simple cases; and b) The Vital Talk method described by Back et al. for providers to practice skills with an actor while learning to give and receive specific behavioral feedback in a peer group. Materials can be shared with credit. Cases were adapted for interns and actors trained. ½ Day Agenda: 1-SPAM Overview: Surrogate, Prior stated preference, Assume full code, More later 2-SPAM Role Play: simple Code Status scenarios acted out with one intern as patient and one as provider 3-Overview of tools to address emotion: a) Ask-Tell-Ask, b) NURSE pneumonic (name the emotion, understand, respect, support, explore) + wish/worry statements 4-Vital Talk Role Play with actor as patient's family member - each intern in the "hotseat" with actor once -intern identifies a skill to practice, others instructed to take note of specific words that promote reactions in actor, timeout when encounter gets difficult(actor trained to be filled with emotion) -group shares specific words that elicited positive response in actor -intern in hotseat identifies the hard part, seek suggestions of words to try from group -intern re-enters encounter with words to address emotion, actor trained to authentically respond to emotions being addressed, time called when intern addresses emotion -intern states take-home point 5-Closing -handout given with tools and references -interns write note with skill they want to be practicing 6 months from now to be mailed then

EVALUATION: −Received IRB approval for pre/post surveys -Interns rated usefulness of session high and noted improved confidence having difficult conversations -Positive feedback from instructors and actors

DISCUSSION/REFLECTION/LESSONS LEARNED: −Interns learn as much observing as in the hotseat -Interns requested more VItal Talk practice, specifically in goals of care -We must train actors to have strong emotion entering encounter

BRIDGING THE GAP: CREATING AN INTERDEPARTMENTAL QUALITY AND SAFETY ENGAGEMENT CURRICULUM FOR TRAINEES

Julie Oyler[3]; Nancy Schindler[1]; Ajanta Patel[2]; Vineet M. Arora[3]; Kristen Hirsch[2]. [1]NorthShore University HealthSystem and University of

Chicago, Skokie, IL; [2]University of Chicago, Chicago, IL; [3]University of Chicago Medical Center, Chicago, IL. (Control ID #2705574)

NEEDS AND OBJECTIVES: Recent guidelines from the ACGME Clinical Learning Environment Review (CLER) recommend residents receive formal training in quality improvement and patient safety (QI/PS). Our objective was to design an educational intervention for post graduate year 1 (PGY1) trainees in surgery, pediatrics and internal medicine introducing them to hospital and educational leaders while learning the basics of quality improvement and patient safety. Sepcifically to: 1. Build trainees' foundational knowledge of core principles of QI/PS 2. Engage trainees in institutional QI/PS priorities 3. Meet CLER and ACGME recommendations for QI/PS education

SETTING AND PARTICIPANTS: In September 2015, 79 PGY1 residents in surgery, pediatrics, and internal medicine took a pretest, evaluating knowledge and attitudes of basic QI/PS. Based on this needs assessment, learning objectives were identified in three areas: quality improvement, quality assessment, and patient safety. Residency program directors for the three core programs approved the learning objectives and the Graduate Medical Education (GME) office supported the curriculum.

DESCRIPTION: During the 2015–6 academic year, QI educators and hospital leaders delivered 3 required one hour lectures to PGY1's. The first session included a review of root cause analysis/event reporting and completion of a fishbone analysis. The second lecture included review of internal and external quality metrics. Finally, hospital quality annual goals were reviewd and PGY1's developed aim statements, QI measurements, and proposed interventions for one of the hospitals priority metrics.

EVALUATION: Learner assessment included pre-post knowledge tests and activities to assess skills. Pretest completion rates were high (surgery (9/9, 100%), pediatrics (23/23, 100%), IM (41/46, 89%), and overall (73/79, 92%). 65% of PGY-1s reported brief quality training in medical school; 90% reported brief safety training. The curriculum pre-test resulted in a mean and median score of 43.5% (10/23 points, range 22%-78%). On average, learners showed better knowledge of core QI/PS principles (mean score 48.2%) than of institutional QI/PS priorities (33.6%). On 5-point Likert scales, residents had strong positive responses regarding the importance of QI/PS to their education (4.6 and 4.8), but low confidence of their knowledge of institutional procedures (2.3 - 2.6). Familiarity with hospital leadership was modest on Likert scale and knowledge questions.

DISCUSSION/REFLECTION/LESSONS LEARNED: Our pre-test data suggests that training on QI/PS is needed during residency. We demonstrated feasibility of an interdepartmental QI/PS curriculum to meet national training guidelines and learning objectives. Our future plans include roll out to all PGY-1's and first-year fellows. We learned that an interdepartmental curriculum supports efficient use of faculty and administrative resources while achieving CLER goals. Using hospital senior administrators as teachers fosters resident engagement with hospital priorities.

BRINGING DESIGN THINKING TO MEDICAL EDUCATION: STUDENT DESIGN PARTNERS AS CURRICULUM CO-CREATORS

Daniel R. Wolpaw; Kevin Black; Terry Wolpaw. Penn State College of Medicine, Hershey, PA. (Control ID #2704762)

NEEDS AND OBJECTIVES: Design Thinking features cycles of 1) discovering end-user perceptions, 2) exploring opportunities, 3) generating and testing prototypes, and 4) analyzing/evolving results. Our project objective was to build on the experience of Olin College of Engineering to embody the principles of design thinking in "Student Design Partners" (SDPs) as part of our efforts to take a fresh look at medical education at an expanding regional campus.

SETTING AND PARTICIPANTS: Five SDPs, admitted to Penn State College of Medicine in 2016, deferred matriculation for one year to co-create and pilot elements of a curriculum planned for Penn State's University Park medical school campus. SDPs received a one-year stipend and subsequent scholarship support.

DESCRIPTION: SDPs and faculty participated in iterative cycles of Design Thinking focusing on 1) "mapping" the geography, population, society, and culture of the region, 2) developing immersive patient-navigator experiences in regional primary care practices, 3) shaping processes for small group inquiry-driven learning, 4) piloting formative narrative-based assessment strategies, and 5) mapping learning objectives and applying the science of learning to educational design.

EVALUATION: SDPs kept daily logs of their experiences and reflections, shared narratives and recommendations with faculty, and learned to apply qualitative research methods to this data to support design thinking cycles. Among the curricular processes that evolved substantially during the design year were: a) development of clinical immersion sites, b) balancing clinically driven inquiry with the achievement of core educational milestones, c) developing aligned assessment strategies, and d) engendering learner confidence in novel educational designs.

DISCUSSION/REFLECTION/LESSONS LEARNED: 1) SDPs contribute on the dance floor (curricular pilots) and from the balcony (critiquing, revising and planning). Despite the inherent tension in these simultaneous roles, SDPs found their balcony views, focused by a growing understanding of education science and supported by faculty collaboration and mentorship, to be important in modulating the uncertainty of new curriculum designs. 2) The almost total inclusion of SDPs in curriculum planning has been "liberating" to faculty long accustomed to planning education and later negotiating learner reactions. 3) It is possible to create learner roles that embody principles of Design Thinking. Our goal is to support this design mindset in succeeding cohorts of students to keep education programs fresh and dynamic.

BRINGING RESIDENT REPORT PEARLS FOR ALL: ONE CHIEF RESIDENT BLOG POST AT A TIME

Irina Kryzhanovskaya; Myung S. Ko. UCSF, San Francisco, CA. (Control ID #2707556)

NEEDS AND OBJECTIVES: Promoting adult learners to continue their education independently is one of the most important objectives of graduate medical education (GME). A common example of this occurring in Internal Medicine residency programs nationwide is a chief resident-facilitated case conference, also known as Resident Report. However, little is known about whether the clinical cases or concepts discussed during report leave a lasting impact on the resident learners, particularly as the busy clinical context may detract from knowledge acquisition, retention, and optimization of the learning climate. The objective of our project was to use an online blog organized by chief residents to summarize the salient teaching points from report, reference key literature, and provide a way for residents to reinforce concepts independently.

SETTING AND PARTICIPANTS: This project took place within the Internal Medicine Residency Program at University of California at San Francisco (UCSF). Participants included chief residents at each of three UCSF-affiliated Hospitals, and the resident physician trainees enrolled in the UCSF IM Residency Program.

DESCRIPTION: Following every Resident Report, the chief residents at each hospital submit a one page blog post detailing the learning points derived from each report session. Each entry starts with a de-identified "one-liner" for the patient case followed by pertinent clinical pearls from the discussion. The posts end with a link to a notation program (Evernote) to allow for resident and faculty subscribers to use the pearls in their own teaching materials in the future. The blog can be accessed easily from online search engines, and the platform generates daily emails to subscribers when a post is completed.

EVALUATION: The chief resident blog has 711 posts to date with a total of 12,525 visitors, 40,114 views, and 51 subscribers. We plan to evaluate the effectiveness of the blog by organizing resident focus groups and circulating a residency-wide survey on the utilization and clinical relevance of the website. The goal will be to understand how the blog is used by learners and its impact on knowledge retention as well as other functions like future clinical teaching and patient care.

DISCUSSION/REFLECTION/LESSONS LEARNED: Little is known about best practice for using online blog posting for dissemination of teaching material from resident reports or case conferences in GME. We hope to demonstrate widespread use of the blog as an effective complement to resident report teaching and assess its impact on knowledge retention by residents, clinical teaching, and patient care.

ONLINE RESOURCE URL (OPTIONAL): https://ucsfmed.wordpress.com/

BUILDING A 4-YEAR MEDICAL STUDENT SUBSTANCE MISUSE CURRICULUM Sandeep Kapoor[1, 3]; Tamar Harel[3]; Judith M. Brenner[3]; Joseph Conigliaro[1, 3]; Jeanne Morley[1, 3]; Mark Auerbach[2]; Jonathan Morgenstern[2]; Nancy Kwon[2]; Lauren Block[1, 3]. [1]Northwell Health, Lake Success, NY; [2]Northwell Health, Great Neck, NY; [3]Hofstra Northwell School of Medicine, Hempstead, NY. (Control ID #2702746)

NEEDS AND OBJECTIVES: Our objective was to implement a four-year longitudinal curriculum aimed at improving knowledge, attitudes, and skills in substance misuse screening, brief intervention, and treatment (SBIRT) among medical students.

SETTING AND PARTICIPANTS: The study participants included 100 MS1 and 100 MS2 students at Hofstra Northwell School of Medicine during the 2015–2016 academic year. The curriculum description extends to the MS3 and MS4 student cohorts (see URL).

DESCRIPTION: Our curriculum was collaboratively taught by communications and SBIRT faculty and health coaches. The first year medical student (MS1) session addressed knowledge, skills and attitudes (*KSA*) in regard to the spectrum of alcohol use. Session components included an Alcoholics Anonymous meeting with a reflection (*A*), pre-reading, and large group discussion on screening for alcohol misuse (*K*). Standardized patients (SPs) were included to add authenticity to role-plays (*S*). The second year (MS2) curriculum extended *KSA* by focusing on drugs of abuse. Pre-reading (*K*) focused on interventions for patients who screen positive for substance abuse. Students were taught and practiced a brief negotiated interview (BNI) approach with SPs (*S*). Students were offered an opportunity to work with a health coach in practice (*A*). During the third year, a case-based conference provided a knowledge and skills refresher. An OSCE and a final essay question were added for all MS3 students. An elective rotation in SBIRT was offered to all MS3 and MS4 students.

EVALUATION: An evaluation of the curriculum was conducted by examining: 1) MS1 and MS2 final essay data (*K*); 2) MS1 and MS2 clinical skills assessment data (*S*); 3) pre- and post-session survey data (*A*); and 4) student evaluation data (*feedback*). Quantitative pre- and post-session survey data was analyzed using t-tests. *Knowledge* A total of 98 and 100% received passing scores on the exam question in the MS1 and MS2 cohorts. *Skills* Checklist questions were scored by SPs trained to the cases. A total of 93%, 99%, and 93% of students received full credit in the following categories: screening, being non-judgmental, and patient education. Seventy one percent of MS2s provided feedback on SP alcohol use, a second-year skill. *Attitudes* Following the session, students were more likely to agree that incorporating SBIRT into medical practice is important (4.4 vs. 4.1 on 1–5 Likert scale, $p < 0.01$). Students reported being more comfortable asking patients about substance use (3.6 vs 2.8, $P < 0.001$) and assessing patient readiness to change (3.7 vs 2.9, $p < 0.001$). *Feedback* Eighty nine percent of students agreed the session enhanced their learning and 89% felt the session fostered active learning.

DISCUSSION/REFLECTION/LESSONS LEARNED: We designed, implemented, and evaluated a four-year curriculum on substance misuse screening and counseling. First and second year student data suggests the curriculum enhanced student knowledge, skills, and confidence in practicing SBIRT techniques.

BUILDING RESILIENCE, BOOSTING COMMUNITY, AND PROMOTING MEDICAL EDUCATION RESEARCH: CENTER FOR EDUCATIONAL INNOVATION AND SCHOLARSHIP Arabella L. Simpkin[1, 2]; Katrina Armstrong[1, 2]; Alberto Puig[1, 2]; Stephen B. Calderwood[1, 2]. [1]Massachusetts General Hospital, Boston, MA; [2]Harvard Medical School, Boston, MA. (Control ID #2672282)

NEEDS AND OBJECTIVES: We are in an exciting phase of healthcare transformation with a consequent responsibility to train physicians to thrive in a changing environment. This is driving a growing recognition of the need to create new approaches to education delivery and to nurture leaders of education reform. To address this challenge we developed a Center for Educational Innovation and Scholarship (CEIS) at Massachusetts General Hospital (MGH) that aims to: promote development and evaluation of innovative educational approaches; advance medical education scholarship and investigation; foster faculty development; and provide mentorship to boost a sense of community, and consequently build resilience, among medical educators.

SETTING AND PARTICIPANTS: Catalyzed within the Department of Medicine at MGH, the CEIS is now home to 80 faculty and fellows across six Departments (Medicine; Surgery; Emergency Medicine; Anesthesiology; Pediatrics; Obstetrics & Gynecology).

DESCRIPTION: In meeting the mission of the CEIS to engage, enthuse, and educate faculty and fellows in medical education research, we developed a monthly "medical education think-tank" where two scholars present specific

questions/hurdles for discussion with the group to empower peer learning, inspire ideas and collaborations, and share best practices for educational strategy. Internal grant funding is available to support projects. To develop and enhance skills, we are running the AAMC Medical Education Research Certificate (MERC) workshops.

EVALUATION: To evaluate success of the CEIS, we are measuring: faculty demand/satisfaction (community at monthly meetings); faculty engagement in education research (presentations/publications); commitment to development of education research skills (achievement of MERC qualification); collaboration on projects across departments; successful grant applications; implementation of innovative educational strategies; and academic promotion.

DISCUSSION/REFLECTION/LESSONS LEARNED: Looking toward global needs in the 21st century, experts have called for a new wave of medical education reforms. The CEIS aims to encourage physicians to enter this space, promoting focus on research and innovation. We have seen the rapid creation of a multidisciplinary community, which we hope will bridge silos and help build resilience among faculty. We have reflected on the challenges in this emerging space, including the paucity of external grants to adequately protect faculty time, and the need to expand our view of scholarship (and markers of success) recognizing newer peer-reviewed journals, those with lower impact factors, and acknowledgment of the influence and importance that the 'grey literature' (blogs, social media posts) has on dissemination of findings. Innovation Centers can ensure academic health centers optimize their teaching and research missions, enhancing value through leadership, education, engagement, and scholarship for the benefit of both the physician and patient experience. It is only by embracing efforts in this arena that we will thrive in the next era.

BUILDING SKILLS AND REKINDLING JOY: A CME COURSE ON CARING FOR VULNERABLE PATIENTS

Katherine Lupton[1]; Margaret B. Wheeler[2]; Dean Schillinger[1]. [1]University of California San Francisco, San Francisco, CA; [2]University of California, San Francisco, San Francisco, CA. (Control ID #2707028)

NEEDS AND OBJECTIVES: The care of patients who are vulnerable and underserved is complex; a purely biomedical approach cannot address the many medical, psychosocial and societal factors complicating their care. Few formal professional development opportunities provide guidance on working with underserved populations. Providers' lack of confidence and competence contribute to both inequities in care and provider burnout. We designed a Continuing Medical Education (CME) course with the following objectives: 1. Provide evidence-based strategies for working with marginalized patients 2. Fill an unmet need for professional development relevant to vulnerable patients 3. Foster a supportive community of like-minded providers working with the underserved

SETTING AND PARTICIPANTS: Our course was offered through the University of California San Francisco Office of CME. In the inaugural year, 166 health care professionals attended. The majority were in primary care: 70% were physicians, 20% mid-level practitioners, and the remainder nurses and allied health professionals. Though most were from California, 16 states and Canada were also represented.

DESCRIPTION: "The Medical Care of Vulnerable and Underserved Patients" is a 3-day CME course open to all health professionals. We began by conceptualizing social vulnerability as it pertains to patient care, followed by topics relevant to the care of patients who are poor and ill. Content experts presented each area, ranging from disease-specific management in vulnerable patients to population-specific topics. Content promoting provider well-being included personal reflections from the safety net, a burnout prevention workshop, and brainstorming around the creation of an on-line community.

EVALUATION: 98 of 166 attendees (59%) completed course evaluations. All lectures and workshops were highly rated; average scores for each talk and the overall course exceeded 4.5 out of 5. After attending, over two-thirds reported "somewhat more" or "much more" (a) knowledge and (b) confidence caring for vulnerable patients; over 60% reported gaining new strategies and skills. Almost 80% felt "somewhat more" or "much more" re-energized in their work. Thirty-five percent predicted feeling "somewhat less" or "much less" burnout in the future.

DISCUSSION/REFLECTION/LESSONS LEARNED: Course evaluations demonstrate that we filled a need for CME training specific to working with underserved patients. The potential impact on re-energizing providers and mitigating burnout was striking, and will be explored at future course offerings. A CME course that develops a shared understanding of complex socio-medical phenomena, focuses on approaches to care for underserved patients, and promotes a sense of community and higher mission is feasible and effective.

CAPITALIZING ON AUTHENTICITY: IMPLEMENTATION OF A SKILLED NURSING FACILITY BASED INTERPROFESSIONAL GERIATRICS ELECTIVE

Laura K. Byerly[1, 2]; Leslie C. Floren[1]; Bridget C. OBrien[1]; Michi Yukawa[1, 2]. [1]University of California, San Francisco, San Francisco, CA; [2]San Francisco VA Medical Center, San Francisco, CA. (Control ID #2693364)

NEEDS AND OBJECTIVES: Geriatrics, especially within a skilled nursing facility (SNF) such as the VA's Community Living Center (CLC), can provide much needed authentic and practical interprofessional (IP) clinical and teamwork exposure for health professions students. Such experiences must be carefully designed to maximize IP student learning. We present the design and implementation of a novel IP SNF geriatrics elective that engages medical (MD), pharmacy (PH), and physical therapy (PT) students in collaborative care. Course objectives focus on 4 geriatric competencies common to all 3 professions: 1) Identify medications to be avoided/used with caution in geriatric patients, 2) Construct IP patient care plans, 3) Evaluate patients with recent falls/construct fall prevention plans, and 4) Work cooperatively on patient-centered IP teams.

SETTING AND PARTICIPANTS: The San Francisco VA CLC cares for >100 veterans on IP teams including faculty/staff in medicine, nursing, pharmacy, rehabilitation, social work, nutrition, recreation therapy, and spiritual care. Our IP elective includes 4th year MD, 4th year PH, and 3rd year PT students.

DESCRIPTION: Our 2-week elective activities focus on geriatric IP care for CLC patients. IP student teams engage with 6–8 CLC residents by: evaluating functional status/fall risk, participating in medication reviews, and presenting at CLC IP team meetings. Student teams huddle daily to discuss clinical and team challenges; they have dedicated team time to review charts, brainstorm care plans, and develop recommendations. We developed multiple assessment tools aligned with course objectives, including pre- and post-course assessments regarding geriatric competencies, 360-degree self and CLC team assessments, and team note rubrics.

EVALUATION: Twenty-three students (11 MD, 11 PH, 2 PT) enrolled in the 2016–17 pilot. Preliminary feedback from students ($n = 10$) suggests this

course fills important gaps (SNF setting, IP teams) in their education; all felt integral to the CLC team, had meaningful IP staff/faculty interactions, and engaged in valuable real-world patient encounters. Challenges identified by students include role uncertainty in unfamiliar activities and differing personal goals. Elective development and implementation challenges include negotiating CLC space and allotting adequate time and activities for meaningful learning experiences across multiple professions, as well as administrative time needed to coordinate schedules, recruit faculty and identify patients.

DISCUSSION/REFLECTION/LESSONS LEARNED: This project showcases the potential for engaging IP learners in a typically untapped SNF model of care. The SNF environment allows for authentic application of IP team learning and is an exciting option to consider for advanced student teaching. Administrative commitment to ensure meaningful and well-structured student experiences is critical, as is development of materials and activities capable of engaging all levels/types of IP learners. Our experience provides insights that could help others create similar IP SNF electives.

CARING FOR OUR MOST VULNERABLE: DEVELOPING A FACULTY CULTURE FOR INTERPROFESSIONAL EDUCATION IN A CLINIC FOR HOMELESS VETERANS Carole Warde[1]; Briana Cowan[1]; Lillian Gelberg[1]; Margi Stuber[2]; Janette Lie[3]; Kristin Kopelson[3]; Meredith Magner-Perlin[1]; Peter Capon-Newton[1]. [1]Greater Los Angeles VA Health System, North Hills, CA; [2]Greater Los Angeles VA Medical Center, Los Angeles, CA; [3]Greater Los Angeles VA Health System, Los Angeles, CA. (Control ID #2706933)

NEEDS AND OBJECTIVES: Homeless Veterans have complex medical, social and psychosocial needs that are best addressed by high-functioning interprofessional care teams. We describe a faculty development program to promote a culture of interprofessionalism, humanism, and self-care within a VA-homeless patient aligned care team (HPACT) in preparation for implementing an interprofessional academic training program (IATP).

SETTING AND PARTICIPANTS: The VA Office of Academic Affiliations Centers of Excellence (CoE) in Primary Care Education supported the development of this IATP in a large homeless clinic (HPACT). The health care teams utilize clinical teams that include nursing, social work, mental health, pharmacy and primary care disciplines; they work closely work with VA-funded housing programs. The included health professional training programs mirror the team composition.

DESCRIPTION: Faculty from all represented professional training programs participated in faculty development six months prior to trainee arrival. Their learning emphasized role modeling and communication skills to promote a culture of interprofessionalism, humanism, and self-care. Leadership structures and learning exercises were designed to embody four goals. 1) Culture of interprofessional collaboration: Core faculty practiced together managing a shared patient panel, often in multidisciplinary visits. Team huddles were adapted from the traditional medical-nursing model to incorporate mental health and social work professionals. Each profession defined terminology and developed a shared language relevant to all. 2) Culture of shared decision-making: Weekly leadership meetings encouraged participation of all professions. Meetings utilized rotating leadership roles, shared agenda setting, time-keeping, and structured facilitation. Reflection at the end of meetings focused on process improvement. 3) Culture of humanism and sustained relationships: Faculty development sessions used storytelling, active listening, awareness of self and colleagues to promote humanistic qualities and understanding of the social determinants of health determinants. 4) Culture of self-care: meetings began with mindful meditation and/or check-ins.

EVALUATION: Feasibility, efficacy, and favorability of the faculty development program are being formally assessed using qualitative and quantitative methods, including semi-structured in-depth interviews and questionnaires with program faculty.

DISCUSSION/REFLECTION/LESSONS LEARNED: A faculty culture of interprofessionalism, communication and self-care for IPE in a clinic for homeless Veterans developed as a result of longitudinal relationships characterized by shared trust, respect, psychological safety and consensus decision-making. Existing dysfunctions in the clinical culture and the traditional professional hierarchy are barriers that we have had to address. A healthy faculty culture is necessary to sustain the tenacity, creativity and teamwork required to care for Veterans with complex needs and to develop an IP training program.

CHAMPION PROVIDER FELLOWSHIP: ENHANCING PHYSICIAN ENGAGEMENT IN OBESITY PREVENTION Vanessa Thompson[1]; Alana Pfeffinger[3]; Alicia Fernandez[1]; Dean Schillinger[1]; L. E. Goldman[2]. [1]UCSF, San Francisco, CA; [2]University of California San Francisco, San Francisco, CA; [3]University of California, San Francisco, San Francisco, CA. (Control ID #2706675)

NEEDS AND OBJECTIVES: The 2012 IOM *Report on Obesity* urged providers to “advocate for institutional, community and state-level strategies to improve physical activity and nutrition resources for patients and communities.” This recommendation represents a shift in the traditional role of the physician - moving from interventions with individuals in the clinic to upstream interventions that prevent disease in the community. The skills and knowledge of policy, systems and environmental (PSE) change strategies required for this advocacy work are not included in most traditional clinical training programs. The Champion Provider Fellowship (CPF) was developed as an innovation in continuing medical education to fill this gap to enable healthcare providers to advocate for change.

SETTING AND PARTICIPANTS: Primary care physicians in California with a commitment to obesity prevention were recruited through partnerships with California statewide healthcare organizations, professional societies and county health departments. 41 actively practicing physicians and dentists from throughout California were recruited.

DESCRIPTION: The fellowship was developed as a partnership between the California Department of Public Health and the University of California, San Francisco. Selected participants attended a two-day initial training on the need and skills for policy, systems, and environmental change in obesity prevention. The CPF also provided participants with ongoing training, technical assistance and community connections to support physician work-plans. Key strategies for ongoing support of program participants included 1) a webinar series; 2) a year-two skills booster; 3) ongoing individualized technical assistance; and 4) facilitated county-specific meetings.

EVALUATION: The evaluation of program success focused on provider engagement by cataloging activities. Providers completed an electronic survey at 9 months and 18 months to capture self-reported activities related to obesity prevention. Activities were categorized by target level in the socio-ecological model, focus within obesity prevention and activity type. Survey response rate was 50% ($n = 22$). Of these, 86% ($n = 19$) were actively engaged in obesity

prevention efforts and 91% ($n = 20$) had discussed obesity prevention with their local health department. Fellows felt highly engaged and energized by participation, and strongly planned to continue their participation in the CPF and obesity prevention activities. Barriers to engagement included competing time constraints and lack of resources.

DISCUSSION/REFLECTION/LESSONS LEARNED: Practicing physicians can develop the knowledge and skills to use their respected status in the community to support advocacy efforts to prevent obesity. Because physician time is limited, models that link providers with their local health departments and other community-based organizations can provide busy clinicians with opportunities to leverage their unique voice in the community and enhance physician sense of wellbeing.

ONLINE RESOURCE URL (OPTIONAL): championprovider.ucsf.edu

CHANGING AN AMBULATORY CULTURE ONE DIDACTIC AT A TIME: USING INTERPROFESSIONAL CURRICULAR INNOVATIONS TO UNIFY A PATIENT CENTERED MEDICAL HOME

Jennifer Verbsky1; Frank Cacace[1]; Jason Ehrlich[1]; Daniel J. Coletti[1]; Nissa Mazzola[2]. [1]Hofstra Northwell School of Medicine, Great Neck, NY; [2]St. John, Queens, NY. (Control ID #2705805)

NEEDS AND OBJECTIVES: An increasing number of primary care practices across the country are becoming Patient Centered Medical Homes. This should create curricular and workflow collaboration that benefits multiple interprofessional (IP) learners. Internal medicine residents may possess a limited understanding of non-physician team members' scopes of practice and have little experience with collaborative care. The Division of General Internal Medicine at Northwell Health sought to create IP ambulatory curricula that integrate non-physician team members to improve residents' knowledge of their colleagues' roles and foster a more collaborative educational and clinical environment.

SETTING AND PARTICIPANTS: Over a 2 year period, IP curricula were developed by internal medicine faculty, clinical pharmacists, and a clinical psychologist. These were delivered via our weekly ambulatory team based learning (TBL) conferences and our ambulatory academic half day conferences. Participants included 150 internal medicine residents, 25 pharmacy students, 3 PA students, 4 nurses, 4 medical assistants, 2 secretaries, and 2 social workers.

DESCRIPTION: We started by enriching our TBL modules to include learning objectives written by our pharmacists on drug management and our psychologist on behavioral health issues in the chronically ill. We then began incorporating pharmacy students as active participants, 1) working alongside senior medical residents during TBL to create a metabolic syndrome medical jeopardy game board for juniors highlighting indications, side effects, and medication dosages, and 2) teaching residents indications for key vaccines during an academic half day session on preventative care. Most recently, we integrated our non-clinician staff during a "family feud" game where residents listed the perceived responsibilities of our secretaries, nurses, medical assistants, social workers and pharmacists and perceptions were compared to the staff's subsequent answers. This activity catalyzed subsequent resident and staff collaboration on joint ambulatory quality improvement projects, which concluded the session.

EVALUATION: Qualitative data reflected a high level of satisfaction among non-clinical staff members. We plan to survey residents and all IP learners about their satisfaction with these sessions, improved knowledge of team members' roles and responsibilities, and potential impacts upon patient care and outcomes.

DISCUSSION/REFLECTION/LESSONS LEARNED: We believe that these IP didactics will deepen the appreciation of all team members and learners in our clinic. Sharing curricular design and delivery has also been a boon for division members traditionally shouldering the workload.

COACHING RESIDENTS IN THE AMBULATORY SETTING USING DIRECT OBSERVATION TO FACILITATE DELIBERATE PRACTICE

Ryan Graddy; Stasia Reynolds; Scott Wright. Johns Hopkins University School of Medicine, Baltimore, MD. (Control ID #2698179)

NEEDS AND OBJECTIVES: Direct observation of clinical practice is essential for accurately assessing residents and providing specific feedback. Opportunities to do this are infrequent, especially in busy outpatient teaching practices. We aimed to assess the acceptability and utility of a direct observation and coaching intervention in a resident GIM ambulatory practice.

SETTING AND PARTICIPANTS: The Johns Hopkins Bayview GIM Clinic is a mixed faculty/resident practice in which all residents care for their own patient panels and are precepted by primary care faculty. Although preceptors are encouraged to supervise and teach residents in the exam rooms, direct observation of complete patient visits is rare.

DESCRIPTION: The authors developed a 33 item "yes/no" behavioral checklist for direct observation linked to published tenets of clinical excellence. The checklist is divided into 6 domains: professionalism & humanism, communication, EMR use, diagnostic acumen, navigation of the healthcare system, and knowledge. Two faculty members with clinical precepting and coaching experience observed 47/48 IM residents during an entire patient visit in the fall of 2016, using the checklist to guide their formative evaluation. After each encounter, residents used the same checklist for self-assessment. Self-assessments were compared with what was noted by the coaches and were reviewed during formal feedback coaching sessions. Finally, residents completed an evaluation of the coaching experience and listed objectives for improving their performance.

EVALUATION: The most regularly performed behavior was listening attentively (100%), while least frequent was the acknowledgement of the role of the computer in the visit (39%). Areas of inaccurate self-assessment were identified where resident checklist answers differed from faculty (discordant responses). 18% of responses were discordant. The behaviors most commonly self-reported as completed but not observed by preceptors were collaboration with the patient when using EMR (36% of residents), handwashing (31%), and acknowledgement of the role of the computer in the visit (20%). The most common resident goals for improvement following coaching were partnering with patients (48%), agenda-setting/time management (43%), and optimizing EMR use during the encounter (35%). Residents consistently rated the coaching experience as one that was comfortable and added value beyond traditional precepting. All (100%) expressed interest in receiving additional coaching. At 1 month follow-up, 22/23 respondents reported that they had changed their practice based on self-identified goals for practice improvement.

DISCUSSION/REFLECTION/LESSONS LEARNED: Directly observed resident outpatient clinical visits by experienced preceptors identified important blind spots in resident self-assessment. Coaching sessions based on these

encounters were viewed favorably and helped residents to identify areas for improvement that led to behavior change. Direct observation and coaching, while time-intensive, is a valuable tool for resident ambulatory education.

COLLABORATING AT THE BEDSIDE: A SIMULATION-BASED CURRICULUM FOR INTERPROFESSIONAL EDUCATION michael picchioni. baystate medical center/tufts university, Springfield, MA. (Control ID #2707575)

NEEDS AND OBJECTIVES: Interprofessional Collaboration (IPC) is necessary for patient care yet Interprofessional Education (IPE) remains limited in professional training. Our aim was to create a well-received high value IPE learning experience resulting in greater competence in IPC.

SETTING AND PARTICIPANTS: Participants include third year medical students, nursing residents, and pharmacy residents and students who were doing their clinical training at an Academic Medical Center.

DESCRIPTION: Each participant completed an online module introducing IPC, a description of training in each profession, and core concepts in Teamwork. An introductory session brought participants together to familiarize them with the program, the Sim Lab and each other. Subsequently small teams with representatives of each profession addressed a series of 3 simulated-patient problems with a semi-structured debrief after each encounter. Various roles, contributions, communication, and elements of teamwork were emphasized.

EVALUATION: Effectiveness was measured by the validated IPC Competency Attainment Survey (ICCAS)[3] comparing pre- and post-intervention scores. A focus group was held for additional understanding of outcomes and suggestions on how to improve the program. Findings to date: ICCAS scores improved for nearly all 20 items. Small sample size limited statistical power with only one item ("express my ideas and concerns") reaching a $p < 0.05$. Given high baseline scores we looked at the "top box" score. The overall proportion who "Strongly Agree" with competency attainment increased from 26% to 49% with a trend toward significance ($p = 0.09$). Qualitative results supported these findings and identified themes of Trust, Mutual Respect, and Collaboration. The program was well received.

DISCUSSION/REFLECTION/LESSONS LEARNED: We attribute our success to the use of simulation which provides a shared clinical problem solving activity and using teamwork as an organizing theme. Previously we noted that poorly matched learners can limit or even undermine the learning goals. Each trainee must feel empowered to contribute and not overly relied upon to carry the group. We are nearing the ideal balance though pharmacy residents late in their training occasionally felt the latter. Future iterations will include pharmacy students or early residents.

CONNECTING THE DOTS: A RESIDENT-CENTERED APPROACH TO TEACHING PRACTICAL SKILLS IN AMBULATORY CARE Amy D. Lu[1]; Jaishree Hariharan[2]. [1]University of Pittsburgh Medical Center, Pittsburgh, PA; [2]University of Pittsburgh Medical center, Pittsburgh, PA. (Control ID #2706780)

NEEDS AND OBJECTIVES: Traditional model of ambulatory training employs a top-down, front-loaded approach where residents are given short clinic orientation, expectations, introduction to EMR, and directed to see patients under faculty supervision. No formal instruction follows to ensure residents are gaining practical skills required for success, leaving residents frustrated and overwhelmed. We developed an innovative curriculum with resident-centered workshops to build practical skills to excel in ambulatory care.

SETTING AND PARTICIPANTS: This pilot curriculum included 39 upper level residents in the general internal medicine continuity clinic at University of Pittsburgh medical center.

DESCRIPTION: Pre-intervention surveys were administered with questions directed at current confidence in completing routine clinic tasks using EMR, inter-visit care, and utilization of ancillary services. Residents rated their confidence in performing tasks using a 5-point Likert scale from "not at all confident" to "very confident". We implemented training workshops that highlighted nuances of EMR navigation to bolster clinic efficiency, standardized documentation to improve interdisciplinary communication, and resident-centered troubleshooting of practical ambulatory problems. Sessions were developed with resident input and led by rising chief medical residents with faculty facilitators during pre-clinic conferences. We also introduced monthly team meetings where residents discuss difficult patient cases with team-based staff including clinical pharmacist, social worker, and diabetic educator. Residents were again surveyed at 6 months on the same measures queried in the pre-intervention survey.

EVALUATION: Twenty-six of 39 residents completed the pre-intervention survey and 25 residents completed the 6-month follow-up survey. In our preliminary analysis, the percentage of residents who felt "pretty confident" or "very confident" in using the EMR for routine clinic tasks increased from 40% to 77% after the workshops. Similarly, the proportion of residents who felt confident with managing inter-visit care including triaging patient telephone encounters and responding to test results increased from 42% to 77 and 37.5% to 61.5%, respectively. Finally, residents reported increased confidence in communicating with different members of the care team, from 42% to 61.5%, after adoption of monthly team meetings.

DISCUSSION/REFLECTION/LESSONS LEARNED: Our pilot curriculum demonstrated >20% improvement in confidence in EMR proficiency, team-based care, and communication after the first 6 months. Utilizing resident-developed, resident- led sessions at regular intervals provides resident training and empowerment with excellent patient care. In the future, we plan to formalize training to all residents, creating a culture of confidence and efficiency, and stewarding resident leaders in ambulatory care.

CONSCIOUS OBSERVATION AND ANALYSIS OF SUBCONSCIOUS THINKING (COAST): THE HARBINGER OF METACOGNITIVE APPROACH TO CLINICAL REASONING Fatima Shahid[1]; Hashim Abbas[1]; Mohammad G. Mohmand[2]; Neha Gupta[1]; Susan Vehar[1]; Mrinalini VenkataSubramani[1]; Megan McGervey[1]; Ali Mehdi[1]. [1]Cleveland Clinic Foundation, Cleveland, OH; [2]Cleveland Clinic Foundation, Beachwood, OH. (Control ID #2700618)

NEEDS AND OBJECTIVES: Clinical reasoning is the skill of using available information to come up with an accurate diagnosis and treatment strategy. Improving clinical reasoning among trainees is an ongoing challenge despite being integral in reducing diagnostic errors. We introduce an innovative approach where metacognition i.e. thinking about thinking is used to increase awareness of the subconscious thought processes and cognitive biases and hence improve clinical reasoning.

SETTING AND PARTICIPANTS: Our intervention consists of a biweekly conference for internal medicine residents in all levels of training. 25 residents attend each session and are subdivided into smaller groups.
DESCRIPTION: The COAST approach is grounded in transformative learning theory that refers to reshaping of perspectives through deep exploration of assumptions.We hope to instrument better diagnostic reasoning capacity and minimize cognitive errors through our approach. The conference proceeds as below: − A resident team member briefly highlights the clinical scenario. - Small groups discuss the case and identify an initial diagnosis. - "Thinking aloud", residents reflect on the thought processes behind the initial diagnosis and the cognitive biases involved. - Small groups then engage in further evaluation of the case by ordering diagnostic tests as needed until a final diagnosis is reached. - In a large group, residents "think aloud", explaining the rationale for the tests and diagnosis, and identify the cognitive biases that influenced the decision making.
EVALUATION: Qualitative data from resident reflections was collected. A survey questionnaire and two resident focus groups are planned to gain more insight into the points raised by the reflections. This data will be analyzed via thematic analysis.
DISCUSSION/REFLECTION/LESSONS LEARNED: Preliminary sampling of the data indicates successful transformational learning. This is important as there is no consensus regarding the nomenclature or the teaching strategy of clinical reasoning and there is a paucity of literature around this important construct in graduate medical education. Our interactive case based strategy introduces the concepts and lexicon of clinical reasoning into the world of residency. Noteworthy is that trained faculty with good facilitating skills, along with smaller groups are pre-requisites for the success of the conference.

CREATING A SUSTAINABLE INTERPROFESSIONAL AMBULATORY CARE TEAM TRAINING: ALL HANDS ON DECK Lisa Altshuler2; Nadiya Pavlishyn[2]; Elizabeth Saviola[4]; Anne Dembitzer[2]; Richard E. Greene[2]; Andrew B. Wallach[1]; Reina Smith[1]; Kelly J. Crotty[3]; Mark D. Schwartz[2]; Sondra Zabar[2]. [1]Bellevue Hospital, New York, NY; [2]NYU School of Medicine, New York, NY; [3]New York University, NY, NY; [4]Health and Hospitals Corporation, New York, NY. (Control ID #2704634)

NEEDS AND OBJECTIVES: Team-based primary care (PC) is seen as the best way to provide proactive, patient-centered quality care. However, developing these team-based skills is difficult in the ever-shifting, stressful healthcare environment. We sought to develop effective training to enhance team functioning at an urban safety-net hospital, with the goal of clinical transformation (e.g. improving clinic flow, enhancing care for patients with diabetes).
SETTING AND PARTICIPANTS: Team training intervention at Bellevue Hospital's Adult Ambulatory Care Center, flagship of the NYC Health & Hospitals (H + H), serving poor, diverse patients with complex medical and social needs. There are 4 adult PC teams, each with 8 attending physicians, 20 residents, 1–2 physician assistants, 2 nurses, 5 patient care associates (PCA), and 2 clerical associates (CA), all caring for a panel of ~7,500 patients. To date, we have completed a training cycle for one team, with 26 members: 10 providers (7 MDs, 2 PAs, and 1 NP), 4 RNs, 5 PCAs, 3 CAs, and 4 residents participating. We are scheduled to complete training of a second team in February 2017, with the other 2 to follow.
DESCRIPTION: We partnered with a parallel NYC H + H effort, enabling a seamless NYU-HRSA/NYC H + H program with increased time allotted. This includes 4 three-hour workshops co-led by NYC H + H and NYU-HRSA faculty. Each workshop blends activating, team-building exercises for teams; mini-lectures on topics like roles and responsibilities, communication skills, huddles, and experiential activities using the team's patient data. This is reinforced with seven, 30-min biweekly meetings to follow up on team-identified topics and facilitate team members' quality improvement projects.
EVALUATION: A 31-item (each item rated 0–3), retrospective pre/post survey was administered to trainees after training, addressing individual skills and attitudes (16 items) and team functioning (15 items). 14 of 26 participants (54%) in team 1 completed the survey, and Team 2 participants will complete the survey in Feb. 2017. Training resulted in increased rating of individual skills $t = 4.86$, $p < .0001$) and team functioning ($t = 4.02$, $p = .003$). Additional metrics, including tracking teams' QI efforts and assessing patient experience (e.g. Unannounced Standardized Patient reports) and administrative and panel level data, are ongoing.
DISCUSSION/REFLECTION/LESSONS LEARNED: Implementation of successful team training in an under-resourced, urban primary care setting is challenging. It demands flexibility, tailoring to participants' concerns; and responding to changing clinical and administrative circumstances. Essential to success was partnering with team members to guide the training.

CREATING DEBRIEFING SESSIONS FOR PERCEIVED MEDICAL ERRORS IN RESIDENCY: A STEP TOWARD WELLNESS Nancy Choi; Jenna McGoldrick; Scott Borgetti. University of Illinois at Chicago, Chicago, IL. (Control ID #2704653)

NEEDS AND OBJECTIVES: Needs: Formal setting to address perceived medical errors amongst residents Objectives of session include: **Recognize that having a perceived error OR grief from an error or loss can lead to depersonalization, depression, guilt, burnout and affect how you interact with patient +/− their family **Establishment of safe discussion space **Cultivate healthy and adaptive coping strategies
SETTING AND PARTICIPANTS: Participants include 9 residents per session, along with 2 co-facilitators including a chief resident and faculty attending.Three residents are selected (generally a resident on an outpatient, consult or research block that has not previously joined) from each PGY class. The setting is a small meeting room located on campus, done during the noon hour. Selected residents are excused from noon conference and receive credit for attendance.
DESCRIPTION: At our academic internal medicine residency previously, there had not been any formal setting to address perceived medical errors amongst residents, nor education on the emotional impact or coping strategies. Thus, as part of our (also new) Wellness Committee, debriefing sessions were created in an attempt to improve overall wellness amongst residents. We aimed to create a safe space and open discussion about perceived errors (avoiding root cause analysis approach), remove stigma from discussing it, share coping strategies,and provide available resources if further help is necessary (e.g., counseling services, psychiatric, etc.). These sessions occur each month. These sessions are also part of a Quality Improvement (QI) project (of chief resident and resident) with these aims: 1) To obtain baseline information regarding resident experience with medical errors/adverse outcomes and assess resident knowledge of coping strategies and resources. 2) To assess the utility of a debriefing session with fellow residents and chief/attending facilitator.

EVALUATION: As part of the QI component, one-page surveys were distributed before and after each session. Pre-surveys elicited resident experience with perceived errors, knowledge of coping strategies, and comfort level with discussion and coping.Questions in the post-survey elicited the utility of session and had the same scaled questions of comfort level of discussion and coping. At this time, only several sessions have occurred, so post-intervention analysis has not been thoroughly been studied yet. This will be done after 6 sessions. However, verbal feedback and preliminary review of the surveys show that these sessions are well-received and beneficial.

DISCUSSION/REFLECTION/LESSONS LEARNED: We recognize that burnout is prevalent both nationally and in our residency. While this is multifactorial, we also recognize that the intrinsic gravity of our work can be a source of stress and burnout. We reflected that medical errors (perceived or actual) or grief from patient outcome was rarely discussed. We are hopeful that creation of these sessions cultivate a safe space for discussion and education on how to better cope and ultimately improve wellness.

CREATING RICE (CRITICAL REFLECTION, INTERPROFESSIONAL EDUCATION, ADVANCED COMMUNICATION SKILLS AND ETHICS) - A CURRICULUM FOR CLINICAL MEDICAL STUDENTS TO ADDRESS THE HIDDEN CURRICULUM Amy Weil. UNC Chapel Hill School of Medicine, Chapel Hill NC, NC. (Control ID #2704264)

NEEDS AND OBJECTIVES: Needs: Concerned about rising burnout among students, Gold Humanism Honor Society (GHHS) inductees performed a service project analyzing themes from deidentified brief writings (Critical Incident Reports/CIRs) done annually by prior students. That session was designed to allow students to discuss areas of uncertainty harking back to topics from a preclinical course in Social Medicine with neutral Advisors. Predominant themes of CIRs included moral distress, lack of empathy, negative role models and communication difficulties. Objectives: GHHS Students urged UNC's curriculum committee to create safe space for students to reflect throughout the year on their clinical experiences, explore moral dilemmas and enhance communication and advocacy skills with patients, families and their teams in order to sustain their sense of purpose and wellness during clinical learning in addition to improving skills.

SETTING AND PARTICIPANTS: 130 clinical medical students return monthly to central campus to participate in a daylong course called Intensive Integration (II).

DESCRIPTION: After a 1 hour keynote experience students meet in small seminar groups co-led by a clinician and social science faculty for a 2 hour session called RICE (critical Reflection, Interprofessional Education, advanced Communication skills and Ethics) designed to enhance their experience as a clinician and team member. Students complete several reflection pieces and short descriptions of ethical dilemmas in advance of class and are invited to practice clinical skills (including shared decision making, motivational interviewing, delivery of and follow up of bad news, difficult conversations w patients, families and colleagues, public narrative) between sessions. Optional readings are offered to enhance discussions but case discussions and skill practice, creating smaller communities of support are priorities. Interprofessional peers joined our groups for museum based, interactive theater and online virtual patient care sessions. One hour preparation sessions are held with faculty after each session. Seminars in Population Health and Foundational Science are also offered during the II day.

EVALUATION: Students completed the Maslach Burnout Scale and Jefferson Empathy Scales prior to beginning their Application (clinical) year and will redo these in February 2017 at the completion of the year. We will compare pre and post results. In addition we will compile and report on course evaluations which have been collected 3 times during the year and run and report on a focus group.

DISCUSSION/REFLECTION/LESSONS LEARNED: Preliminary results suggest that students have benefitted from the RICE portion of the II course. Logistic challenges exist in creating and implementing a course at a central location during dispersed clinical learning but are manageable. Faculty are enthusiastic about teaching a course revealing and working on the hidden curriculum. We will integrate feedback from students and faculty to continue to improve the course.

CTRL-ALT-DELETE: RESETTING EHR TEACHING Veena Lingam[2]; Samita Mohanasundaram[1]; Dann Rocco[2]; Lillian Valdez[2]; Mathew Tharakan[2, 3]. [1]Stony Brook University, stony Brook, NY; [2]Stony Brook Univeristy, Stony Brook, NY; [3]Stony Brook University, Stony Brook, NY. (Control ID #2706198)

NEEDS AND OBJECTIVES: Despite widespread mandated use of Eelectronic Hhealth Rrecords (EHR), many residency programs struggle to find the best strategy to conduct EHR training. Traditional EHR training sessions are typically led by non-clinical IT staff and are often structured around software functionalities rather than clinical workflow. Furthermore, EHR training is not often customized to the needs of the different clinical specialty areas. The aim of this study is to create, implement and evaluate the effectiveness of a physician led; specialty focused EHR training through the use of clinical vignettes.

SETTING AND PARTICIPANTS: The study took place at Stony Brook University Hospital which is an academic and tertiary care center. Our participants included the incoming 146 residents and fellows for the academic year.

DESCRIPTION: A series of live EHR training sessions were offered to incoming interns and fellows from all departments during orientation. All participants were grouped according to clinical specialty; each group consisted of an average of 10–20 participants. All trainees were given a curriculum of online pre-training video modules to prepare for the live training sessions. The video modules were specially created to emphasize real-world workflow for each specialty and covered the core aspects of EHR use and highlighted common pitfalls. During the live training sessions, trainees were expected to conduct clinical demos with the utilization of a mock patient profile within the training domain of the EHR. Trainees were specifically supposed to complete a mock admission, medicine reconciliation a discharge process and order entry related to their clinical specialty area and workflow.

EVALUATION: All trainees completed a post training satisfaction survey at the end of the final training session.

DISCUSSION/REFLECTION/LESSONS LEARNED: A total of 206 trainees participated in the study. We surveyed a total of 146 residents and fellows who went through the training completed the survey (response rate of 70%). 77% of the participants strongly agreed' or 'agreed' that the EHR workflow based vignettes were effective in enhancing their training. Our study suggests that EHR training should minimize computer based, passive didactic on software functionalities and focus on case-based clinical vignettes that are tailored to each clinical subspecialty area to accommodate the different types of

workflow. An EHR training model centered on a specialty based workflow approach can be used as an important training technique to teach residents core principles of EHR use.

DESIGN AND IMPLEMENTATION OF A WELLNESS CURRICULUM FOR INTERNAL MEDICINE RESIDENTS Sarah Rimar[2]; Rupel Dedhia[1]. [1]Rush University Med Center, Chicago, IL; [2]Rush University Medical Center, Chicago, IL. (Control ID #2697198)

NEEDS AND OBJECTIVES: The burnout rate among medical residents has reached an all-time high. This poses dire consequences to patient care, safety, and the health care system as a whole. The American College of Graduate Medical Education has become increasingly aware of this problem, but research on the efficacy of existing interventions is limited. The internal medicine program at Rush University Medical Center has lost multiple residents to suicide within the last decade. These events have ignited a mission within the residency program to incorporate wellness into the curriculum. July 2016 marked the beginning of an intern wellness pilot program. The objective of this program was to develop a community where interns feel engaged and empowered while exploring tools designed to build resiliency skills.

SETTING AND PARTICIPANTS: Eleven interns self-selected to participate in the yearlong curriculum composed of monthly small group sessions. Once the group began, no additional interns were allowed to join. To ensure a safe environment, the group members were asked to keep information shared by any group member in confidence at all times.

DESCRIPTION: Each session was one-hour in length and occurred during lunch on days when noon conference was cancelled, which guaranteed that attendees did not miss any educational material. Senior residents were asked to hold the intern pagers during these sessions to allow for uninterrupted participation. A chief resident and an internal medicine attending, both trained by the Center for Mind Body Medicine, led each session.

EVALUATION: At the end of each session, participants were given a brief anonymous survey. All data from these surveys have been compiled and averaged to date. The first question asked whether the session helped them gain new insights into residency experiences thus far; 89 percent responded yes. The second question asked whether the session helped them recognize and address personal or psychological issues affecting professional performance; 95 percent responded yes. Lastly, they were asked to rate each session as outstanding, good, fair, or poor. 75 percent found the sessions to be outstanding, and the rest rated as good.

DISCUSSION/REFLECTION/LESSONS LEARNED: Although a small sample size, our results suggest that our interns have benefit from small-group wellness-focused initiatives. Despite the overall positive evaluations thus far, the implementation of the intern wellness program has met challenges. First, scheduling issues and patient emergencies prohibited interns from attending some sessions. Even when interns were present, they were often carrying pagers and dealing with work-related matters during the sessions. Interns were reluctant to ask their seniors to cover their pagers, in part due to concern that some seniors did not understand the purpose of the wellness sessions. These are a few of the many barriers to designing a wellness curriculum at the graduate medical education level. Review of the literature suggests that these interventions may meet fewer challenges at a medical school level.

DEVELOPING A HUMANISTIC TOOLKIT FOR AN INTERPROFESSIONAL TRAINING PROGRAM Carole Warde[1]; Michael Soh[1]; Andrew Shaner[2]; Emilie Sohl[1]; Meredith Magner-Perlin[2]; Lillian Gelberg[2]. [1]Greater Los Angeles VA Health System, North Hills, CA; [2]Greater Los Angeles VA Health System, Los Angeles, CA. (Control ID #2706993)

NEEDS AND OBJECTIVES: Delivering *team-based* humanistic care to a *complex and marginalized population* requires a shift in how humanism is learned, taught, and acculturated. Because teaching humanism is challenging to implement for interprofessional (IP) teams, the Humanism Pocket Tool' (HPT) was designed to provide trainees and faculty with a standardized and translatable curriculum for IP collaboration. The HPT includes tools not only aimed at increasing humanistic behaviors *but* minimizing de-humanizing responses such as contempt, disgust, fear, and anger. We describe the HPT, how we developed it, and lessons learned.

SETTING AND PARTICIPANTS: The practice/training site is in a large VA clinic for homeless Veterans, organized as a PCMH. The clinic provides primary and mental health care, housing, and psychosocial resources. In July 2016, trainees began the program with trainees from 5 health professions disciplines. The HPT was developed during weekly IP leadership meetings and in conjunction with a consulting faculty member with expertise in the evolution of human emotion.

DESCRIPTION: The HPT emphasizes explicit techniques pulled from the realms of appreciative inquiry, storytelling, active listening, and mindfulness. The HPT comprises seven tools for use with patients and colleagues: 1) self-talk, 2) active listening, 3) physical touch, 4) vivid vignettes, and 5) checking-in. Self-talk describes the phrases said to oneself to enter a humanistic frame of mind. Active listening refers to open-ended interviewing centered on minimal encouragements to continue talking, open-ended questions, restatements, and empathic remarks. Physical touch entails the use of touch with a patient in safe, appropriate, and authentic contexts. Vivid vignettes explore a patient's aspirations and obstacles in an effort to better understand their background, and enable practitioners to refer to patients in a humanizing way in progress notes and IP discussions. And lastly, checking-in with colleagues hones in on getting to know the IP team as people and developing a level of trust needed for humanistic patient care.

EVALUATION: We initiated a pilot assessment of the HPT using a checklist designed for faculty and trainees. We assessed how, when, and where HPT teaching/learning takes place and how we can better assess the impact of the HPT on patient care. The checklist entails both quantitative and qualitative features. Future assessments will include faculty/trainee observations, interviews and focus groups, and patient experience surveys.

DISCUSSION/REFLECTION/LESSONS LEARNED: The development of the HPT has been a collaborative and interdisciplinary effort. We learned that the robustness of the HPT was a result of engagement of the leadership within our IP framework. This allowed for open and safe communication, sharing of ideas and existing best practices from various disciplines, and constructive feedback. This dynamic input from the IP team evolved the HPT into a tool exemplifying the humanism needed to thrive in our team-based patient care model.

DEVELOPMENT AND IMPLEMENTATION OF A CURRICULUM FOR INTERNAL MEDICINE RESIDENTS IN OPTIMAL PRIMARY CARE OF PATIENTS WHO IDENTIFY AS LESBIAN, BISEXUAL, GAY OR TRANSGENDER Eloho Ufomata[2]; Kristen Eckstrand[3]; Peggy B. Hasley[1];

Kwonho Jeong[1]; Doris Rubio[1]; Carla Spagnoletti[1]. [1]University of Pittsburgh, Pittsburgh, PA; [2]University of Pittsburgh Medical Center, Pittsburgh, PA; [3]Western Psychiatric Institute and Clinic, Pittsburgh, PA. (Control ID #2701966)

NEEDS AND OBJECTIVES: There is a paucity of curricula specific to lesbian, gay, bisexual and transgender (LGBT) care. A survey of all 176 medical schools in the US and Canada found that only 24.2% had discrete modules to teach LGBT-related content. In our Internal Medicine (IM) residency, 70% of residents and 90% of faculty reported having less than 2 hours of LGBT curricular content. No research has evaluated LGBT content education in IM residencies, however the American College of Physicians recommends that residency programs should incorporate LGBT health in their curricula. Our goal was to create a comprehensive LGBT curriculum for IM residents with the objective of improving faculty and residents' knowledge and attitudes of LGBT primary care.

SETTING AND PARTICIPANTS: Participants were 153 residents at an IM residency program, and 35 faculty preceptors. The curriculum was mandatory and part of the "pre-clinic" ambulatory conference. Structurally, it was divided into four 45-min sessions on LGBT topics in a case-based interactive small group discussion format.

DESCRIPTION: The curriculum, informed by the AAMC publication on educational competencies in LGBT care and the Fenway Guide, was developed by a group of IM residents, an associate program director for ambulatory training, and an expert on LGBT health. It was piloted by a group of IM education fellows for ease of teaching and content. The four sessions were gender and sexuality framework; cultural competency with sensitive history taking/physical exam; health promotion and disease prevention; and mental health and societal factors.

EVALUATION: Pre- and post-surveys assessed knowledge with multiple choice questions, and attitudes with 5 point Likert-type scales. The response rate on the pre-survey was 65% for residents and 78% for faculty, with 33 and 52% completing at least ¼ post surveys. Residents felt that LGBT topics were important at baseline and after the curriculum (pre-mean 3.98 ± 0.93, post-mean 4.17 ± 0.80; $p = 0.079$). Resident confidence increased significantly in ability to provide resources for community engagement; discuss unique health risks; institute gender affirming practices in clinic; discuss safe sex practices with women who have sex with women; and briefly discuss options for biologic parenthood (all $p < 0.05$). Faculty felt the materials prepared them to teach (mean 4.36 ± 0.45) and residents agreed that the faculty were prepared and knowledgeable (mean 4.27 ± 0.68). A majority, 83.8% of residents and 93.3% of faculty, felt that the curriculum increased their understanding of the challenges faced by patients who identify as LGBT when interacting with the healthcare system.

DISCUSSION/REFLECTION/LESSONS LEARNED: This curriculum pilot was successful in increasing knowledge and confidence for LGBT related topics among residents. It was easily taught by faculty with little to no prior experience in LGBT-specific education. Since the curriculum covers a broad range of topics salient to the care of LGBT patients, it has potential to be utilized by a broader audience of medical providers.

DEVELOPMENT OF A CURRICULUM IN INTERPROFESSIONAL TEAM WORK FOR PRIMARY CARE AND MENTAL HEALTH TRAINEES IN A VA HOMELESS PATIENT CENTERED MEDICAL HOME Carole Warde[1]; Kerri Schutz[2]; Shinobu Seragaki[2]; Elise Hulsebos[1]. [1]Greater Los Angeles VA Health System, North Hills, CA; [2]Greater Los Angeles VA Health System, Los Angeles, CA. (Control ID #2706463)

NEEDS AND OBJECTIVES: A well-functioning interprofessional (IP) team is essential in a patient-centered medical home (PCMH). Training PCMH teams together improves their teamwork. Studies suggest that homeless patients with complex medical and mental health care needs, benefit from a team of integrated primary care and mental health professionals. We felt that IP team training had to be adapted to these special circumstances. We developed an IP teamwork (IPTW) curriculum including competencies and practice-based learning experiences.

SETTING AND PARTICIPANTS: The West Los Angeles VA Homeless Clinic is a PCMH that provides primary and specialty mental health care, housing, and psychosocial resources. In July 2016, trainees from 5 disciplines began a new IP training program in this clinic. The trainees function as a distinct team embedded in an existing team of faculty clinicians. In October 2015, the clinical faculty began planning an IPTW curriculum.

DESCRIPTION: We adapted three conceptual frameworks to guide our work: teamwork in a PCMH, curriculum development, and educational evaluation. To develop the curriculum, faculty participated in 3 retreats and weekly 2-hour meetings. An IPTW committee met every other week and guided curriculum development activities. Following a literature review and concensus process, the faculty identified competencies in 3 domains: Task Work, Team Communication, and Team Processes. Next, we identified 8 relevant learning experiences and evaluation methods for each competency. A continuous process of reflection and improvement by faculty and trainees is being used to continually refine the curriculum and make it clinically relevant.

EVALUATION: We will evaluate TW reactions, knowledge, behaviors and outcomes. Utility and effectiveness of each session will be assessed after each sessions. Trainee attitudes toward teamwork will be evaluated using qualitative and quantitative measures at the beginning and end of year 1. Trainee teamwork skills and care outcomes will be measured at 6 and 12 months, using previously validated measures. For IPTW behaviors, we will use a 360-degree assessment and a checklist of relevant team communication behaviors. Team care outcomes to be measured include: patient experience, team function, quality of care measures, team practice culture and worklife measures.

DISCUSSION/REFLECTION/LESSONS LEARNED: Reflection by faculty on their own teamwork practices has been key to building our curriculum. As we worked together, our relationships deepened, we became more honest in our communication, and more creative in our curriculum development work. The process took much longer than we had anticipated due to the number of faculty and trainees involved. Since the trainees are together most often during patient care hours, we developed learning activities that were primarily practice based and reflective. Explicit modeling of the respectful relationships between faculty members, other teams, and leadership is critical to teaching effective team function.

DEVELOPMENT OF A NATIONAL PERIOPERATIVE MEDICINE CURRICULUM: RESULTS FROM A MULTICENTER WORK GROUP FROM LEADERS IN PERIOPERATIVE MEDICINE. michele fang[5]; Avital O'Glasser[2]; Sunil K. Sahai[6]; Kay Johnson[4]; Kurt J. Pfeifer[1]; Ethan Kuperman[3]. [1]Medical College of Wisconsin, Milwaukee, WI; [2]OHSU, Portland, OR; [3]University of Iowa Carver College of

Medicine, Iowa City, IA; [4]VA Puget Sound Health Care System, Seattle, WA; [5]university of pennsylvania, Wynnewood, PA; [6]MD Anderson, Houston, TX. (Control ID #2706582)

NEEDS AND OBJECTIVES: The Accreditation Council for Graduate Medical Education (ACGME) and Alliance for Academic Internal Medicine have defined competencies for internal medicine residents. Two of these competencies focus on perioperative medicine: (1) Provide perioperative assessment and care and (2) Provide general internal medicine consultation to nonmedical specialties. Despite this, there are no standard curricula or assessment tools to teach and assess resident competence in perioperative medicine.

SETTING AND PARTICIPANTS: Leaders in perioperative medicine from 6 large, academic US health centers developed core objectives and a standard curriculum to teach perioperative medicine to internal medicine residents. Leaders independently submitted their thoughts on core objectives, core learning modules, pre-test and post-test questions. Finalized objectives, modules and test questions were determined by consensus.

DESCRIPTION: The Society for Hospital Medicine provided the foundation of the curriculum, based on open-access to SHMConsults.com self-study modules that were evidence-based and peer-reviewed. Core objectives and modules included: application of basic principles of perioperative medication management, assessment and optimization of preoperative cardiac risk and pulmonary risk, risk stratification of venous thromboembolism risk in surgical patients, perioperative management of diabetes mellitus and common postoperative problems (e.g. fever).

EVALUATION: Assessment of perioperative medicine knowledge is based on the resident demonstrating competence in the 9 objectives and predefined curricular milestones in patient care, medical knowledge, practice-based learning and improvement, interpersonal and communication skills, professionalism, and systems based practice. Residents are evaluated by direct observation, chart audit, and written examination with a standardized post-test, CEX of preoperative evaluation, and feedback on written consults. Residents and faculty implementing the curriculum provide feedback via an anonymous post-rotation survey.

DISCUSSION/REFLECTION/LESSONS LEARNED: It was relatively easy to have consensus on core objectives, modules, and test questions. It will be harder to implement the curriculum without buy-in from the residency program on the importance of perioperative medicine to their residents.

DEVELOPMENT OF A NOVEL SKILLS-BASED RESIDENT CURRICULUM TO REDUCE BURNOUT

Jacob Mirsky[2]; Michelle L. Dossett[3]; Barbara Gottlieb[1]; Darshan Mehta[3]. [1]Brigham and Women's Hospital, Jamaica Plain, MA; [2]Brigham and Women's Hospital, Brookline, MA; [3]Massachusetts General Hospital, Boston, MA. (Control ID #2703779)

NEEDS AND OBJECTIVES: Depression and burnout among residents and physicians leads to medical errors, motor vehicle accidents, and suicides. Despite increased attention to these issues, few programs have implemented and studied new initiatives focused on resident education. Therefore, we conducted a needs assessment regarding resident wellness and studied the feasibility of a novel skills-based curriculum addressing burnout.

SETTING AND PARTICIPANTS: Interns, junior residents, and senior residents in the Brigham and Women's Hospital Internal Medicine Residency Program

DESCRIPTION: Based on a needs assessment of residents, we developed a skills-based wellness curriculum highlighting the literature supporting healthy behaviors and providing experiential education focused on fostering healthy behaviors in residency. The curriculum consisted of three independent one-hour sessions on mindfulness meditation, yoga, and healthy eating. Each session was led by a faculty leader and a resident interested in medical education; the sessions took place during dedicated noon-time teaching conferences for all internal medicine residents.

EVALUATION: Residents completed an initial survey via e-mail with the goals of 1) identifying the early-year prevalence of burnout and depressive symptoms, 2) characterizing the frequency of healthy behavior practices among residents, and 3) conducting a needs assessment for the skills-based curriculum to follow. Validated instruments for burnout (Maslach Burnout Inventory) and depression and anxiety (PHQ-4) were used. In addition, residents completed a previously published 16-item survey of healthy behaviors. At the end of each curricular session, residents provided quantitative feedback using standard effectiveness scales to rate the learning experience, as well as free-text opportunities to give qualitative feedback. Participation in the study was voluntary and anonymous, and participation in the study was not required for participation in the skills training sessions. The study was exempt from IRB review.

DISCUSSION/REFLECTION/LESSONS LEARNED: Approximately 50% of residents endorsed psychological distress, and free-text responses brought to life the mental and emotional challenges of residency. Many residents supported our efforts to increase healthy behaviors. The skills-based wellness sessions were both feasible and widely appreciated by residents.

DEVELOPMENT OF AN ADVANCED COMMUNICATION AND INTERVIEWING CURRICULUM FOR INTERNAL MEDICINE RESIDENTS

Mark J. Simone[1, 2]; Pat Moyer[1, 2]; Beth A. Lown[1, 2]. [1]Mount Auburn Hospital, Cambridge, MA; [2]Harvard Medical School, Boston, MA. (Control ID #2706538)

NEEDS AND OBJECTIVES: Internal medicine residents require advanced training in patient-centered communication in order to facilitate understanding of the patient as a person and support patients' understanding of health-related information. The purpose of this educational research project is to assess whether a targeted communication skills program will improve residents' skills with communication in actual clinic-based interactions.

SETTING AND PARTICIPANTS: Internal medicine residents participated in this curriculum during their 4-week Ambulatory Rotation during each year of residency.

DESCRIPTION: We developed a formal communications curriculum that includes learner-centered online modules, direct observation of interview skills, and timely formative feedback, as outlined below: 1. Resident identifies two skills to work on in clinic during the Ambulatory Rotation based on feedback from communications MiniCEX by continuity clinic preceptor 2. Resident completes two educational modules based on those two skills 3. With patient consent, the resident records a patient interview in continuity clinic

demonstrating their learned skills 4. Resident completes two self-reflection worksheets that correspond to the educational modules 5. Each resident takes a turn during the 4 weeks of Ambulatory Conference to share their video with 2 faculty and the 4–6 peers also on Ambulatory Rotation. The group provides feedback, and the faculty complete a second MiniCEX based on their observations of the video.

EVALUATION: Residents completed self-reflection worksheets and end-of-rotation surveys. Data is presented from the 38 residents (47 sessions) who provided consent to participate in the study. At the end of the rotation, when asked to rate confidence in using the communication skills discussed in this curriculum, 100% reported feeling moderately to very confident (62 and 38%, respectively) When asked to rate change in ability to use the skills, 100% reported moderate to significant improvement (72 and 28%, respectively). 29 residents turned in the self-reflections worksheets, and when asked to report how well they did accomplishing the behaviors and implementing the skills, on a scale of 1–5, residents reported an average of 3.3 for both ($n = 29$). Rotation evaluation comments are overall quite positive.

DISCUSSION/REFLECTION/LESSONS LEARNED: Residents report improved confidence and ability to use advanced communication skills after participation in a novel curriculum.

DISCHARGE SUMMARY WORKSHOP FOR FOURTH YEAR MEDICAL STUDENTS Marianne Bauer1; Radha Govindraj[1]; Ryan Chippendale[2, 1]. [1]Boston Medical Center, Boston, MA; [2]Boston University, Boston, MA. (Control ID #2706975)

NEEDS AND OBJECTIVES: Sub-optimal transitions of care can lead to patient harm and system inefficiencies in a variety of ways including medication discrepancies, inadequate communication of outstanding issues, and unnecessary repeat testing. Although warm handoffs are preferred, there are many barriers to achieving this in the current medical system making discharge summaries essential documents. A needs assessment survey of 26 Internal Medicine (IM) interns was conducted in August 2015 to guide curriculum development. Only 1 intern reported receiving formal discharge summary training prior to residency while 15 (58%) interns reported a desire for formal training. Given the identified curricular gap, an interactive workshop was developed to train 4th year medical students in using discharge summaries as an effective means of communication.

SETTING AND PARTICIPANTS: An hour-long interactive workshop was incorporated into Boston University School of Medicine's Advanced IM fourth year medical student clerkship. The workshop was given once per rotation for a total of 7 sessions (approximately 8 students per session). 4 of the sessions were at the beginning of the 4th year ($n = 29$ students, the majority of whom had not completed a subinternship) while 3 of the sessions ($n = 26$ students) were at the end of the year.

DESCRIPTION: The workshop begins with a case followed by a facilitated discussion on the essential components of discharge summaries. Students are then divided into small groups to analyze a sub-optimally written discharge summary. Subsequently, the facilitator leads a large group debrief and students systematically critique the discharge summary.

EVALUATION: A study key linked, paper-based survey was administered at the start (pre) and end (post) of the workshop. Using the McNemar's test, a statistically significant number of participants reported a shift (from pre to post testing) to "completely confident" with regards to their ability to write a succinct and effective discharge summary ($p = 0.005$) and in their ability to use a discharge summary to communicate outstanding issues ($p = 0.002$). Additionally, there was a statistically significant increase in perceived importance of receiving formal training on discharge summaries during medical school when pre-post cohort data was analyzed using the Wilcoxon Signed-Rank test ($p = 0.006$).

DISCUSSION/REFLECTION/LESSONS LEARNED: Based on the needs assessment survey, a lack of standardized instruction on writing effective discharge summaries was identified in current medical school curricula. The students responded well to an interactive workshop as a method to teach essential aspects of discharge summaries as evidenced by an increase in self-reported confidence levels. Given the critical nature of this document, medical students should be taught how to write accurate and efficient discharge summaries prior to entering residency.

DOCTOR KNOW THYSELF: IMPROVING PATIENT COMMUNICATION THROUGH MODELING AND SELF-ANALYSIS Kathleen G. Anderson; Michelle Milic. Medstar Georgetown University Hospital, Washington, DC. (Control ID #2706196)

NEEDS AND OBJECTIVES: Communication is a core clinical competency integral to building trusting patient-physician relationships and improving patient outcomes. Most communication education is at bedside, through observation of model physicians. Yet to solidify observation into clinical skill, learners must formally analyze what they have seen - an essential piece often missing in training programs. We present a novel communication intervention that focuses on critical analysis of model physicians as a tool for teaching self-reflection skills. The primary objective is to improve medical trainees' self-awareness of their verbal and non-verbal communication skills. The secondary objective is to train physicians to thoughtfully use these skills to build the patient-physician relationship.

SETTING AND PARTICIPANTS: Participants are medical students and internal medicine residents at Georgetown University Hospital on the Palliative Care rotation. Attending physicians chosen as models are critical care physicians and hospitalists.

DESCRIPTION: Our curriculum is a one hour small group session. First, trainees analyze a respected attending's communication techniques, specifically focusing on how they convey competence and patient-centeredness. Learners reflect on eloquence, poise, tone, pace, and body language - and how models use their individuality to best effect. These observations are a template for non-judgmental self-analysis of their own personal approach. They create strength-focused written analyses which are shared with the attending physician and, with permission, their supervisor.

EVALUATION: We are prospectively evaluating the efficacy of this intervention with quantitative and qualitative methods via learner survey at 1 and 3 months post intervention. Assessments include changes in awareness of personal communication techniques, behavior change, and insights gained. We also capture responses from model physicians assessing reaction to reports and changes in use of bedside teaching opportunities.

DISCUSSION/REFLECTION/LESSONS LEARNED: Trainees find this intervention has improved self-awareness and been an opportunity to share their own strengths in a safe, positive, and constructive forum. Attendings have become more conscious of trainees' perceptions of their skills. We propose that by raising awareness of modeling behavior, teaching

physicians may harness previously missed teaching opportunities and modify their own approach. Our method is easily replicated in other institutions by physicians or non-physicians trained in communication with learners of any level who have experience in patient care and a developing voice. In addition, sharing the analyses with model physicians promotes a culture of 360 degree learning and collegiality. The written analyses can aid trainee evaluation and board recertification.

EDUCATING AND ENCOURAGING MEDICAL RESIDENTS TO ADDRESS ADVANCED CARE PLANNING IN A PRIMARY CARE SETTING

Debbie J. Goodman; Heather Viola; Krishna A. Chokshi; Farid Gholitabar; Joseph Sassine; Wen Zhang; Shawn Lee; Ashish Correa; Timothy Mathews; Dipal R. Patel; Tamara Goldberg. Mount Sinai St. Luke's-West, New York, NY. (Control ID #2704787)

NEEDS AND OBJECTIVES: Advanced care planning has become increasingly important given our aging population. Although 90% of adults would prefer doctors to discuss end of life care, only 27% of those aged 65 and older have had such discussions[2] . Unfortunately, medical residents often feel unprepared to approach these discussions, as fewer than 18% of students and residents have received any formal end-of-life care education[1]. To address this, we aimed to assess resident attitude and knowledge about advanced care directives in the outpatient setting before and after administration of a brief educational handout.

SETTING AND PARTICIPANTS: 50 Internal Medicine residents in an urban primary care clinic.

DESCRIPTION: A four question survey, assessing knowledge of advanced directives was issued to residents. Then, focused educational material was dispersed to the residents, and one month later, a post-survey was issued to the same residents.

EVALUATION: A total of 21 residents completed the survey. At baseline, 62% of residents had never initiated a goals of care discussion in the clinic. After the intervention, 90% of residents felt more confident discussing advanced directives and 90% of residents responding to the post-test survey could distinguish the difference between a health care proxy, a living will, a surrogate, and a power of attorney, compared to 52% of residents in the pre-test survey. Post-intervention, 95% of residents could describe the terms of a "Medical Orders for Life-Sustaining Treatment" form. In addition, 100% of post-test respondents knew that a patient could change their advanced directive at any point in time compared to 52% pre-intervention.

DISCUSSION/REFLECTION/LESSONS LEARNED: With an increasingly aging population, goals of care discussions have become integral to medical practice. Our survey data support the idea that succinct educational material can address a knowledge deficit among residents and lead to improved confidence in having goals of care discussions. As a result, residents will be more prepared to engage in advanced care discussions.

EDUCATING RESIDENT PHYSICIANS: IMPLEMENTING AND EVALUATING A BEHAVIORAL MEDICINE PROGRAM IN INTERNAL MEDICINE

Jennifer Harsh; Tyler Lawrence. University of Nebraska Medical Center, Omaha, NE. (Control ID #2702020)

NEEDS AND OBJECTIVES: Psychosocial problems are commonly seen in primary care, result in higher medical cost, and the prevalence of patients with these problems is expected to increase. Internal medicine does not have a requirement for integrating behavioral medicine education into resident training. This may be contributing to gaps in resident psychosocial knowledge and skills. One way to fill this gap is to implement a behavioral medicine education program during residency. Aims: 1. Outline an approach to implementing and modifying a behavioral medicine education program for internal medicine residents. 2. Describe evidence supporting the benefits of including behavioral medicine education in an internal medicine residency.

SETTING AND PARTICIPANTS: The participants for this study were 1st, 2nd, and 3rd year internal medicine residents who attended behavioral medicine video review seminars and behavioral medicine didactic noon conferences.

DESCRIPTION: Residents participated in hour-long behavioral medicine noon conferences, monthly, in which they learned about psychosocial aspects of patient care and best practices for enhancing the quality of patient-provider interactions. Residents also participated in behavioral medicine seminars, twice yearly, in which two to three residents joined behavioral medicine faculty to view video recorded patient encounters that residents deemed "difficult", due to either psychosocial patient complaints and/or difficulties in establishing an optimal patient-provider relationship. To evaluate the impact of the curriculum, we developed a method for assessing curriculum utility as well as determining which psychosocial skills residents perceived as most beneficial and which skills residents would still like to learn.

EVALUATION: Following each component of the behaivoral medicine curriculum, both noon conferences and seminars residents were asked to complete a brief survey. Surveys were designed to provide a basis for understanding the strengths of the noon conferences and seminars and areas that needed improvement to better meet residents' needs and contained three open ended questions and one Likert scale response. Researchers utilized thematic analysis to study responses from open-ended survey questions. Data were coded and subsequently themes and sub-themes were developed, based on these codes. Descriptive statistics were used to analyze the frequency of themes and sub themes in addition to Likert scale response scores.

DISCUSSION/REFLECTION/LESSONS LEARNED: Residents valued the knowledge and skills learned through the noon conference and behavioral medicine seminars, and reported that each of these components were useful. Strategies for enhacing patient-provier communcation, facilitating difficult interactions, goal setting, structing the encounter, and self-care were mentioned as particularly useful topics for their practice. Resident feedback suggests expanding behavioral medicine curriculum to include patient motivation enhancement, engaging patient social support, and mental health assessment would be beneficial.

EFFECT OF CLINIC SETTING ON RESIDENT PERCEPTION OF QUALITY, JOB SATISFACTION, AND CAREER CHOICE

Matthew H. Zegarek2, 1; Yogesh Khanal[2]; Theodore Long[2]; Frank Buono[1]; Brent A. Moore[3]; Rebecca Brienza[1]. [1]VA Connecticut Healthcare System, West Haven, CT; [2]Yale University School of Medicine, West Haven, CT; [3]Yale University School of Medicine, New Haven, CT. (Control ID #2689345)

NEEDS AND OBJECTIVES: There is a significant shortage of primary care providers in the U.S. One proposed explanation for this is that negative

experiences in residency clinics discourage internal medicine residents from choosing to practice primary care. Our goal was to test this hypothesis by surveying residents in different clinic settings on their perception of their clinic's quality of care, their job satisfaction, and career choice.

SETTING AND PARTICIPANTS: Surveyed residents worked in multiple clinic setting, including (1) the West Haven VA Connecticut Healthcare system primary care clinic, in which care is delivered in a patient centered medical home model, (2) the Center of Excellence in Primary Care Education (COEPCE) at the West Haven VA, in which internal medicine residents work and learn in interprofessional teams, and (3) various other Yale-affiliated primary care clinics that serve an urban, generally underserved population. Residents in the COEPCE participate in additional curricula, including such topics as shared decision making, interprofessionalism, and quality improvement.

DESCRIPTION: A survey was sent out to all Yale Internal Medicine residents in 2015. Residents rated their clinic on the characteristics of a patient centered medical home (PCMH) as defined by the National Committee for Quality Assurance. Additional survey questions evaluated their perception of their clinic's teamwork, collaboration, and quality of patient care, and their own sense of job satisfaction, burnout, and planned career choice.

EVALUATION: Residents in the COEPCE clinic reported they were significantly more likely to choose primary care as a career than residents in other clinics ($p = 0.01$). Residents in the COEPCE and non-VA clinics were more likely to report that their clinic had a significant impact on their career choice ($p = 0.01$). However, residents in the COEPCE clinic rated their clinic lower in PCMH domains, and reported lower sense of control, teamwork, collaboration, quality of patient care, job satisfaction, and higher burnout than other residents.

DISCUSSION/REFLECTION/LESSONS LEARNED: It was surprising that COEPCE residents reported greater likelihood to pursue primary care and a greater effect of their clinic experience on their career choice, but rated their clinic lower on PCMH domains and on their own job satisfaction. One explanation we propose is that residents in the COEPCE are exposed to additional curriculum on optimal and innovative primary care practices, and are consequently more critical when evaluating their clinic on PCMH domains.

EFFECTS OF A COMPREHENSIVE WELLNESS PROGRAM ON MEDICINE RESIDENT BURNOUT Carol Faulk; Vinaya Mulkareddy; Amit Bery; Raymond Fohtung; Joshua Saef; Catherine McCarthy; Niall Prendergast; Jacqueline Chen; Andrew Michelson; Rakhee Bhayani. Washington University in St Louis, St Louis, MO. (Control ID #2705879)

NEEDS AND OBJECTIVES: The prevalence of physician burnout among internal medicine residents ranges from 50%-75 and is associated with poorer patient care and higher rates of depression and substance abuse. Both the Accreditation Council for Graduate Medical Education and the American Medical Association have declared this to be a national issue. To combat growing rates of burnout, residencies have implemented various wellness curricula. Most interventions, however, have been studied in isolation. The effects of a comprehensive, multi-faceted program have not been extensively evaluated. The present study was designed to assess the impact of a comprehensive wellness program on resident physician well-being in a large academic hospital.

SETTING AND PARTICIPANTS: At the start of the 2016–2017 academic year, a new wellness program was integrated within the Washington University in St Louis internal medicine residency curriculum at Barnes Jewish Hospital. 142 internal medicine residents at all training levels participated in this curriculum.

DESCRIPTION: A wellness committee, comprised of faculty, chief residents, and resident representatives, was established. Curricula were created for large-group lectures, small-group workshops and team building exercises. Required large-group lectures taught evidence-based cognitive behavioral therapy (CBT) techniques to help residents during times of stress. Small-group sessions were designed to cover a selection of wellness-related topics, including imposter syndrome, defining success, and maintaining compassion. All small group didactics occur during protected time on inpatient rotations and are facilitated by licensed clinical psychologists. Team-building exercises include both organized social outings for the entire residency, as well as monthly competitions between inpatient teams, with awarded group prizes.

EVALUATION: Resident-physician burnout prevalence was assessed at the start of the 2016–2017 academic year using the Maslach Burnout Inventory on a voluntary basis. Final analysis of this initial survey is currently pending. Small-group sessions were anonymously evaluated by participants through a standardized form after each session. We will survey residents using the Maslach Burnout Inventory again at the end of the academic year to look for improvement in burnout prevalence.

DISCUSSION/REFLECTION/LESSONS LEARNED: Burnout is defined as a combination of depersonalization, emotional exhaustion and decreased perceived accomplishment. Trials have shown CBT techniques can reduce compassion fatigue and enhance resilience, while small-group and team-building exercises can increase perceived compensation and accomplishment. By employing modalities to address each element of physician burnout, it is expected that this comprehensive wellness program will improve resident wellbeing.

EFFICACY AND IMPACT OF AN LGBT HEALTH ELECTIVE FOR FIRST- AND SECOND-YEAR MEDICAL STUDENTS Erica Martinez[2]; Thien Le[2]; Louis Fitch[2]; Matthew Minturn[2]; Rita Lee[1]. [1]University of Colorado, Aurora, CO; [2]University of Colorado Denver, Aurora, CO. (Control ID #2706159)

NEEDS AND OBJECTIVES: An ever-growing body of research conducted over the past decade or more suggests that individuals who identify as lesbian, gay, bisexual, or transgender (LGBT) face significant health disparities. Despite growing awareness, most medical students receive very little exposure to the special health needs of LGBT individuals or to the barriers that these individuals face in accessing care.

SETTING AND PARTICIPANTS: We implemented a 10-hour LGBT health elective for first- and second-year medical students at the University of Colorado.

DESCRIPTION: The elective consists of five 2-hour sessions that included: LGBT-related terminology and communication skills; health issues and preventive care for LGBT youth and adults; panel discussion with members of the LGBT community; and a practice session with standardized patients.

EVALUATION: Course participants completed global pre- and post-course surveys to assess prior experience in working with this population, self-confidence in caring for this population, and knowledge of LGBT health issues. Responses were summarized using descriptive statistics. Paired Student's t-tests were used to assess pre- and post-course performance.

DISCUSSION/REFLECTION/LESSONS LEARNED: To date, two cohorts of students have completed the course ($n = 28$ students). Students demonstrated an increase in comfort eliciting information about sexual behavior from pre-course (55%) to post-course (96%; $p < 0.001$) and sex anatomy and gender identity (32% to 100%; $p < 0.001$). Students also reported an increase in ability to articulate the special health needs of lesbian, gay, and bisexual (LGB) patients (24% to 100%; $p < 0.001$) and of transgender patients (10% to 100%; $p < 0.001$), to summarize primary care recommendations for LGB patients (21% to 100%; $p < 0.001$) and for transgender patients (from 3% to 100%; $p < 0.001$), to identify resources in the community for LGBT patients (from 24% to 96%; $p < 0.001$). Knowledge of LGBT health issues increased during the course—from 42% correct pre-course, to 58% following course completion ($p < 0.01$). Our results suggest that the course is effective in meeting course objectives, but our small, self-selected sample size limits generalizability.

EMPOWERING RESIDENTS IN INTERPROFESSIONAL PRACTICE THROUGH 10-MINUTE MOBILE LEARNING MODULES So-Young Oh1; Jennifer Adams[1]; Sherry A. Greenberg[3]; Nina Blachman[1]; Sondra Zabar[1]; Lisa Altshuler[1]; Tara Cortes[2]. [1]NYU School of Medicine, New York, NY; [2]New York University, New York, NY; [3]New York University College of Nursing, Scotch Plains, NJ. (Control ID #2705588)

NEEDS AND OBJECTIVES: To address the need for sustainable, efficient interprofessional education and practice (IPEP) at the graduate level health professions education (GHPE), the NYU School of Medicine (SoM) and NYU Rory Meyers College of Nursing (NYU Meyers) designed IPEP, a mobile learning solution. We aimed to: ● Provide learners with applicable interprofessional (IP) practice skills ● Encourage reflection on IP care planning ● Develop an accessible and sustainable IP geriatric education curriculum for GHPE ● Collect residents' reflection on IP practice for future curriculum design
SETTING AND PARTICIPANTS: IPEP was housed on the NYU SOM learning management system. Since 2014, about 3500 learners from Health Professions schools across the U.S. have completed the 6 I.E. modules.
DESCRIPTION: Approach/Methods To overcome barriers (e.g. limited learning space, lack of faculty, heterogeneous curricula) NYU SoM and NYU Meyers developed a series of 10-min e-learning materials including didactic modules and virtual geriatric primary care patient (VP) cases. These are based on the undergraduate online IP modules, NYU3T: Teaching, Technology, and Teamwork. The modules address: ● IP teams/responsibility ● Effective healthcare teams ● Teamwork skills ● Communication skills Conflict resolution ● IP care planning 4 VP cases include IP assessment and management of older adults with chronic conditions. Reflective questions are integrated into modules and VP cases to stimulate critical thinking and attitude shift. In order to facilitate use, online modules and VP cases are designed in bite-size 10-min modules without heavy multimedia components. Thus, residents, nurse practitioners, and other graduate level providers can complete the modules via phone, tablets, or computers.
EVALUATION: Users rated modules very positively (4.2 out of 5). More than 80% of users responded the length of the modules were "just right"; about 90% agreed to "recommend the modules to others". About 500 learners completed four VP cases this last year. According to the validated questionnaire measuring attitudes toward IP teams, there was a significant change toward team value ($p = .006$) but no significant changes around team efficiency or physician's shared role on team.
DISCUSSION/REFLECTION/LESSONS LEARNED: Scheduling of IP activities, with joint clinical experiences and OSCEs, takes time, effort, and coordination of multiple schedules. The IPEP e-modules help smoother dissemination of IPE knowledge and skills to busy trainees. IP learners have found these a valuable resource. More VP cases for different populations may increase the application of IPE skills.

ENGAGING PGY2 AND PGY3 INTERNAL MEDICINE AND FAMILY MEDICINE RESIDENTS IN A HOSPITAL MEDICINE ELECTIVE Michele A. Sundar. Emory University, Atlanta, GA. (Control ID #2700696)

NEEDS AND OBJECTIVES: First year hospitalists are often unfamiliar with billing, coding, quality improvement, and have limited understanding of the key role of hospitalists in the larger hospital community. This elective aims to introduce residents to the non-clinical side of a career in Hospital Medicine, anticipating that their interest in this field will increase. The residents will also be given the opportunity to gain practical knowledge on billing, coding, and other relevant core topics. The elective addresses gaps in their traditional residency training, and therefore helps new graduates enter the field of Hospital Medicine with a higher level of functioning and an enhanced understanding of their role.
SETTING AND PARTICIPANTS: The elective occurs at Emory Saint Joseph's Hospital, a community hospital with academic affiliation. Upper level residents will be given a course description and can then choose to enroll. We expect 1–3 residents annually.
DESCRIPTION: The elective consists of 2 weeks of clinical time supervised by an attending physician. Residents will be managing patients with supervision, and also receive daily feedback regarding management decisions, communication style, and other aspects of care that impact outcomes and patient perceptions. There will also be 2 weeks of non-clinical time, focusing on self-directed learning and participation in various activities. Self-directed learning includes reading assignments and online modules addressing core topics: palliative care, nutrition in hospitalized patients, billing and coding, and prevention of health care associated infections. Residents will have the chance to join in a mock Root Cause Analysis, teach didactics to students, and learn from experts in Clinical Documentation Improvement. They will also be given the chance to learn how quality improvement is approached and structured at Emory Saint Joseph's Hospital. Committee attendance is required for: Utilization Review Committee, Patient Quality and Safety Meeting, and Pharmacy and Therapeutics Committee.
EVALUATION: Our primary goal is to assess how this elective has positively impacted their decision to pursue a career in Hospital Medicine. An oral interview at the end of the rotation will address this question, and also explore what non-clinical area most interests them. Our secondary goal is to measure the educational value of the self-learning activities. To measure our secondary goal, residents will be asked to complete an on-site pre-test and post-test at the immediate start and end of their rotation, which will be structured as a multiple choice test covering the core topics.
DISCUSSION/REFLECTION/LESSONS LEARNED: There are only a few training programs that offer electives in Hospital Medicine. As our goals

suggest, we hope that this elective will encourage more trainees to enter the field, and also provide them with guidance for structuring their career paths as hospitalists.

ENGAGING STUDENTS IN THE EVALUATION OF ASYLUM SEEKERS: BUILDING CAPACITY, TEACHING SERVICE AND RESILIENCE Katherine C. McKenzie[1]; Ranit Mishori[2]; Sonia Tajeda[1]. [1]Yale School of Medicine, New Haven, CT; [2]Georgetown School of Medicine, Washington, DC. (Control ID #2703679)

NEEDS AND OBJECTIVES: According to a report from the United Nations, in 2015 65 million individuals were displaced from their homes due to human rights abuses, torture and persecution and more than 172,000 individuals applied for asylum in the United States. Individuals with physical or psychological scars related to torture or ill-treatment benefit from a medical forensic evaluation when seeking asylum. The process of conducting an asylum evaluation requires specialized clinical skills. Despite training and recruitment efforts there is a reported shortage of providers who can respond to the increasing demand.

SETTING AND PARTICIPANTS: We report on two models of medical student engagement: 1) At Georgetown University, medical students working with a faculty advisor and with Physicians for Human Rights have created a program to train health care professionals, residents and students to perform medical evaluations for individuals seeking asylum in the United States. An associated curriculum was developed and focuses on refugee and asylee health topics, including torture, FGM, and trauma-informed care, among other topics; 2) At Yale University, trainees are offered opportunities to observe evaluations of asylum seekers behind a one-way mirror. Introductory literature about asylum medicine and a redacted affidavit from the client as well as pre- and post-evaluation counseling and discussion are provided to all participants. Trainees interested in more advanced involvement can perform evaluations and prepare a medico-legal affidavit after further training alongside a supervising physician.

DESCRIPTION: Both of these programs offer trainees instruction about the legal and historical precedents of asylum law. They receive instruction regarding empathetic interviewing of asylum seekers who are victims of trauma and scar recognition related to torture. Trainees are taught how to write a medico-legal affidavit documenting their findings. This knowledge in turn can be beneficial for all physicians who provide care to those who have experienced trauma, regardless of their immigration status. Both programs emphasize not only the clients' trauma and resilience, but also the potential for caregiver vicarious trauma and how to address it.

EVALUATION: Impact evaluation of both programs is in its early stage of instrument development, and process evaluation is ongoing. Assessments will include trainee response to the importance of human rights in medicine, satisfaction with different models and experiences of vicarious trauma.

DISCUSSION/REFLECTION/LESSONS LEARNED: Many medical students are interested in human rights, and specifically in caring for refugees and asylum seekers. We describe two educational programs and will reflect on: 1) opportunities to create similar program in other institutions, 2) lessons learned, challenges and barriers. Additionally, we will address the role of exploration of vicarious trauma and vicarious resilience.

ENHANCING DIVERSITY IN INTERNAL MEDICINE (IM) TRAINING: IMPLICIT BIAS TRAINING FOR RESIDENCY ADMISSIONS COMMITTEES Sarah Schaeffer; Katherine Lupton. University of California, San Francisco, San Francisco, CA. (Control ID #2706971)

NEEDS AND OBJECTIVES: Implicit racial bias is known to impact hiring decisions in multiple venues. It follows that implicit bias may impact how admissions committees evaluate and select candidates for residency admission. At the University of California San Francisco (UCSF), 30% of medical students identify as underrepresented in medicine (UIM), yet only 15% of IM residents are UIM. As part of a multi-pronged strategy to address IM resident diversity, we developed mandatory implicit bias training for intern selection committee members with the following goals: 1. Familiarize committee members with the concept of implicit bias and its impact on hiring 2. Empower committee members to identify their personal biases 3. Introduce strategies to minimize the impact of bias in residency admissions 4. Increase the number of UIM interns in UCSF IM residency in 2017-18

SETTING AND PARTICIPANTS: The UCSF IM residency program interviews 250 intern applicants and admits 62 interns each year. Forty IM faculty serve on the intern selection committee.

DESCRIPTION: We developed a 90-min training on implicit bias and its impact on hiring and admissions. Intern selection committee members were required to attend an in-person training or review an online module. Attendees completed Implicit Association Tests prior to the training. We began with a review of implicit racial bias and its role in hiring decisions. Attendees reflected on their personal biases and discussed experiences with bias in past intern selection. We presented evidence-based strategies for minimizing the impact of bias and discussed bias-reducing practices for the current cycle. At the end, participants submitted written commitments to use one or more strategies.

EVALUATION: Twenty-five committee members attended an in-person training. Attendees completed pre and post-training surveys. Prior to the training, 15% of attendees strongly agreed that implicit bias impacts their evaluation of applicants, compared with 39% after. At baseline 7% of faculty strongly agreed they could identify strategies to reduce bias, compared with 67% after. One hundred percent were "likely" or "very likely" to implement their written commitment.

DISCUSSION/REFLECTION/LESSONS LEARNED: IM residency admissions committees are not immune from implicit bias. A one-time implicit bias training raises committee members' awareness of personal biases and provides actionable strategies for combatting bias in residency admissions. Our intern selection committee is large; we were unable to reach all members with in person training. In future years we plan to offer multiple training opportunities during the year, and will develop admissions bias cases to stimulate advanced discussion.

ENHANCING RESIDENT PROFESSIONALISM: REWARDING CITIZENSHIP CHANGES BEHAVIOR Eric Green; Aasim Mohammed; Dhruvan Patel; Beth Silver-Cummons. Mercy Catholic Medical Center, Darby, PA. (Control ID #2701427)

NEEDS AND OBJECTIVES: In our residency program we noted decreased adherence by residents to administrative tasks. Residents required frequent

reminders by both GME staff and program directors to complete duty hours, required health screenings, and clinical documentation. Attendance at noon conference was low despite multiple reminders and efforts to improve lecture quality. In order to improve adherence to these tasks we created a resident “citizenship score” that was used to distribute sick (“jeopardy”) coverage.

SETTING AND PARTICIPANTS: Our program is a 67 person internal medicine residency based in 2 community teaching hospitals. Residents are assigned jeopardy coverage in blocks of 4 consecutive days during electives. Traditionally blocks were distributed evenly to residents throughout the academic year.

DESCRIPTION: In AY 2016–2017 we instituted a global citizenship score that included credit for timely duty hour entry, completion of medical records, compliance with administrative requests, and noon conference attendance. For each of these tasks, residents needed to reach a specific threshold in order to receive credit. For example, residents needed to have fewer than 5 pending discharge summaries to receive credit for completion of medical records, and attend > 70% conference to receive credit for noon conference while on a floor rotation. Duty hour entry and attendance were tracked through our web-based learning management system. Medical record completion was monitored by medical records staff. GME staff and chief residents compiled this data to form a composite “citizenship score” every 4 weeks.

EVALUATION: In the first 4 months AY2015-16, 67 residents attended 2381 hours of conference. In the same period in AY 2016–17, 67 residents attended 2840 hours of conference ($p < .001$ for difference). After 6 months of implementation 100% of residents entered duty hours without reminders; while in AY2015-16 multiple email and in-person reminders were required. After implementation, no residents had > 5 discharge summaries pending or any records > 28 days old, and 4% of residents had any evaluations incomplete after > 90 days.

DISCUSSION/REFLECTION/LESSONS LEARNED: Encouraging adherence to administrative tasks is challenging. By reframing completion of these tasks as professionalism and linking less professional behavior to a minor penalty - additional jeopardy call - we increased compliance. Although compiling the citizenship score required some time by GME support staff and chief residents, this time was partially offset by decreased time spend in reminders.

ENHANCING TRAINEE RESILIENCE, CONNECTEDNESS, HUMANISM, AND TEAMWORK- IF YOU BUILD IT, THEY WILL COME! Abby Spencer; Jennifer Ramsey. Cleveland Clinic, Chagrin Falls, OH. (Control ID #2706588)

NEEDS AND OBJECTIVES: Residency training is a particularly vulnerable time for burnout given. The goal of our FRAME curriculum is to enhance resilience, connectedness, teamwork skills, and emotional intelligence(EI) among medical trainees via small-group, interactive, facilitated reflective exercises and discussions. Each module has its own set of associated learning objectives. Residents will be able to: List critical components of resiliency Identify and describe the “most resilient” person they know Reflect on personal strengths and list those strengths to a thinking partner Describe a time when it was challenging to maintain the appropriate balance between humanism and objectivity Describe the benefits to patients and to self of maintaining your humanity Demonstrate professional and polite dissention during a role play Respond to a fellow team member’s emotion and provide empathy and validation Demonstrate using curiosity and empathy using role-play to de-escalate a team conflict Identify his/her own “work cycle preference” and describe what value it brings to the team

SETTING AND PARTICIPANTS: FRAME was implemented in 1/16 and involves five small groups of IM trainees that meet every five weeks for 2-hours. Residents remain in the same FRAME for all 3 years of training.

DESCRIPTION: We created an interactive educational series of small-group, facilitated discussions about strategies to increase resilience, empathy, EI, team-work, and communication skills. Residents share and reflect on these topics by reviewing related articles, essays and other media. Our highly interactive sessions teach through reflection, instruction, and asset-based discussions that foster connectedness and resilience. Facilitators encourage relationship development among residents by leading reflection exercises, listening with empathy and curiosity, keeping residents in dialogue, responding to emotion, and highlighting key teaching points.

EVALUATION: We collected: Immediate written feedback after each session (what worked, what didn’t, biggest “aha moment”) Resident reflective essays re:changes in attitudes, behaviors, resilience techniques, relationships with residents/faculty,connectedness, management of burnout/isolation Resident interviews and focus groups

DISCUSSION/REFLECTION/LESSONS LEARNED: Our pilot demonstrated that residents felt validated and better connected to each other and faculty to know that they struggle with the same issues and have found strategies to find the joy in their jobs again and again. Key outcome measures include enhancing the self-reported resilience and connectedness of trainees. Residents reported that they were surprised by how much they share regarding experiences, perspectives and feelings. Thanks to FRAME sessions, residents have begun to realize that the powerful physician experience affects us all similarly, and this realization strengthens trust and encourages openness among them in meaningful ways. FRAME builds awareness about how lonely or isolated some of the residents feel at times and gave them new ways to connect.

ENTRUSTABLE PROFESSIONAL ACTIVITIES: CAN SIMULATION BE USED TO ASSESS COMPETENCY IN MEDICAL STUDENTS? Katherine A. Gielissen; Tiffany Moadel; Ambrose Wong. Yale-New Haven Hospital, New Haven, CT. (Control ID #2689713)

NEEDS AND OBJECTIVES: Communication is critical for delivering safe and effective healthcare; however, it is difficult to assess these skills in real clinical settings. Entrustable professional activities (EPAs) address such challenges, as they help supervisors make competency-based decisions on a trainee’s ability to perform clinical work without supervision. Simulation offers an unique opportunity for competency-based EPA assessment in medical students by providing a controlled and replicable environment to objectively measure skills without any potential threat to patient safety. The goal of our study is to determine if EPAs can be effectively observed in a simulated setting and to develop assessment tools for entrustment decisions in oral presentation and handoff skills.

SETTING AND PARTICIPANTS: Our study focuses on EPA 6 and 8 of the AAMC’s Core EPAs for Entering Residency. We developed two emergency medicine cases (acute appendicitis and traumatic subdural hematoma) that elicit the skills of EPA 6 and 8. The competencies for these activities were mapped to ACGME milestone descriptors. We also developed EPA assessment

instruments to evaluate individuals participating in these cases on an entrustment scale. Data collection begins January 2017. We expect to recruit 140 trainees (20 MS1, 80 MS3, 20 MS4/MS5, and 20 PGY1) over 6 months. Performance on our EPA tools will be compared to previously established asessment tools for oral presentations and handoffs.

DESCRIPTION: The goal of our study is to determine if EPAs can be effectively observed in a simulated setting, and to develop instruments to assess competency in EPAs using simulation. This mixed-methods study encompasses the following specific aims: 1) Develop simulation cases to assess EPA competencies 6 and 8. 2) Validate assessment instruments for these EPAs to be used in simulated settings. 3) Determine if simulation-based EPA assessments reliably reflect bedside performance in learners across levels of training.

EVALUATION: Quantitative data will consist of 1) EPA performance in simulation settings on an entrustment scale, 2) EPA performance in real clinical environments, and 3) performance on previously described handoff and oral presentation tools. Qualitative data will be obtained in post-assessment encounters focusing on 1) trainee's perceptions of their own performance and 2) assessors' narrative description of entrustability for EPA 6 and EPA 8.

DISCUSSION/REFLECTION/LESSONS LEARNED: Preliminary data and lessons learned from our investigation will be presented at the SGIM National Meeting. Results of our work should address the feasibility of using a simulation-based EPA assessment tool, and should demonstrate its use in ad hoc assessment of trainee ability. Furthermore, the results of our study could have a more important impact in formative assessment of medical students and help inform other studies attempting to develop similar EPA assessment tools and inform trainee-specific learning plans on performance of essential communicaiton skills.

EVALUATION OF A LONGITUDINAL FACULTY DEVELOPMENT PROGRAM USING A QUALITATIVE DESIGN WITH MATCHED-CONTROLS Mary Ann Gilligan[2]; Deborah Simpson[1]; Karen Marcdante[2]; Linda Meurer[2]; Jeffrey Morzinski[2]. [1]Aurora Health Care, Milwaukee, WI; [2]Medical College of Wisconsin, Milwaukee, WI. (Control ID #2708754)

NEEDS AND OBJECTIVES: Ongoing faculty development is an expectation for clinician educators. Because faculty development requires significant investment of resources, effective evaluation is a priority. Steinert, et al. (2016) performed a systematic review of faculty development programs and reported gaps in study designs and outcomes; they called for qualitative and mixed methods studies to develop a better understanding of career changes and sustainability of new skills in the workplace. In our study, we sought to evaluate our longitudinal faculty development program using a qualitative approach.

SETTING AND PARTICIPANTS: Clinical faculty from three primary care clinical departments at a large, Midwestern medical school who completed our faculty development program (10 completers/year 2013–16) and their matched controls.

DESCRIPTION: We chose a qualitative approach using matched controls given the longitudinal nature of our program and the likelihood that career advancement would be expected in the time since completion of the program. Simpson & Marcdante's (2015) model for career development guidance for clinician educators was used to develop our "career and workplace impact" interview protocol. Key elements of the model include the fit between faculty interests and workplace needs, responsibility for career growth, and connecting with an academic community. A rigorous pilot study was conducted which included an interview performed by each study team member with an experienced, non-study eligible medical educator. Data were collected using a structured form. The team planned how to secure matched controls for each randomly selected faculty member who had completed our program, following a published model for selecting controls using criteria of 1) years in academic career, 2) medical specialty, 3) gender, and 4) interest in faculty development.

EVALUATION: Our qualitative study design, including a true pilot study, presented challenges in how to efficiently engage the IRB. Use of matched controls required unanticipated recruitment support. Preliminary data analysis has raised questions regarding treatment of outliers, fitting the data back to our career/workplace model, and organization of the written, narrative-focused report.

DISCUSSION/REFLECTION/LESSONS LEARNED: : Strengths of our method include the use of an evidence-based, model-driven evaluation approach and the skills and experience of our study team. The use of matched controls, while challenging to administer, is a best practice in evaluation that promotes greater meaning of outcomes and validity of findings.

EVALUATION OF A WORKSHOP INTERVENTION TO REDUCE RACIAL BIAS IN INTERNAL MEDICINE RESIDENTS' CLINICAL DECISION-MAKING Anne Stahr[1, 3]; Anna Kaatz[1]; Lacey Alexander[1, 3]; Amarette Filut[1]; Youhang Her[1]; Tyson Pankey[1]; Molly Carnes[2, 1]; Christine J. Kolehmainen[4, 1]. [1]University of Wisconsin, Madison, WI; [2]University of Wisconsin-Madison, Madison, WI; [3]VA, Madison, WI; [4]William S Middleton Memorial VA Hospital, Madison, WI. (Control ID #2702661)

NEEDS AND OBJECTIVES: Despite evidence implicating the role of implicit bias in the perpetuation of health disparities and hindrance of workplace diversity and equity, existing approaches to bias reduction demonstrate little success. Failing to provide physicians with the knowledge, language, and strategies to support meaningful behavior change may thwart progress towards a more culturally responsive healthcare system. The "Breaking the Bias Habit" workshop is a behaviorally-informed approach to reducing implicit bias for internal medicine (IM) residents. The purpose of this study is to evaluate the extent to which workshop intervention can reduce race bias in IM residents' clinical decision making. Towards this, we have 1) adapted and piloted an evidence based gender bias habit-breaking workshop to address race and other stereotype-based bias, and target IM residents; and 2) we have developed case vignettes and survey questions to assess the extent to which the workshop reduces race bias and increases knowledge and awareness of content presented in the workshop.

SETTING AND PARTICIPANTS: The workshop will be offered to January and February 2017 as part of the standard curriculum at the University of Wisconsin-Madison IM Residency Program. We will ask for volunteers to complete clinical vignettes and a questionnaire probing racial bias before the workshop, immediately after and at one additional distal time point.

DESCRIPTION: The bias habit-breaking workshop is composed of an introduction and three modules. Each module incorporates content and interactive elements that come from research on cognitive and behavioral change, and adult education.

EVALUATION: Clinical vignettes have been used as a surrogate for clinical interactions in multiple studies with mixed results in their ability to detect bias in clinical decision-making. For this study we created new vignettes and established their content validity with a modified Delphi procedure with seven experts on stereotype-based bias, including two internists. Following vignettes, participants complete four sets of measures probing: 1) how they would treat/care for the patient; 2) feelings and behavior they might direct towards vignette patients, measured with psychometric "should/would" scales (previously used to show discrepancy between what a person thinks they should do and what they would do—with a larger discrepancy indicating greater bias; construct validity has been established for these scales, and will use results from both studies to test reliability); 3) proximal measures of behavioral change evaluating awareness, motivation, self-efficacy, outcome expectation and actions; and 4) explicit racial bias temperature scales.

DISCUSSION/REFLECTION/LESSONS LEARNED: We expect our results to show some degree of bias in internal medicine residents and hypothesize our workshop will reduce bias in clinical decision making to some degree. Some preliminary data will be available after February 2017.

FACILITATING PATIENT-CENTERED LEARNING THROUGH A LONGITUDINAL PATIENT-PARTNERED CLINICAL EXPERIENCE

Joyce W. Tang[2]; Anshu Verma[1]; Grace Berry[1]; Venkatesan R. Krishnamoorthi[1]; Nicole M. Gier[1]; Anitra Thomas[1]; Lauren Wiklund[1]; David Meltzer[2]; Vineet M. Arora[3]; Jeanne M. Farnan[1]; Mari Egan[2]. [1]The University of Chicago, Chicago, IL; [2]University of Chicago, Chicago, IL; [3]University of Chicago Medical Center, Chicago, IL. (Control ID #2706804)

NEEDS AND OBJECTIVES: Patient-centered care is widely supported as an aspirational aim for health systems, with evidence to support improved patient satisfaction, treatment adherence, and clinical outcomes. Unfortunately, traditional educational models are not designed to prepare students to deliver such care, with few opportunities to experience care from the perspective of a patient or to engage longitudinally in their patients' care.

SETTING AND PARTICIPANTS: The Patient Centered Longitudinal Experience was created as a special track within a required first year clinical preceptorship course. Sixteen first year medical students were selected for participation based on interest in the program and consideration of a primary care career. Patient partners were recruited from the Comprehensive Care Program, which offers outpatient and inpatient continuity for patients at high risk of hospitalization.

DESCRIPTION: The goal of the program was to develop an understanding of patients' experiences with medical illness and patients' interactions with the healthcare system. Students were paired with two patient partners and an interprofessional team (physician, nurse, social worker, clinic coordinator) to co-navigate their patients' interactions with the healthcare system. Over 6 months, students accompanied patients to clinic appointments; visited patients during inpatient admissions; completed a home visit; contacted patients by phone; and met with a faculty preceptor monthly. Accompanying classroom-based sessions focused on skills with goal setting and making a home visit.

EVALUATION: Students submitted patient encounter logs ($n = 16$) and evaluation forms ($n = 14$); 14 patients responded to a phone survey. Over 6 months, students had a mean of 4.2 contacts (range 1–11) with each of their patient partners; logistical barriers (canceled visits) precluded more frequent contact. Seventy-two percent of students made a personal connection with patients; 100% had an improved understanding of challenges patients face in navigating the healthcare system; 57% reported increased interest in a primary care career; 21% reported they were an important part of the healthcare team. From the qualitative data, students emphasized gaining insights into the patient perspective (challenges in managing illness and navigating the healthcare system), and learning the value of a trusting relationship between care providers and patients. Patients appreciated their students' attentiveness and enjoyed their role as teachers to their students.

DISCUSSION/REFLECTION/LESSONS LEARNED: This pilot test of a novel patient-centered longitudinal experience suggests the program's potential to foster patient-centered perspectives by exposing students to both the challenges that patients face in managing their medical illnesses and navigating the healthcare system, as well as the value of longitudinal doctor-patient relationships. The program can be enhanced by addressing logistical barriers and more clearly defining an active role for students.

FLIPPING THE SCRIPT - A CONTROLLED TRIAL OF A FLIPPED-CLASSROOM AND BLENDED-LEARNING MODULE IN GRADUATE MEDICAL EDUCATION

Geoffrey V. Stetson[1, 4]; Varun Saxena[1, 2]; Elizabeth Harleman[1, 3]. [1]University of California, San Francisco, San Francisco, CA; [2]Kaiser Permanente, San Francisco, CA; [3]Zuckerberg San Francisco General Hospital, San Francisco, CA; [4]Veterans Affairs Medical Center, San Francisco, CA. (Control ID #2706166)

NEEDS AND OBJECTIVES: The "flipped classroom" is an educational approach that uses out-of-class time for learners to absorb content, and in-class time to apply that new knowledge. "Blended learning" is a combination of online and in-person education. Currently, the majority of didactic content in our residency program is delivered via in-person lectures. Scheduling conflicts make it difficult for residents to attend all lectures. We created a flipped classroom and blended learning module with the following objectives: − Ensure access to curricular materials for all learners - Maintain or improve learning outcomes - Maintain or improve learner satisfaction.

SETTING AND PARTICIPANTS: The University of California, San Francisco (UCSF) Internal Medicine Residency Program (IMRP) Intern Core Curriculum (ICC) includes all 68 UCSF internal medicine interns from the 2016–2017 academic year.

DESCRIPTION: The entire class was offered an online pre-test consisting of 11 questions related to the diagnosis and management of acute liver failure (ALF). Next, the class was split into two groups. The control group received the current standard: a one-hour in-person lecture on ALF. The intervention group watched online didactic videos using the same lecturer and content as the control group. After completing this pre-work, the intervention group worked in teams on ALF case-based activities and discussed their answers with the lecturer. The total learning time for the control and intervention groups were 60 and 70 min, respectively. Both groups completed a post-test and a survey (Likert-style + free-response) about their learning experience.

EVALUATION: Compared to the pre-test results, both groups performed better on their post-tests with five questions showing statistically significant improvement ($P < 0.05$). When comparing the post-test results of the intervention and control groups, the intervention group seemed to have performed better, however none of the differences reached statistical significance. There was no difference in satisfaction between the two groups. Free-response

sections of the survey showed that many residents enjoy the ability to learn at their own preferred speed via the videos, and the concept-reinforcing activity.
DISCUSSION/REFLECTION/LESSONS LEARNED: While no measureable differences between the two groups was revealed, benefits of the flipped classroom and blended learning should be noted. Specifically, given the discontinuous nature of residents' schedules, alternative learning modalities such as these offer flexible didactic learning opportunities. Furthermore, video lectures can serve as a useful adjunct resource for other learners, as well as content for faculty to easily disseminate. Our study was limited by a small sample size and high variance, which may have limited our abilities to detect a difference between the two groups.

FOURTH YEAR TEACHERS IN THIRD YEAR INTERNAL MEDICINE CLERKSHIP Judah Gruen[1]; Kathleen Waybill[2]; Lindsey Hall[2]; Steven Bishop[2]. [1]Washington University In St. Louis School of Medicine, Saint Louis, MO; [2]Virginia Commonwealth University School of Medicine, Richmond, VA. (Control ID #2705558)

NEEDS AND OBJECTIVES: The utility of fourth-year (M4) medical students teaching third-years (M3) may anecdotally be beneficial for both levels of students, but no studies exist to show its efficacy as a structured part of the M3 Internal Medicine Clerkship. The objective of this teaching pilot is to ascertain whether M4 teachers can create and lead clinical case-based sessions that increase M3 confidence in internal medicine topics.
SETTING AND PARTICIPANTS: Participation was voluntary, free from participant evaluation, and offered to all M3s at Virginia Commonwealth University School of Medicine (VCUSOM) in one four-week medicine clerkship block. An M4 student created learning objectives and clinical cases for each topic that were reviewed by a faculty mentor. An hour-long session was held weekly to discuss the case with a focus on stepwise clinical reasoning in a relaxed, non-graded setting.
DESCRIPTION: An M4 developed cases for four common problems seen on internal medicine wards that were not covered by the standard curriculum: cirrhosis, leukocytosis, acute kidney injury (AKI) and thrombocytopenia. The M4 led a weekly hour-long session to discuss the case with a focus on achieving the learning objectives. At the end of the clerkship, participating M3s completed a retrospective survey assessing their confidence with the learning objectives before and after the discussions. They scaled their confidence assessments using a Likert-type scale. Results were analyzed the Kruskal-Wallis test to determine if there was significant improvement in confidence for each learning objective.
EVALUATION: Students reported a statistically significant increase in confidence after the M4-led AKI ($n = 10$), thrombocytopenia ($n = 8$) and cirrhosis lectures ($n = 7$). For the AKI session, all six objectives achieved statistically significance with 5–20% of students expressing pre-session confidence and 25–50% with post-session confidence. For the thrombocytopenia session, two out of three objectives showed significant improvement with 12.5–18.8% pre-session confidence and 37.5–43.8% post session confidence. For the cirrhosis session, two out of three objectives were statistically significant with 7.1–14.3% pre-session confidence and 21.4–50% post-session confidence. None of the four learning objectives from the leukocytosis session ($n = 6$) were reported as having yielded statistically significant improvements in confidence. Qualitative comments did not give any indication as to the reason.
DISCUSSION/REFLECTION/LESSONS LEARNED: This pilot program shows the potential benefit of an M4 teaching elective that can build M3 confidence in important material and provide an early opportunity for M4s to be clinical educators. The reason for the lack of significantly improved confidence in objectives from the leukocytosis session is unclear but may be due to broad learning objectives for a complex topic, incompletely formulated cases, or teaching variability.

FUNNY BONES: DEVELOPMENT OF PHYSICIAN TRAINEE COMMUNICATION SKILLS USING IMPROVISATIONAL THEATER TECHNIQUES Carolyn Chan2; Brook Watts[1, 3]. [1]Louis Stokes Cleveland VAMC, Cleveland, OH; [2]University Hospitals Cleveland Medical Center, Cleveland, OH; [3]Case Western University School of Medicine, Cleveland, OH. (Control ID #2703111)

NEEDS AND OBJECTIVES: Physician trainees experience responsibilities that require communication skills to deal with the ambiguity, unpredictability, and nuances of health care conversations. We report on a novel pilot project using improvisational comedy to enhance physician trainee awareness and comfort in all aspects of communication.
SETTING AND PARTICIPANTS: All 38, first year categorical and medicine/pediatrics physician trainees in a large academic hospital Internal Medicine Residency program were split into 3 separate groups of 10–13 students for one-4-h workshop on medical improvisation techniques.
DESCRIPTION: A curriculum was designed with the following objectives which were adapted from prior medical improv curriculums: 1) develop familiarity with the art and theory of improvisation, 2) discover the connections between improvisation and communicating with patients, 3) encourage reflection on own communicating processes, and 4) apply specific improvisation techniques to enhance communication skills. Residents participated once in the workshop and it was delivered 3 times so far. This provided for three quality improvement cycles using evaluation surveys given after each session. Initial activities included role playing scenarios, improv exercises, and feedback discussions.
EVALUATION: Thirty-five of 38 trainees ($n = 35$; 92%) completed the workshop and evaluation. Three trainees had conflicts (e.g., clinical duties) that precluded full participation. An existing survey on connections between improvisational theater and medicine for medical students was adapted to 19 questions with a Likert scale (1–5) response format (1 'strongly disagree' and 5 'strongly agree'. Curriculum changes were made after reviewing evaluation results for each workshop. Incomplete/blank surveys ($n = 1$) were excluded. Results from the first workshop indicated less than half agreed "Studying improv could make me a better doctor" (40%; $n = 4$). Accordingly, the medical role playing scenarios were removed and the other activities/exercises were reframed as techniques to use with challenging patient encounters to increase relevance. For the next workshop session, 100% ($n = 12$) agreed that studying improv could make them a better doctor. Qualitative feedback suggested removing exercises participants did not find useful for skill building, e.g. practice improv exercises only targeting listening. For the third presentation, 100% ($n = 13$) agreed studying improv could make them a better doctor.
DISCUSSION/REFLECTION/LESSONS LEARNED: Three cycles of feedback helped to develop a workshop that was perceived as highly valuable for communication skills building. It also provided participants a "toolkit" to

use during difficult professional encounters. Next steps include continuing the program with new trainees and using validated surveys to evaluate change in skill-sets. Other workshop formats are planned to target self-identified weaknesses.

HIV PREVENTION WITH PREP/PEP AND SEXUAL HEALTH IN MEDICAL RESIDENCY: A NOVEL CURRICULUM Connie Park[2]; Rabea Khedimi[2]; Barry Zingman[2]; Jake Tinsley[3]; Joanna L. Starrels[1]. [1]Albert Einstein College of Medicine & Montefiore Medical Center, Bronx, NY; [2]Montefiore Medical Center and Albert Einstein College of Medicine, Bronx, NY; [3]AIDS Center, Bronx, NY. (Control ID #2697308)

NEEDS AND OBJECTIVES: A curriculum focused on HIV pre and post exposure prophylaxis (PrEP/PEP) has not previously been described. After completion, learners should be able to identify candidates who are eligible for PrEP/PEP and monitoring parameters once prescribed as well as perform appropriate sexually transmitted infections (STI) screening on at-risk patients and list current treatments for common STIs.

SETTING AND PARTICIPANTS: The Oval Center is a satellite health center of an urban academic medical center that focuses on PrEP/PEP and STI care. Participant learners are medical trainees including internal medicine residents and infectious disease fellows who choose the Oval Center as a two week clinical elective and/or as an additional continuity site.

DESCRIPTION: A formal curriculum in PrEP/PEP and STIs was developed and implemented at the Oval Center in July 2015 after informal discussions among medical trainees and faculty uncovered a large interest administering PrEP/PEP and STI care but lack of knowledge and training opportunities in their current practice settings. The curriculum is composed of three core components: 1) patient care, 2) didactic seminars, and 3) directed readings. Patient care ranges from 2–5 patients per session with a mean of 18.75 sessions per learner. Patients are seen by walk-in or appointment basis. Common reasons for visits include risk-based STI screening, symptomatic STI treatment, PrEP/PEP recommendation and initiation on eligible patients and appropriate follow up. Directed readings include current prevention and treatment guidelines and seminal papers from peer-reviewed literature. Two 30-min didactic sessions focused on evidence for current guidelines and best practices in disease prevention and management.

EVALUATION: In the first 18 months of the curriculum's initiation there were a total of 4 learners: 2 fellows and 2 residents. Participants were invited to complete a confidential paper questionnaire after at least 4 weeks following completion of their initial rotation to examine confidence in PrEP/PEP and STIs. Post intervention analysis found confidence was highest in recommending and monitoring patients on PrEP (mean of 4.8) on a 5-point Likert scale. It was also high in taking a comprehensive sexual history (mean 4.6), sexual risk reduction counseling (mean 4.6), conducting STI screening (mean 4.6) and treating common STIs (mean 4.6).

DISCUSSION/REFLECTION/LESSONS LEARNED: This pilot demonstrates that a training program focused on HIV prevention and sexual health was feasible and after completion, learners had high confidence prescribing PrEP/PEP and treating common STIs. The curriculum has been well-received by trainees and faculty and enrollment has nearly doubled in the last three months. Next steps include further examining the impact of the curriculum using pre-post analysis of learners' knowledge and behavior and change in PrEP/PEP prescribing rates, and expanding the curriculum throughout the health system, including integration into primary care training sites.

HOME BASED PRIMARY CARE CURRICULUM FOR PHARMACY RESIDENTS

Melissa Morgan-Gouveia; Pooja Dogra. Christiana Care Health System, Wilmington, DE. (Control ID #2707506)

NEEDS AND OBJECTIVES: Numerous studies have evaluated the impact of pharmacist home visits after discharge from the hospital on adverse drug reactions, emergency room visits, and hospital readmissions. Despite many pharmacy residency programs having home based primary care experiences, there is a lack of curricula on pharmacist training in home visits in the literature. We sought to develop, implement, and evaluate a home based primary care curriculum for pharmacy residents.

SETTING AND PARTICIPANTS: Eight post-graduate year 1 pharmacy residents at a single community-based teaching hospital participated in a home based primary curriculum from July 2014 - June 2016.

DESCRIPTION: We developed a 12 week longitudinal rotation where pharmacy residents spent one half day per week conducting home visits with a geriatrician. A Clinical Pharmacy Specialist accompanied on the first visit for orientation. Residents reviewed patient medication lists prior to the visit, performed medication reconciliation during the visit, reviewed findings with the physician during visit, and documented their findings and recommendations after the visit in the electronic medical record. Time in the car traveling between patients was used to reflect on visits, discuss patient care issues, and cover important teaching topics including polypharmacy, safe medication use in older adults, and transitions of care. Clinical documentation was reviewed and feedback given by a Clinical Pharmacy Specialist. Residents made follow-up phone calls to patients 1 week after the visit to assess impact of their intervention and logged their interventions in a clinical database.

EVALUATION: All residents completed a post-survey evaluation of the rotation and all rated "consistently true" that the rotation met the learning objectives and provided opportunities to provide patient-centered care. A total of 124 visits for 93 unique patients were logged in the database. An average of 3.09 (SD = 2.08) interventions were made per patient. The most common interventions were patient education ($n = 54$), adding ($n = 52$) or discontinuing ($n = 51$) a medication, and providing adverse drug interaction to provider ($n = 37$).

DISCUSSION/REFLECTION/LESSONS LEARNED: Home visits are a unique educational setting where pharmacy residents can learn complex medication management in a population with multiple comorbidities and identify barriers to medication compliance that may not be identified in the inpatient or office setting. Through this interdisciplinary collaboration, pharmacists were also able to educate physicians and make interventions with potential to improve patient outcomes.

I'M NO SUPERMAN: FOSTERING RESIDENT RESILIENCE THROUGH GUIDED GROUP DISCUSSION OF SCRUBS Arthur Holtzclaw; Jack Ellis; Meredith Hays; Christopher Colombo. Dwight D. Eisenhower AMC, Evans, GA. (Control ID #2704601)

NEEDS AND OBJECTIVES: Provider resiliency and burn out are recognized issues within the medical community, with increasing focus being placed

on residents. The Accreditation Council on Graduate Medical Education (ACGME) has made resident wellness a priority with recommendations to create programs or curriculums designed at addressing this essential topic at such a critical junction of their careers. We sought to stimulate open dialogue about these key topics with our residents by incorporating episodes from *Scrubs*, a popular medical television series.

SETTING AND PARTICIPANTS: Episodes were shown during protected academic time for internal medicine residents.

DESCRIPTION: Episode guides for six episodes from the TV series *Scrubs* have been created. Each episode is 22 min with each session lasting a total of 45 min to allow for discussion of topics such as physician burn-out, depression, fear, relationships, and dealing with death and medical errors. The episode guides summarize the episode and provide detail outlining the planned discussion objectives with open-ended questions occurring at pre-determined stopping points. These sessions are designed to be fluid and adaptable based on the needs of the residents and their current concerns with the intent to generate open communication, allowing for interruptions at any time for questions and providing shared understanding of the key objectives. Additionally, using existing episode guides as a template, participants in the program are encouraged to create their own guided discussion of episodes, expanding the program and ensuring its relevance for its target audience.

EVALUATION: We have established the baseline levels of burnout, depersonalization and satisfaction in the house staff by administering the abbreviated Maslach Burnout Inventory (aMBI). We will subsequently utilize the results of the aMBI for evaluation of improvement of resident well-being in addition to obtaining informal feedback to help improve the program.

DISCUSSION/REFLECTION/LESSONS LEARNED: By using television, we believe we have been able to engage the residents in an emotional experience, creating a shared understanding of the stressors inherent to this profession. We found that the element of humor in the episodes helped decrease anxiety over discussion of emotional/personal topics, allowing a much more informal, open setting than we have been able to obtain with more traditional formats. This openness has helped to destigmatize the personal struggles that all medical professional face, helping develop an esprit d' corps and bolstering a sense of belonging among the residents and staff.

IMPACT OF A NOVEL COMMUNICATION WORKSHOP ON SELF-REPORTED ATTITUDES AND PRACTICES IN TRAINEES WORKING WITH CANCER PATIENTS Rushad Patell; Alejandra Gutierrez; Katie Neuendorf. Cleveland Clinic Foundation, Cleveland, OH. (Control ID #2706428)

NEEDS AND OBJECTIVES: Patient communication, a cornerstone to effective health care delivery, has been shown to influence physicians' stress, job satisfaction and burnout. Communication in oncology is challenging as patients often ask emotional questions. Answering these questions without understanding the reason for asking can lead to patient and clinician dissatisfaction. Fostering competence in communication and professionalism is a well-recognized focus in medical training today. We aimed to assess the impact of a mini communication workshop focusing on the 'ask more and summarize technique' (AMST) on residents' attitudes and practices during an inpatient oncology rotation.

SETTING AND PARTICIPANTS: Residents assigned to an inpatient oncology rotation attended a mandatory workshop on clinician-patient communication, focused on AMST, led by a recognized expert.

DESCRIPTION: a difficult, emotionally charged or sensitive question. It involves asking a patient/family member to elaborate on what prompted the question and for the clinician to summarize back what was understood. This step allows the clinician to better understand the underlying motivation to the question, facilitates an empathic environment and thus allows time to prepare an appropriate answer. The workshop involved a short didactic followed by skills practice. A survey (S1) was administered to the residents upon completion of the workshop to assess their self-reported attitudes and practices as they related to AMST. A link to a follow up survey (S2) was sent at the end of the rotation via email to assess the usefulness of AMST, to identify the specific situations in which it was useful and barriers to use.

EVALUATION: Of participants ($N=21$) that completed S1, 71% were 25–30 years, 57% male and 67% PGY1. For S2 ($N=12$); 58% were 25–30 years, 58% male and 90% PGY1. Although there was no difference in reported frequency of 'Asking more information of patients questions' between the surveys ($P=0.73$), there was a reported increased frequency of 'Summarizing Back' between surveys ($P=0.01$). 62% reported the workshop was very useful. 95% felt AMST would be used at least daily. Addressing fear and anxiety (75%) and angry/upset patients (66%) were the situations AMST was found to be the most useful. 54% felt they could have used AMST more. Barriers included lack of autonomy and comfort with technique.

DISCUSSION/REFLECTION/LESSONS LEARNED: A structured communication workshop for house staff during an inpatient oncology rotation was well received. AMST is a novel technique that assists residents in challenges in the care of oncology patients, especially when addressing patients' fear, anxiety and anger. Communication and interpersonal skills training are prioritized in resident education and novel strategies to foster competency can improve patient care as well as improve resident experience.

IMPACT OF BEDSIDE ULTRASOUND COURSE FOR INTERNAL MEDICINE RESIDENTS Timothy Sterrenberg; Lucinda Fingado. Manatee Memorial Hospital, Bradenton, FL. (Control ID #2707463)

NEEDS AND OBJECTIVES: Demonstrate basic understanding of ultrasound technique, machine and terminology. Demonstrate improvement of knowledge from pre- test to post- test results. Learn to obtain quality views for cardiac ultrasound; including parasternal long axis, parasternal short axis, apical four chambers, and subxiphoid. Learn how to properly assess intravascular volume utilizing ultrasound. Learn how to differentiate between pleural and pericardial effusions in a rapid, efficient manner. Be able to incorporate this into daily patient visits.

SETTING AND PARTICIPANTS: Internal Medicine residency setting. Participants are the internal medicine residents, all three years.

DESCRIPTION: Residents are required to watch an instructional video prior to meeting with educators. They then take a 20 question pre- test. Once the test has been taken, review the answers with educators. After this they receive a lecture about cardiac ultrasound. Once completed they will then participate in mastering the fundamental echocardiography views including; parasternal long axis, parasternal short axis (aortic, mitral and papillary), apical four chamber, subxiphoid. In addition, they will learn intravascular volume assessment. They will do this on Vimedix Simulation Ultrasound. Once appropriate demonstration of skills shown pathology is incorporated as can be done with Simulation

Ultrasound. This will include thrombus identification, pericardial effusion, and pleural effusion to name a few.

EVALUATION: Evaluation to be done via the post test which they take after the initial course. There is also a follow up simulation ultrasound evaluation similar to initial evaluation by educators 3 months later.

DISCUSSION/REFLECTION/LESSONS LEARNED: Residents had positive feedback. They found this course very enjoyable. They also found the benefit of their new knowledge when seeing patients for the first time and for rapid responses. At my institution we are moving towards portable ultrasound which will provide them with immediate increased diagnostic abilities given their ultrasound skills acquired via this course.

IMPACT OF DEBRIEFING SESSIONS ON RESIDENT PHYSICIAN BURNOUT AND RESILIENCE Myung S. Ko[1]; Sam Brondfield[1]; Denah Joseph[1]; Larissa Thomas[2]; Jennifer Babik[1]. [1]UCSF, San Francisco, CA; [2]University of California, San Francisco, San Francisco, CA. (Control ID #2705474)

NEEDS AND OBJECTIVES: Nearly half of practicing physicians in the US experience burnout at some point in their career. Burnout in resident physicians has been linked to significant consequences including depression, lower work satisfaction, substance misuse, and reduced patient satisfaction. Interventions at targeting resident physician burnout include physician-directed interventions or organization-directed interventions. The objective of this project was to reduce burnout risk among internal medicine trainees, as well as provide evidence based, physician-directed tools for increasing resilience among trainees through implementation of monthly, debriefing sessions.

SETTING AND PARTICIPANTS: The study took place within the Internal Medicine Residency Program at University of California San Francisco (UCSF) during the 2016–2017 academic year. We implemented monthly interdisciplinary sessions, facilitated jointly by a palliative care physician and a chaplain. There were approximately 20 intern learners at each intern session and 12 resident learners at each resident session. Over the course of 12 months, all 62 internal medicine interns and a smaller number of anesthesia, neurology, and OB/GYN interns will participate in the intern sessions that occur while they are rotating at UCSF's Moffitt-Long Hospital, and 119 senior internal medicine residents will participate in the resident sessions that occur while they are rotating at UCSF's Moffitt-Long Hospital.

DESCRIPTION: The focus of the sessions was on support and sharing around difficult clinical situations. At the beginning of each session, the palliative care chaplain taught a 5 min didactic component around acquiring a specific skill or tool that promotes resilience, including mindfulness exercises to increase emotional awareness, as well as routine practice of personal reflection and use of positive psychology principles. The remainder of the hour-long session focused on allowing time for debriefing. During the sessions, house staff pagers were held by other colleagues to minimize interruptions. The curriculum was flexible and modular; there were a number of learning objectives, but the content of each session was determined by the needs of the particular group of attendees in that particular session. Each session included both affective and cognitive components to shift knowledge, skills and attitudes related to burnout and resilience.

EVALUATION: The efficacy of these sessions will be assessed by the distribution of validated pre- and post-intervention surveys assessing burnout and resilience. Qualitative notes were taken during each session.

DISCUSSION/REFLECTION/LESSONS LEARNED: Qualitative data from our sessions revealed that majority of our intern and resident physicians felt a sense of loss of meaning in their work as their work days became more inundated with navigating the complex medical system. Protective measures against loss of this meaning included increasing physical interactions with patients, and feeling empowered to reach out to one another for help.

IMPLEMENTATION OF A DEDICATED GLOBAL HEALTH CURRICULUM FOR INTERNAL MEDICINE RESIDENTS Alanna Stone; Jennifer Bracey; Dominique Cosco. Emory University School of Medicine, Atlanta, GA. (Control ID #2704965)

NEEDS AND OBJECTIVES: The Emory University Internal Medicine Residency first created a Global Health Distinctions Program (GHDP) in 2007. This program has evolved to include clinical rotations at the Indian Health Service (IHS) for PGY2s and in a developing country for PGY3s. On entrance and exit surveys, residents identified a desire for more knowledge of global health (GH) issues and clinical skills to provide care in resource poor settings. However, implementation of a formal curriculum while balancing clinical duties has been challenging. We sought to create a formalized curriculum for the GHDP with the following objectives: (1) establish fundamental understanding of GH, (2) provide defined skillset to be used while rotating abroad, (3) develop career mentorship for GH work.

SETTING AND PARTICIPANTS: Six PGY2 residents were selected to participate in the GHDP 2016–2018 cohort. They attended a new 16 hour curriculum in August 2016. To accommodate this, residency leadership agreed to assign all GHDP residents to a rotation in August that would allow dedicated time for participation.

DESCRIPTION: The curriculum was divided into four equal sessions. The first session provided an introduction to the program and an overview of major global health players and issues. The second session included didactic lectures on diseases in developing countries. The third session provided skills-based workshops on laboratory medicine and bedside ultrasound. The fourth session included a panel on careers in GH and resident presentations on topics of GH advocacy or policy.

EVALUATION: Participants completed an entrance survey identifying in free text individual goals for the GHDP (as referenced above). Additionally, they rated confidence in skills prior to curriculum delivery on a scale of 1–5: basic bedside ultrasound was mean 2.1, and basic laboratory skills was mean 2.9, indicating substantial opportunity for education in these areas. Content evaluations for the first two sessions were high with a mean 4.6/5 for both sessions. Free text comments suggested more case discussion would be helpful. Verbally, residents expressed greatest satisfaction with the interactive sessions and the career panel.

DISCUSSION/REFLECTION/LESSONS LEARNED: After identifying resident interests and needs, we were able to successfully implement a new 16 hour curriculum for residents in the GHDP. This curriculum was well-received and included faculty from public health, pathology, radiology and internal medicine. However, there is opportunity for fewer didactic sessions by moving certain topics to preexisting online curricula and, in return, implementing more interactive discussion and skills workshops. We also plan to establish a longitudinal scholarly project with our partner sites that can be continued through different resident cohorts.

IMPLEMENTING A QUALITY IMPROVEMENT CURRICULUM IN THE 4 + 1 SCHEDULE - LESSONS LEARNED AFTER 18 MONTHS

Carmen Vesbianu; Martina Jelley; Kristin Rodriguez. University of Oklahoma School of Community Medicine, Tulsa, OK. (Control ID #2706717)

NEEDS AND OBJECTIVES: Over the last decade residency programs have begun to teach quality improvement in an effort to comply with ACGME requirements and to optimize patient care. We created a didactic and experiential quality improvement curriculum with minimal faculty and clinical resources and integrated it in our 4 + 1 resident schedule.

SETTING AND PARTICIPANTS: Participants included all PGY-1, 2, and 3 Internal Medicine residents ($n = 32$) rotating through the one week ambulatory block at the OU School of Community Medicine Schusterman Center Clinic in Tulsa. The QI curriculum was delivered during one hour-long noon session each ambulatory block. Most sessions were led by one faculty leader and the research coordinator for the department.

DESCRIPTION: We introduced the curriculum in July 2015. The IHI Model for Improvement was the framework for this curriculum and included two key components: didactic and experiential. The brief didactic portion (20 min) focused on teaching residents the tools necessary to conduct a QI project and included: setting an aim, measurement tools, PDSA cycles, run charts, etc. Each didactic session was followed by a workshop (40 min) where residents had the opportunity to apply the knowledge acquired during the didactic session to their own longitudinal projects. Each firm ($n = 5$), comprised of 7–8 residents assigned to the same ambulatory block, designed and implemented one project that was completed by the end of the academic year.

EVALUATION: Evaluation included three elements: Resident knowledge using the Quality Improvement Knowledge Application Tool, residents' satisfaction with the curriculum with emphasis on self -perception of QI skills, and the success of the projects measured by presentations at medical meetings. All residents completed the questionnaires in year two. After curriculum implementation, residents showed a significant improvement in the QI knowledge (pre-QIKAT score 7.68 vs post-QIKAT 9.90, $p < 0.05$). There was a statistically significant difference in the resident self-assessment of QI skills (pre-course 16.3 vs post-course 19.3, $p < 0.001$).

DISCUSSION/REFLECTION/LESSONS LEARNED: This project demonstrates that a didactic-experiential quality improvement curriculum can be implemented successfully in a 4 + 1 schedule. The ambulatory week provides the perfect setting to deliver the longitudinal experience required for improvement cycles. The sequence of the didactic session followed by the hands-on session proved to be successful, as trainees learn better by doing. A great challenge for continuing the curriculum was obtaining "buy-in" from the residents. We realized that by facilitating opportunities for residents to present their projects we could increase their interest in the QI curriculum. A second lesson learned is that including clinic staff feedback and input is vital for the success of the project. Additionally, we learned that it is important to identify people with quality improvement knowledge and experience and invite them to participate in the curriculum delivery and mentor the residents.

IMPLEMENTING A WEB-BASED CASE DISCUSSION TO SUPPLEMENT THE SUB-INTERNSHIP EXPERIENCE: THE VIRTUAL 4TH YEAR TEAM

Irsk Anderson[3]; Oliver Hulland[1]; Jeanne M. Farnan[1]; Diane Altkorn[1]; Todd Stern[3]; Wei Wei Lee[1]; Vineet M. Arora[2]. [1]University of Chicago, Chicago, IL; [2]University of Chicago Medical Center, Chicago, IL; [3]University of Chicago Medicine, Chicago, IL. (Control ID #2701873)

NEEDS AND OBJECTIVES: The traditional subintern (SubI) experience is often experiential. The Clerkship Directors in Internal Medicine (CDIM) has identified a need for curricular reform. Patient variety is limited by patient populations, clinical site, duty hour restrictions and competing responsibilities. We have shown only 19% of SubI exposures to the 17 CDIM case scenarios came via personal experience. We hypothesize that a social media (SoMe) platform can increase exposure to patient pathology and augment discussion and learning. Our objectives were as follows: 1. Utilize SoMe to increase students' exposure to CDIM SubI curriculum. 2. Provide attending-moderated, student-level case discussions and identify salient learning objectives. 3. Foster a learning network for subI students at geographically disparate sites.

SETTING AND PARTICIPANTS: University of Chicago Medicine: Five Core Faculty members and all internal medicine subI's July 2014-June 2016

DESCRIPTION: *Social Media platform* Yammer® is a secure, private SoMe platform. Students were invited to a private group, UC4. Yammer® allows for the group's individuals to begin a conversation (thread), around a specific topic, tag those threads with supplementary files or images, and indexes the conversations in a searchable manner. Students attended a 30 minute training session on Yammer use, de-identifying PHI and following HIPPA guidelines..*Student-initiated case discussion* Students were required to submit 4 posts during their sub-internship, which could represent a patient case, teaching pearl, joural article etc. Students were required to participate in an additional 4 discussion threads. *Faculty facilitators* Faculty reinforced key topics/teaching points made during the discussions, corrected errors and monitored for HIPPA compliance.

EVALUATION: 47 fourth year medical students rotated on a medicine subinternship from 2014–2016. Within the first 3 months of the project, 100% of the CDIM training problems had been discussed. 89% of students were average to very satisfied with the Yammer® experience. 87% found it easy to use. 47% of sub-interns rated the Yammer® educational experience as above average to excellent. 77% felt the faculty participation prompt and helpful. 51% of students met their 4 post quota. 40% of students created 5–10 unique posts (i.e. more than required). Only 6% of participants noted privacy concerns. Positive feedback included: "liked the little pearls and discussing cases", "many students will really enjoy this forum" and "more enjoyable part of my Sub-I". Criticisms included: "not enough participants", "forced effort" and "burdensome".

DISCUSSION/REFLECTION/LESSONS LEARNED: Yammer® was a well-received addition to the traditional subinternship experience. Supplementing the required clinical experiences with a social media platform was feasible and the majority of students found it easy to use.

IMPLEMENTING STRUCTURED BEDSIDE US CURRICULUM FOR INTERNAL MEDICINE AND MED-PEDS RESIDENT EDUCATION: A SINGLE CENTER EXPERIENCE

Bilal A. Unar; Martin K. Reriani; jayanth G. vedre. Marshfield Clinic, Marshfield, WI. (Control ID #2706716)

NEEDS AND OBJECTIVES: The quality of resident education in point-of-care ultrasound (POCUS) is becoming increasingly important to residency programs. ACGME requires having facilities available for ultrasonography

but there is no formal training requirement and guidelines for Internal Medicine (IM) residencies. With the lack of trained IM faculty, we started the POCUS curriculum with trained specialists for PGY2 IM residents.

SETTING AND PARTICIPANTS: Nine PGY2 IM residents and two Med-Peds residents at Marshfield Clinic are participating in an established POCUS training course in academic year 2016–2017. The course is conducted at Marshfield Clinic Sim Lab. Residents will also take part in pre and posttest US knowledge and (audio-video recorded) skills test.

DESCRIPTION: Fourteen hour structured POCUS training course is conducted in seven - two hour - biweekly sessions at Marshfield Clinic Sim Lab. Each biweekly session is a live lecture followed by Hands-on practice on volunteer human models. The course consists of lectures on Basics of POCUS, Cardiac, Pulmonary, Abdominal, Musculoskeletal and Procedural US. Our ICU Intensivists, Rheumatologist and Emergency Medicine physician conduct these lectures. Half way to the completion of the course, there was a make-up/review session making a total of eight - two hour (16 hours) didactics on POCUS. Two pocket-US devices are readily available for IM residents on wards and ambulatory clinics.

EVALUATION: Since the implementation of formal ultrasound education for IM residents, in over two years, 18 Internal Medicine and 4 Med-Peds residents have had the opportunity to train and enhance their skills; as a result there is a ubiquitous use of POCUS on medical floors and clinics. Residents have started documenting their US findings and have also heightened their procedural efficiency. We have successfully conducted a pretest knowledge and US skills test for our current group of PGY2 IM residents and a formal IM oriented structured US education curriculum is currently being studied

DISCUSSION/REFLECTION/LESSONS LEARNED: We are among a small group of IM residency programs nationwide who are in the process of developing a structured US curriculum. We believe that a structured bi-weekly US training curriculum and 24/7 availability of pocket-US devices would aid in retention of resident's skills and knowledge. With the increasing positive feedback and interest in enhancing US skills, we are also planning to incorporate simulation based US skills training starting at the beginning of intern year with the intention of enhancing hands-on US training. Our ultimate goal is to set POCUS proficiency expectations for IM residents prior to their graduation.

IMPROVING INTERNAL MEDICINE RESIDENT EDUCATION IN LONG-ACTING REVERSIBLE CONTRACEPTION COUNSELING

Alexandra Bachorik; Michelle Jose-Kampfner; Holly Gooding; Grace Chen; Cristina B. Alexander; Rebecca Berman; Lydia E. Pace. Brigham and Women's Hospital, Boston, MA. (Control ID #2705868)

NEEDS AND OBJECTIVES: Internists often care for women with chronic diseases who may be at increased risk for maternal and fetal complications in the event of unintended pregnancy. Long-acting reversible contraceptive (LARC) methods are the most effective reversible contraceptive methods, safe in most chronic diseases, and thus are important preventive health interventions. However, training in contraception (including LARC) in internal medicine residencies is often limited and evidence suggests that internists have inadequate comfort with contraceptive counseling. Our objective was to implement a curriculum to increase internal medicine residents' knowledge of and comfort with counseling on contraception, with a focus on LARC.

SETTING AND PARTICIPANTS: This project was initiated and developed by a second year internal medicine resident and a chief medical resident with faculty support. It consisted of a 2.5 h didactic and interactive training session as part of the mandatory ambulatory medicine curriculum for all first and second year internal medicine residents at Brigham and Women's Hospital in 2016–2017.

DESCRIPTION: The first hour of the training consisted of a lecture with an overview of LARC, including efficacy, indications and contraindications and counseling strategies. The second section entailed 1.5 h of small group counseling role plays using cases, with mentorship from general internist and OB-GYN faculty. We have held a pilot session and 2 of 4 planned trainings.

EVALUATION: We administered immediate pre and post-tests to residents, collecting responses anonymously. We assessed changes in knowledge using McNemar's tests. Of 34 participants, 56% were interns and 18% were planning primary care careers. At baseline, most (82%) residents described comfort counseling about LARC; however, one-half had not referred any patients for LARC in the past year. After the training, residents demonstrated significantly improved understanding that LARC methods are appropriate for obese (74% vs 97%, $p = 0.02$) and breastfeeding women (74% vs 94%, $p = 0.04$), as well as improved understanding of IUDs' risks (77% vs 97%, $p = 0.02$); they demonstrated non-significant improvements in other knowledge domains. All residents noted that the training had improved their comfort counseling patients about LARC either somewhat (56%) or a lot (44%).

DISCUSSION/REFLECTION/LESSONS LEARNED: Preliminary results suggest that this curriculum is valuable in increasing internal medicine residents' knowledge and comfort counseling patients about LARC. We plan to refine the materials based on resident feedback and will incorporate it as a standard component of the BWH ambulatory curriculum.

IMPROVING MEDICAL RESIDENTS' ABILITY TO IDENTIFY AND ADDRESS SOCIAL DETERMINANTS OF HEALTH (SDH) IN THE AMBULATORY SETTING

Iman F. Hassan[3]; Mayce Mansour[2]; Lalit Narayan[5]; Casey Browder[3]; Viraj V. Patel[1]; Lauren Shapiro[4]; Darlene LeFrancois[4]. [1]Albert Einstein College of Medicine, Bronx, NY; [2]Icahn School of Medicine at Mount Sinai, Brooklyn, NY; [3]Montefiore Medical Center, Bronx, NY; [4]Montefiore Medical Center, Bronx, NY, NY; [5]George Washington Medical Center, Washington, DC. (Control ID #2706598)

NEEDS AND OBJECTIVES: Describe the link between SDH and health outcomes Identify SDH among clinic patients Provide targeted interventions using clinic and community resources for the following SDH: no/underinsurance, food insecurity, suboptimal housing, transportation barriers, need for supplemental income

SETTING AND PARTICIPANTS: Participants were 38 PGY2 IM categorical residents at Montefiore Medical Center, a tertiary academic center in Bronx, NY. The curriculum was administered during ambulatory blocks from 9/2015 to 5/2016.

DESCRIPTION: The curriculum included 3 didactic sessions on SDH, immigration and incarceration; an interactive workshop; a session reflecting on SDH in residents' own patients and a journal club session. In the workshop, students used sample cases to identify SDH and community and clinic resources to address them, building skills they then applied to their clinic patients. Faculty participated in a session on precepting SDH in clinic and were given evidence based teaching points. Resource sheets and a community resource website were available online for residents and faculty.

EVALUATION: Identical pre- and post-intervention surveys were administered to residents. The survey had 13 questions on demographics, prior experience, perceived barriers to addressing SDH in clinic, confidence levels identifying and intervening on SDH, and current rates of addressing SDH in the clinic. Confidence levels were measured via a likert scale from least confident (1) to most confident (5) and rates of addressing SDH in clinic were measured on a scale of 1–6 ranging from 0% to >20% of time spent. The survey also included 30 validated knowledge questions on healthcare access, SDH and health disparities and 3 questions on incarceration. Residents identified time and lack of knowledge as the most significant barriers to addressing SDH in clinic. Post intervention, knowledge as a barrier was reported significantly less (35.6% vs 62.1%, $p = .001$). Residents reported a significant increase in overall confidence in their ability to both identify patients' SDH (3.20 vs 2.77, $p = .002$) and create a plan to address SDH (3.09 vs 2.68, $p = .002$). Residents showed a significant increase in overall knowledge (59.5% vs 49.3%, $p = .000$). They also reported a significant increase in the overall proportion of patient encounters in the last 3 ambulatory blocks during which some time was spent identifying/addressing SDH (3.34 vs 2.96, $p = .049$). 90% of residents recommended the curriculum for future residents.
DISCUSSION/REFLECTION/LESSONS LEARNED: IM residents demonstrated improvements in knowledge, attitudes and self-reported behavior after receiving a SDH curriculum that emphasized clinic based interventions. Residents felt the curriculum was worthwhile. To further evaluate the curriculum, survey results from residents who received the curriculum will be compared with those from a historical control cohort of residents who did not receive it. Future steps include comparing referral rates to clinic resources both pre- and post-intervention and between intervention and control groups.

IMPROVING PATIENT-PROVIDER COMMUNICATION Taimur Safder; Robert G. Badgett. University of Kansas School of Medicine-Wichita, Wichita, KS. (Control ID #2706940)

NEEDS AND OBJECTIVES: A key challenge facing medical professionals today is to communicate effectively with their patients while dealing with the increasing demands on their daily schedules. Additional barriers are implementation of electronic health records (EHRs) and increasing pressure to improve documentation to support quality of care and billing. Our objective is to improve patients' ratings of communication skills of residents.
SETTING AND PARTICIPANTS: Patients and residents at the Internal Medicine clinic at the University of Kansas School of Medicine-Wichita (KUSM-W).
DESCRIPTION: *Surveys*: From the CAHPS 12 Month Adult English Survey, we used the six items regarding communication skills. All patients seen at the clinic were asked to fill out a paper-based baseline survey during five weeks spanning January and February, 2015. Follow-up survey was done during five weeks of January and February of 2016. *Intervention*: Each resident received their baseline scores in comparison to the program average as well as the national 90th percentile score at their 6-month evaluation. For each item that fell below 90th percentile of the national score, the resident was given a short evidence-based recommendation on how to improve. The evaluation was made available to the program directors of the residency for use during the biannual feedback sessions with the residents. *Outcome*: After the intervention, the same six items from the CAHPS survey was administered to patients. In addition, an online survey of residents measured their satisfaction with the feedback process and their intention to change communication practice after viewing feedback report.
EVALUATION: Our clinic's mean overall satisfaction with communication across the six items ranged between the 75th and 90th percentile nationally. There were no significant changes after the intervention. 66% of residents responded to the survey. 86% of residents agreed or strongly agreed the survey should be done regularly. 57% of residents agreed or strongly agreed in harboring intent to change practice in response to survey results.
DISCUSSION/REFLECTION/LESSONS LEARNED: This first improvement cycle using our intervention did not measurably affect communication skills as reported by our patients. The lack of improvement occurred in spite of residents' rating the quality of the project as a typical educational experience and half the residents reporting intent to improve communication skills. In addition, positive reception by our institution is suggested by the request of the residency program directors for our project to replace the prior surveys of patients. Our project demonstrates that the CAHPS tool can be implemented with minimum resources and serve as a low cost and customizable alternative to contracting with commercial services such as Press-Ganey. Future plans include acknowledge of high performing residents to their peers and better integration of the feedback with the overall biannual feedback provided to the residents by the residency program.

INCORPORATING HIGH VALUE CARE EDUCATION INTO THE INPATIENT MEDICINE EXPERIENCE Jacqueline M. Schulman[1]; Sonali Palchaudhuri[1, 3]; Paul O'Rourke[2]. [1]Johns Hopkins Bayview Medical Center, Baltimore, MD; [2]Johns Hopkins University, Baltimore, MD; [3]PRO (Providers for Responsible Ordering), Baltimore, MD. (Control ID #2698380)

NEEDS AND OBJECTIVES: There is a need to educate medical trainees about high value care (HVC). In particular, there is limited guidance about how to effectively incorporate HVC education at the point of care. In order to augment HVC education in the clinical setting, we developed a curriculum for internal medicine house staff and medical students that aims to teach and practice HVC on the inpatient medicine wards. After participation in the curriculum, we hope to enhance knowledge, attitudes, and practice patterns pertaining to HVC.
SETTING AND PARTICIPANTS: Our study population consists of residents, interns, and medical students at Johns Hopkins Bayview Medical Center who are randomly assigned to the HVC inpatient medicine ward team for two weeks. We expect approximately 30–50 participants in our study over the next six months.
DESCRIPTION: One of the four medical ward teams has been designated the HVC team. Prior to the start of the rotation, the attending physician and upper-level resident are sent the curricular objectives, with encouragement to incorporate HVC into daily discussions and patient care. Core components of the new HVC curriculum are two collaborative educational sessions organized on the team's non-admitting days. These sessions are facilitated by members of our HVC training team and emphasize the importance and impact of HVC on patients and the health care system, while providing the trainees with the tools to practice HVC and incorporate it into patient care. Learners are introduced to Bayesian thinking and are encouraged to incorporate pre-test probabilities into their patient rounding discussions. The team members learn about resources

that provide information on costs, harms, and benefits of medical tests and therapies. They also learn how to assess and counsel patients about financial burden, with the expectation that they will practice this skill at the bedside. In the second session, the team is guided through shared reflection of the care they provided during the rotation and is encouraged to evaluate whether Bayesian thinking and HVC principles were applied. They also review an itemized hospital bill for one of their patients. The bill review allows the team to assess whether and how the tests and treatments ordered impacted the care of the patient, and to propose alternative approaches for future patients.

EVALUATION: We are measuring impact by having learners complete pre- and post-rotation online surveys that include multiple choice and short answer questions. The surveys measure change in knowledge of HVC and attitudes toward HVC. They also assess the degree to which HVC principles were incorporated into patient care throughout the rotation.

DISCUSSION/REFLECTION/LESSONS LEARNED: Our goal with this HVC curriculum is to infuse HVC education directly into the care setting by ensuring that the material taught is directly related to the care being provided by the team. Rather than teaching concepts that are separated from the clinical work, we explicitly aimed to introduce material that can be utilized at the point of care.

INNOVATIVE MODEL TO TEACH JUDICIOUS OPIOID PRESCRIBING: A RESIDENT TEACHING PRACTICE SPECIALTY SESSION

Laila Khalid[2]; Serena L. Roth[2]; Ginger Wey[4]; Gianni Carrozzi[3]; Joanna L. Starrels[1]. [1]Albert Einstein College of Medicine & Montefiore Medical Center, Bronx, NY; [2]Montefiore Medical Center, Bronx, NY; [3]montefiore medical center, Bronx, NY; [4]Montefiore Medical Center, New York, NY. (Control ID #2706501)

NEEDS AND OBJECTIVES: Internal Medicine (IM) residents report low confidence and satisfaction in treating patients with chronic pain on opioids, in large part due to inadequate knowledge and preparation. To address dual aims of providing guideline-adherent patient care and training residents about judicious opioid prescribing, we developed an innovative resident teaching practice (RTP) specialty session for patients with chronic pain on opioids: Power Over Pain (POP) Clinic.

SETTING AND PARTICIPANTS: The POP Clinic is a weekly session at a large urban IM teaching practice that serves publically insured patients in Bronx, NY. The practice cares for approximately 300 patients on chronic opioid therapy (COT). Prior to the POP Clinic, there were no mandatory policies regarding care or precepting for COT patients.

DESCRIPTION: Since 9/2016, all patients on COT (>3 opioid prescriptions in 6 months) are required to be seen in POP Clinic at least yearly. The POP Clinic is staffed by PGYII-III IM residents who rotate thrice yearly. Residents see 1–3 patients per session and are precepted by any of three IM attendings with expertise in opioid prescribing. We developed a structured visit template to assess patient goals, pain/treatment history, current opioid regimen, side effects, functional status, mental health, substance use history, and opioid misuse. Precepting includes summarizing risks and benefits of opioid therapy, optimizing current medication regimen, and providing specialty referrals, joint injections, naloxone prescriptions, or referral to an on-call social worker. We emphasize patient education and nonjudgmental communication; preceptors accompany residents to observe their delivery, and feedback is given. We developed a focused didactic curriculum on pain and opioid management; half hour seminars precede each POP Clinic. Topics include safety and efficacy of opioids, multimodal pain care, opioid use disorder, tapering opioids, and interpreting urine drug tests.

EVALUATION: We are conducting a pre-post study using a questionnaire administered to residents prior to their first POP session and at the end of academic year. The questionnaire assesses residents' knowledge and attitudes about chronic pain and opioid management, and their experiences in POP Clinic. Using an ongoing registry of COT patients, we will examine outcomes such as change in opioid dose, pain and function, and patient satisfaction.

DISCUSSION/REFLECTION/LESSONS LEARNED: We have successfully developed and implemented an RTP specialty session for patients on COT within a large urban teaching practice. Though other educational interventions exist for teaching residents about care of patients on COT, such as online courses or didactic presentations, ours is among the first experiential interventions that uses designated sessions in which IM residents are precepted while providing a comprehensive pain assessment. We believe our innovative clinic can serve as a model for delivering guideline-adherent care and increasing resident confidence and knowledge in managing patients on COT.

INNOVATIVE TEAMS IN A LARGE ACADEMIC HOSPITAL RESIDENT CLINIC

mary fishman[2]; Ania Wajnberg[1]; Andrew Coyle[1]; Juan Wisnivesky[3]. [1]Icahn School of Medicine at Mount Sinai, New York, NY; [2]Icahn School of Medicine at Mount Sinai, NY, NY; [3]Mount Sinai School of Medicine, New York, NY. (Control ID #2704017)

NEEDS AND OBJECTIVES: Increase continuity for clinic patients cared by residents Expand faculty oversight of clinical care Improve resident outpatient education and feedback Encourage outpatient handoffs decreasing fragmentation and improving quality of care

SETTING AND PARTICIPANTS: Urban academic hospital clinic with 132 residents and 18 preceptors

DESCRIPTION: Historically, academic resident clinics care for underserved populations. Literature has shown that many of these clinics struggle with continuity, patient ownership and team-based care. The Mount Sinai Hospital Internal Medicine Residency Program has 132 residents who provide outpatient care in one large clinic. Previously, residents had an average of a 2 week outpatient block every 10 weeks with unpredictable schedules and supervision by as many as 8 preceptors each block. There was poor patient-resident continuity and little long-term oversight by a faculty member. In July 2016, the clinic was re-designed so that 15 residents were assigned to 2 faculty preceptors. Groups of 3 resident rotate together for two weeks at a time and are assigned coverage duties for their full team. They hand off to the incoming team any pending studies and active issues. Each team is only precepted by their assigned faculty preceptors who get to know their patients through continuous supervision. Teams are assigned 1000 patients to their panels.

EVALUATION: Surveys assessing residents' views on continuity, supervision, education and panel management were distributed In April-June 2016 and will be re-distributed in the spring of 2017. The response rate was 70%. In the pre-redesign assessment, just 28% of residents responded that they agree or strongly agree to the question "The current clinic scheduling allows me to work with a few preceptors most of the time." In response to the question: "My patients are consistently able to get appointments to see me" only 25% responded agree or strongly agree. In assessing the quality of feedback given, only 35% responded agree or strongly agree to the question "My preceptors

give constructive feedback." Finally, in response to the question: "When I am not on block the team model enables my patients to receive care from other providers they know and who know them" only 16% responded agree or strongly agree.

DISCUSSION/REFLECTION/LESSONS LEARNED: Residents prior to the re-design had poor continuity with their patients and with the faculty preceptors. Limiting supervision to 2 faculty members for all of the ambulatory care experience should improve resident oversight, feedback and efficiency. A tight team structure with handoffs should also improve continuity of care and satisfaction. To assess for improvement in these metrics a follow up survey is planed for the end of the academic year. Long-term follow-up will allow us to assess if these changes also lead to improved clinical outcomes.

INTEGRATING BASIC SCIENCES INTO INTERNAL MEDICINE RESIDENCY CURRICULUM THROUGH THE CASE METHOD PEDAGOGY Michael McShane1; Priyank Jain[2]. [1]Cambridge Health Alliance, Somerville, MA; [2]Cambridge Health Alliance, Cambridge, MA. (Control ID #2700374)

NEEDS AND OBJECTIVES: Cooke and colleagues claim that strong foundation in basic science "…developed and expanded during a lifetime of practice permits the intellectual flexibility on which adaptive expertise depends. (Cooke 2010)". Formal curriculum in basic sciences typically fades at the GME level. We are trying to counter that trend by implementing a resident taught curriculum that integrates basic sciences and clinical cases. The major objectives of this curriculum are to: 1) Create a learning experience for residents to explore basic science concepts in a case based format 2) Explore the pathophysiologic basis of commonly encountered disease processes 3) Recognize the relevance of basic science concepts on daily clinical practice

SETTING AND PARTICIPANTS: All PGY2 residents present a 75-min session once during our academic half-day. The session is attended by 15–20 internal medicine residents from PGY1-3.

DESCRIPTION: In the beginning of academic year a workshop is held on how to design a case method session. Each PGY2 is assigned a date for the case, a subspecialty faculty advisor, a pathology faculty advisor and pedagogy advisors. The subspecialty advisor helps identify a case and important clinical learning objectives, the pathology faculty helps with identifying and teaching the relevant basic science concepts, and the pedagogy advisors help put together a case method session.

EVALUATION: Each session is evaluated by a survey of learners at the end of the session that identifies learner engagement and satisfaction. To evaluate how the curriculum explores pathophysiologic concepts related to clinical care, we are collecting learning objectives created by residents during the session. To evaluate impact of curriculum on attitudes towards basic sciences, we are administering a questionnaire to PGY1 class and to all PGY2 residents that have participated in the curriculum, adapted from a basic sciences attitudinal scale by West and colleagues (1982).

DISCUSSION/REFLECTION/LESSONS LEARNED: We are yet to deploy the questionnaire focused on the attitudinal assessment of residents involved in this curriculum. To date we have had a robust case series, which involved the following basic science topics: 1) Anatomic and pathophysiologic explanation of portal hypertension and TIPS procedure 2) Correlating the laboratory data with biochemical nature of catecholamines and their derivatives in pheochromocytoma 3) Pathologic basis of classification of vasculitis and implications for clinical presentation One major challenge has been to coordinate with the various subspecialty services and to establish specific roles and expectations. Faculty investment has been critical and necessary, both from a content and coordination perspective.

INTEGRATION OF PHYSICAL THERAPY INTO AN INTERPROFESSIONAL PRIMARY CARE TRAINING CLINIC: CROSS BENEFITS FOR PROVIDERS AND PATIENTS Jennifer Walker[1]; Frank D. Buono[2]; Destiny M. Printz[2]; Brent A. Moore[2, 1]; Carly Croteau[1]; Rebecca Brienza[1, 2]. [1]VA Connecticut Healthcare System, West Haven, CT; [2]Yale University School of Medicine, New Haven, CT. (Control ID #2707486)

NEEDS AND OBJECTIVES: Musculoskeletal (MS) complaints are common in ambulatory primary care clinics. Interest in integrating physical therapy (PT) into primary care (PC) has increased. PT's knowledge of neuromusculoskeletal conditions may benefit PC providers and patients, who often have limited training and exposure to this area, as well as time in PC visits. Integration of PT providers into primary care training sites may increase PCP's knowledge of MS complaints, improve understanding of PT's role as well as improve patient satisfaction by providing warm handoffs to PT providers and starting patients on home exercise programs early. Our goal was to evaluate the integration of PT into an interprofessional PC training ambulatory clinic by measuring patient satisfaction, PCP referrals to PT, and patient adherence to PC PT referrals.

SETTING AND PARTICIPANTS: The Veteran Affairs Connecticut Healthcare System (VACHS) is part of the largest integrated healthcare system in the U.S. Within VACHS, the Center of Excellence in Primary Care Education (CoEPCE) is an integrated interprofessional ambulatory PC training program. The participant sample consisted of PC Veteran patients with referrals to PT within all PC clinics at the main campus. CoEPCE patients and providers participated in qualitative interviews.

DESCRIPTION: A satisfaction survey was given to CoEPCE patients who attended a PC visit with a physical therapist asked to come in to evaluate the patient as part of a warm handoff and then was referred for further PT. Data was collected from for PC patients who had referrals to PT in 2015–2016 to evaluate PT adherence and number of PC provider referrals between all PC clinics and year of referral. Additional qualitative data was collected from CoEPCE providers and patients.

EVALUATION: A Pearson correlation yielded significance in the number of referrals between PC clinics ($p = .001$). Satisfaction survey showed high means (4.71/5.00) for patient satisfaction and likelihood of future visits across three months. Qualitative data showed positive feedback from PC providers and patients: "I would say it's so helpful to have PT directly embedded in primary care. I have learned from having my physical exam findings confirmed or refined by PT and I think patients clearly benefit from starting their treatment on presentation rather than needing to wait for a follow up appointment".

DISCUSSION/REFLECTION/LESSONS LEARNED: CoEPCE's model of interprofessional training and care has provided an opportunity for workplace learning and to evaluate the integration of PT into PC and preliminary results reinforce the benefits of integration. The innovative usage of PT within a collaborative PC environment has provided PCP trainees unique support while demonstrating an efficient use of resources within the PC visit.

INTERN CRASH COURSE IN RESILIENCE BUILDING– AN INNOVATIVE EXERCISE IN CONNECTEDNESS AND VULNERABILITY DURING INTERN ORIENTATION! Abby Spencer[1]; Jennifer Ramsey[2]. [1]Cleveland Clinic, Chagrin Falls, OH; [2]cleveland clinic, Cleveland, OH. (Control ID #2707662)

NEEDS AND OBJECTIVES: Residency training is a particularly vulnerable time given for burnout. Our new program focuses on building resilience, fostering meaningful connections and reflections, and challenging assumptions that "it's just me". By end of session, residents will be able to: List critical components of resiliency List the benefits to self and patients of admitting/acknowledging when help is needed Describe 3 effective strategies for reaching out when in need of help

SETTING AND PARTICIPANTS: IM interns during intern orientation.

DESCRIPTION: We created an interactive educational series of small-group, facilitated discussions about strategies to increase resilience, connectedness, and ability/willingness to ask for help. In small groups each with its own faculty facilitator, interns reflected on the challenges and benefits of admitting what you don't know, impact on patients when you do and don't ask for help, how it feels to believe you're the only person who doesn't know the answer or what to do, managing vulnerability, managing isolation, managing uncertainty. Interns read short stories written by the prior year's interns about how alone they felt when they thought they were the only ones who didn't know how to manage certain clinical situations, and how they learned to ask for help. Interns then shared strategies with each other of mutual support, framing questions in a patient-centered way, and how to stay connected with each other.

EVALUATION: 100% Interns reported after the session that they were more likely to ask questions and speak up when they don't know the answer, felt more comfortable asking questions after the role-plays and discussions, felt more connected to their colleagues knowing they had similar fears, felt less anxious about intern year, and felt like they would be a better team mate.

DISCUSSION/REFLECTION/LESSONS LEARNED: Interns unanimously reported feeling more confident and comfortable asking for help, felt validated that they were not the only ones feeling scared, unsure, or incapable, and felt more connected to each other prior to even starting internship. While numerous studies have described the high rates of burnout, few have offered robust solutions at the training level to provide residents with the necessary skills to build resilience, enhance their connections to others, and to contribute to an emotional culture of support and teamwork. We believe we our interns started out on the right foot not only bonding socially, but already having deep facilitated discussions to enhance more meaningful connections.

INTERNAL MEDICINE RESIDENT ENGAGEMENT WITH A LABORATORY UTILIZATION DASHBOARD: MIXED METHODS EVALUATION OF A NOVEL TOOL FOR PRACTICE-BASED LEARNING Gregory Kurtzman; C J. Dine; Andrew Epstein; Yevgeniy Gitelman; Damien Leri; Mitesh Patel; Kira L. Ryskina. University of Pennsylvania, Philadelphia, PA. (Control ID #2697526)

NEEDS AND OBJECTIVES: The widespread adoption of electronic medical record (EMR) software enables the design of interventions that provide feedback to physicians via practice dashboards. However, little is known about trainee engagement with dashboards aimed to improve cost-effective care. To inform future efforts in using social comparison feedback to teach cost-effective care in residency, we measured internal medicine resident engagement with a dashboard providing feedback on their use of routine laboratory tests in comparison to service averages.

SETTING AND PARTICIPANTS: From January to June 2016, we tracked utilization of the dashboard during randomly selected 99 resident-blocks on six general medicine teams at the Hospital of the University of Pennsylvania (clinicaltrials.gov #NCT02330289).

DESCRIPTION: The dashboard reported resident-specific rates of routine lab orders (e.g. complete blood count). The data were presented in a web-based dashboard that interfaced with the EMR allowing users to drill down to individual patient records. Residents who were cluster-randomized to the intervention arm were emailed a snapshot of the personalized dashboard, a link to the online dashboard, and text containing resident and service utilization averages. We measured engagement with the dashboard using email read-receipts and a web-based tracking platform. Following completion of the intervention, three hour-long focus groups were conducted with residents about dashboard use. Using grounded theory approach, the transcripts were analyzed for common themes focusing on barriers and facilitators of dashboard use for practice based learning.

EVALUATION: Eighty unique residents participated in the intervention: 74% opened the email and 21% opened the link to the dashboard (Figure 1). The average elapsed time from receiving the initial email to logging into the dashboard was 28.5 hours (SD = 25.7). Participants who deviated from the medicine service average by one standard deviation of labs per patient-day (reported in body of email) had higher odds of opening the link to the dashboard (Odds Ratio [OR]: 1.48; 95% CI: 1.01, 2.17; $P = 0.047$). Focus group participants appreciated receiving individualized feedback delivered in real time that could be reviewed quickly. However, they raised concerns about a lack of adjustment for patient complexity and small sample size. Suggestions for inclusion in future iterations included patient satisfaction, timing of discharges, readmission rates, and utilization of consulting services, among others.

DISCUSSION/REFLECTION/LESSONS LEARNED: Overall, the engagement rates of internal medicine residents with the online dashboard were low. However, residents who deviated further from the mean were more motivated to access the dashboard. Residents in the focus groups were enthusiastic about receiving information regarding their personal laboratory ordering, both in terms of preventing iatrogenic harm and waste of resources. However, they raised important concerns and suggestions for improvements to increase the educational utility of such feedback.

INTERPROFESSIONAL HEALTH COACHING AT A SAFETY-NET HOSPITAL: A PROGRAM TO FOSTER TEAM-BASED CARE AMONG LEARNERS Jamie Yao[2]; Sandeepa Sriram[3]; Agnes Lau[3]; Tamara Lenhoff[3]; Jing-Yu Pan[4]; Pamela Bellefeuille[3]; Pallabi Sanyal-Dey[1]; Kelly B. Han[1]; Rita Nguyen[1]. [1]UCSF/SFGH, South San Francisco, CA; [2]University of California San Francisco, San Francisco, CA; [3]University of California, San Francisco, San Francisco, CA; [4]Albert Einstein, New York, NY. (Control ID #2687807)

NEEDS AND OBJECTIVES: The Society of Hospital Medicine has designed core competencies for both medical students and residents. One of these competencies includes systems-based practices, which involve

interprofessional teamwork. Given the complexity of managing chronic diseases, which are increasing in prevalence as the general population ages, there has been a renewed interest in multidisciplinary management of patients via patient-centered health coaching. Medical students, however, have minimal exposure to interprofessional environments until clinical rotations. Programs that incorporate communication skills from health coaching models in multidisciplinary teams can promote health professional students' knowledge and attitudes around interprofessionalism. To address the lack of early, clinically-based, interprofessional educational opportunities along with a need for patient-centered care in the hospital, we have established an inpatient, interprofessional health coaching program for health professional students called Word on the Wards (WOW).

SETTING AND PARTICIPANTS: First and second year students from the Schools of Medicine, Pharmacy, Nursing and Physical Therapy enrolled in an interprofessional health coaching program at an urban safety net hospital for elective credits. Faculty members representing each discipline trained students to deliver health coaching regarding hypertension, diabetes, substance use, and HIV care.

DESCRIPTION: Learners worked in interprofessional pairs to provide health coaching to hospitalized patients. Each session ended with learners reporting back to inpatient teams and primary care providers, sharing relevant information uncovered and questions raised during the visit. In addition, preceptors spanning the four health professions met with learners during each session to facilitate learning, reflect on their experience, and emphasize the different viewpoints that various providers can bring to a patient's care.

EVALUATION: Since October 2014, Word on the Wards has provided health coaching to over 200 inpatient encounters via 111 student health coaches. Feedback from learners has been overwhelmingly positive. Learners have expressed appreciation for and increased understanding of the knowledge base and training of other health professionals. Learners have found preceptor sessions to be particularly worthwhile in better understanding the perspectives of various providers to a patient's care.

DISCUSSION/REFLECTION/LESSONS LEARNED: Based on positive student responses, we have continued to expand the program's capacity and offerings. Overall, experiential learning via an inpatient health coaching program can serve as a novel and effective model for interprofessional education. Inpatient health coaching can provide valuable learning in the areas of health coaching skills and engaging underserved patient populations.

INTERPROFESSIONAL MASTER OF SCIENCE IN PALLIATIVE CARE: BRIDGING THE GAP BETWEEN PRIMARY AND TERTIARY PALLIATIVE CARE Amos Bailey[1, 2]; Regina Fink[4]; Shaun Gleason[3]. [1]Univierstiy of Colorado Denver, Denver, CO; [2]Birmingham VAMC, Birmingam, AL; [3]University of Colorado Skaggs School of Pharmacy and Pharmaceutical Sciences, Aurora, CO; [4]University of Colorado, Aurora, CO. (Control ID #2702414)

NEEDS AND OBJECTIVES: 1. Summarize need for more interprofessional Palliative Care healthcare providers and our programmatic response. 2. Demonstrate case-based woven curriculum designed for interprofessional adult PC learners. 3. Review initial student-self-assessment evaluations and learning outcomes of the curriculum with programmatic response.

SETTING AND PARTICIPANTS: Current workforce pipeline for PC providers is dramatically inadequate to meet the national need - many potential providers develop their interest later in their careers when it is difficult to relocate for the limited available opportunities for training. In response to this need, we developed an interprofessional Master of Science in Palliative Care (MSPC) at the University of Colorado Anschutz Medical Campus. The MSPC is a hybrid program offered primarily online with on-campus weekend intensives. Faculty and course content are sourced from nursing, medicine, pharmacy, bioethics, social work, spiritual care, psychology, and communication disciplines. The inaugural cohort (2016–17) consists of nurses, pharmacists, physician assistants, and physicians (16 students) and will be expanded to include social workers, chaplains, psychologists, and counselors.

DESCRIPTION: MSPC longitudinal curriculum spans 6 semesters of two three credit hour course; total of 36 credits. The online curriculum begins with 5–10 min patient/family/provider dialogue representing scenarios on the illness trajectory to demonstrate communication skills and illustrate learning points. Followed by two learning modules: biomedically-focused topic and related psycho-social-spiritual-ethics topic developed/presented by content experts from the interprofessional faculty. Content presented by pedagogical methods including readings, videos, Quizlets, knowledge checks, and narrated lectures. Student assignments vary from reflection/discussion to interprofessional case-based integration of topic materials. On-campus intensive focus on communication skills training and acquisition. Communication skills learned online are reinforced with videostaped standardized patients interaction with immediate feedback. Other topics include: working as an interprofessional team using simulated tasks common in PC clinical care, and self-care strategies. Demonstration of the curricular elements provided during presentation.

EVALUATION: Program evaluation is accomplished through a mixed method process including: learner self-assessments on 39 PC skills/tasks before, during, and after the program's formal training; self-reports on type/amount of PC in their practice; and standard course evaluations and scored communication skills exercises with standardized patients, semi-structured interviews and other methods.

DISCUSSION/REFLECTION/LESSONS LEARNED: Interprofessional master's program in PC, designed/delivered by nterprofessional faculty, fills a gap in the national PC workforce pipeline. Programs of this nature are scalable and meet the needs for PC training of mid-career providers who wish to transition into PC practice.

ONLINE RESOURCE URL (OPTIONAL): www.ucdenver.edu/MSPC

INTRODUCTION OF A NOVEL "GAMING" PLATFORM IN THE INTRODUCTION TO CLINICAL MEDICINE CURRICULUM TO ENHANCE LEARNING Ashley Hudson; F. Stanford Massie; Gaurav Jain; Erin Contratto; Lauren Walter; Frank Seghatol-Eslami; Michael Lyerly; Todd Peterson; James H. Willig; Victor Sung. University of Alabama at Birmingham, Birmingham, AL. (Control ID #2707438)

NEEDS AND OBJECTIVES: To date, student knowledge acquisition in the Introduction to Clinical Medicine (ICM) course has been assessed by quarterly quizzes. However, course evaluations noted discontent among students and faculty due to a perceived disconnect between the content tested on the quizzes and material presented during ICM sessions. We implemented a curricular innovation to enhance student learning of key concepts from assigned readings and content for ICM small group meetings (SGMs).

SETTING AND PARTICIPANTS: All medical students in the matriculating Class of 2015 at the University of Alabama at Birmingham ($n = 192$). The Clinical Skills Scholar (CSS) program is a group of 32 core clinical faculty members who teach and develop clinical skills of first and second year medical students during ICM.

DESCRIPTION: In July 2015, a novel gaming activity "Kaizen weekly ICM quiz game" was introduced into the ICM curriculum, replacing all quizzes in the ICM1 course. The web based platform administered 3–4 new multiple choice questions per weekly SGM. Upon completion of each question, students received the correct answer, a rationale, and the reference source of the question. Students were grouped into teams according to their ICM group (6 students and a faculty preceptor).Performance was tracked and reported on the Kaizen weekly leaderboard and awards given to top performing teams. Participation in the game made up ICM grade (8%).

EVALUATION: We evaluated satisfaction with the learning platform during annual course evaluations. 68% of students ($n = 186$) on the end of year course evaluation agreed (53.76%) or strongly agreed (13.98%) with the statement that "The weekly Kaizen questions enhanced my understanding and retention of key concepts from assigned readings and small group meetings." Representative statements from students include: "(Kaizen) motivates me to prepare for small group meetings", "(Kaizen) was a great way for ICM members to bond with each other and their preceptor", "The immediate feedback that Kaizen provides solidifies concepts and is helpful in review".

DISCUSSION/REFLECTION/LESSONS LEARNED: 'Gamification' in medical education has proven effective, and the Kaizen quiz-style game has been used successfully in GME. We incorporated a similar strategy to improve ICM engagement and promote healthy competition while learning valuable clinical skills in the first two years of medical school. Linking the content of weekly questions to individual ICM sessions made them practically applicable to SGMs, thereby reinforcing student understanding of the material while removing the burden of graded "quizzes".

ONLINE RESOURCE URL (OPTIONAL): None

INVESTING IN RESEARCH STAFF: STRATEGIC TEAMWORK FOR EFFECTIVE PRACTICE -MENTOR DEVELOPMENT PROGRAM (STEP-MDP) Christine M. Denicola; Lisa Altshuler; Sondra Zabar. NYU School of Medicine, New York, NY. (Control ID #2702391)

NEEDS AND OBJECTIVES: Skillful research staff members are critical to productive translational research teams and yet their ongoing professional development is rarely formally addressed. Through the Strategic Teamwork for Effective Practice-Mentor Development Program (STEP-MDP), we aimed to both create a community of practice (COP) for research staff and build the skills needed to enhance research team performance.

SETTING AND PARTICIPANTS: We selected 16 participants of 32 staff-level applicants from among the NYU Schools of Medicine, Social Work and Nursing for the first STEP-MDP cohort. Participants included research assistants, coordinators, managers and directors.

DESCRIPTION: We delivered 3, two-hour workshops, scheduled 3 weeks apart, focused on team communication, identifying team areas for improvement, and mentorship/coaching skills. Peer-Coaching Teams (PCTs) were created by paring participants at the same position level, and PCTs worked together at each session to explore and practice learned skills. Sessions featured brief didactics, group learning and exercises based on participants' real issues. A variety of active learning techniques such as brainstorming, role-playing, problem solving, and peer coaching were used. Practical core readings, worksheets and summary cards were provided. PCTs met between sessions to practice coaching skills, and troubleshoot problems.

EVALUATION: Participants ($N = 16$) completed a 37-item (4 point scale) retrospective pre/post self-assessment of team behaviors and skills, and a STEP-MDP evaluation survey at the end. We saw pre-post improvements in each of 5 self-assessment domains: Communication (4 items, Pre-mean 2.66, Post mean 3.36, $p = <.001$), Leadership (8 items, Pre-mean 2.76, Post mean 3.55, $p = <.001$), Empowerment and Motivation (12 items, Pre-mean 2.86, Post mean 3.51, $p = <.001$), Coaching (6 items, Pre-mean 2.40, Post mean 3.58, $p = <.001$), and Community (3 items, Pre-mean 2.33, Post mean 3.76, $p = <.001$). On average, PCTs met twice (range 2–4 times) between workshop sessions. One commented on the value of working with peers in PCTs, having no one in a similar position within his immediate work environment. Participants' written comments strongly endorsed the value of the workshops for their work, with the coaching skills session seen as the most valuable. Some participants worry that skills will decrease over time without continued reinforcement. All but one participant reported that they planned to continue with the PCT.

DISCUSSION/REFLECTION/LESSONS LEARNED: The number of applicants to our program suggests a need and motivation for staff to participate in the STEP-MDP. Participants' reported improved skills and sense of community. To maintain the COP and address worry about degradation of skills we are planning to remind PCTs to meet once a month and will follow up with them 3 and 6 months post intervention to evaluate their continued development.This spring we will enroll a 2nd cohort. We believe developing these core teamwork skills will lead to more collaborative, efficient, and innovative research.

IT'S ALL ABOUT RISK: AN INNOVATIVE PILOT CURRICULUM TO TEACH INTERNAL MEDICINE RESIDENTS ABOUT RISK COMMUNICATION AND DECISION AIDS Jen Rusiecki[1]; Jane Schell[2]; Carla Spagnoletti[2]. [1]University of Chicago, Chicago, IL; [2]University of Pittsburgh, Pittsburgh, PA. (Control ID #2703946)

NEEDS AND OBJECTIVES: Decision aids (DA) and risk scores (RS) are tools that bridge the gap in communicating clinical risk to patients and promote shared decision making (SDM). Little is known about residents' training in DA and risk communication. In 2015 a SDM curriculum began within University of Pittsburgh medicine residency. Residents improved their use of SDM skills but room for growth in the areas of communicating risk and use of DA remained. To address these deficiencies we enhanced our original SDM curriculum to include these additional foci. The objectives of this enhanced resident curriculum are: identify key components of risk communication, demonstrate risk communication skills by using DA both in simulation and clinical practice, identify facilitators and barriers to the use of DA.

SETTING AND PARTICIPANTS: The SDM/risk communication curriculum took place on 2 half-days monthly as part of the medicine and med-ped resident ambulatory rotation. Groups of 4–6 residents rotated through the curriculum each month for 6 months.

DESCRIPTION: This primary care-based SDM curriculum utilized didactics, standardized patient (SP) practice and reflection on clinical use of a DA. The

1st session, introduced the 7-steps of SDM (ID, equipoise, pros/cons, patient's values, understanding, negotiate a decision, and review) with discussion on how risk communication overlaps with these steps. Each resident had the opportunity to practice SDM skills, including using a DA, with an SP in one of two cases (starting a statin with an ASCVD risk of 8 and anticoagulation in a patient with new A. Fib.). Residents received real-time feedback from the facilitator, SP, and peers. Residents were asked to use a DA in clinic over the next 2 weeks and complete a reflective worksheet. During the 2nd session, the group debriefed their clinical experiences with using SDM skills and DA.

EVALUATION: A total of 25 residents participated. They were surveyed (response rate 56%) at the completion of the curriculum to assess their attitudes toward SDM, risk communication and use of DA. The most commonly cited benefit of using a DA was the visual display of risk (86% residents) and challenge was time limits (86% residents). Residents ranked their level of comfort and perceived importance of SDM on a 4-point Likert scale (1 = not important/comfortable, 4 = very important/comfortable). The mean total comfort score was 3.45 and importance was 3.03. Residents were asked to estimate their use of DA and RS prior to the curriculum and predict their use going forward. The majority reported that they used DA monthly prior and weekly after (43 and 50% residents respectively, $p < 0.01$). Residents reported discussing RS weekly with patients prior and daily after (50 and 57% residents respectively, $p = 0.03$).

DISCUSSION/REFLECTION/LESSONS LEARNED: Our risk communication/DA curriculum demonstrated that with training, residents can integrate these tools into practice to support their use of SDM. While our data is limited by self-report and small sample there was improvement in resident reported use of DA and RS.

LEADERSHIP EXCELLENCE EDUCATION- RESIDENTS/ FELLOWS (LEED-R): A NOVEL INTERDISCIPLINARY GME LEADERSHIP ELECTIVE Sneha S. Daya[1]; Allen Friedland[2]; Himani Divatia[2]; Shannon Barrow[2]; Barbara A. Monegan[2]. [1]University of California, San Francisco, San Francisco, CA; [2]Christiana Care Health System, Newark, DE. (Control ID #2702699)

NEEDS AND OBJECTIVES: To develop leadership skills/behaviors earlier in the careers of residents/fellows, to expose resident/fellow leaders to system-level thinking, to recruit and retain future physician leaders, and to provide a resident/fellow "voice" to senior leadership.

SETTING AND PARTICIPANTS: There are up to 25 select participants per cohort each year since 2013 (98 participants total) from 15 ACGME/non-ACGME accredited programs across two institutions (Christiana Care Health System and A.I. duPont Hospital for Children). Examples of specialties include Internal Medicine, Med/Peds, Podiatry, OB/GYN, Cardiology, Radiology, and Emergency Medicine.

DESCRIPTION: This course is designed as a two-week clinical-free elective, off-site from clinical campuses. Teaching modalities from local and national experts include classroom, e-learning, small group sessions, learning games, case studies, journaling, and networking with system leadership (LEED-Rship Café). Participants also complete a leadership project. Content is derived from evidence- based competencies from the National Center for Healthcare Leadership and Christiana Care Leadership Behaviors: promoting self-awareness, enabling learning and innovation, developing people and creating high performance teams, leading and promoting change, collaborating and building relationships, and creating value. These competencies translate into sessions on emotional intelligence, communications/presentations skills, negotiation, health care transformation, cultural competence, health care finance, and team management.

EVALUATION: Overall elective rating is 4.8 {1 (poor) to 5 (excellent)} since inception. The LEED-Rship Cafe is rated in the top five sessions each year. On average, 75% of graduates utilize a new skill within the first week of the elective. Representative comments include: "Very satisfied with this elective. It has changed my career for the better" and "The leadership elective is an unbelievable resource and opportunity for the enrolled residents. Furthermore, I hope the elective has a trickle-down effect on improving clinical, educational, and even personal interactions between all residents/colleagues."

DISCUSSION/REFLECTION/LESSONS LEARNED: Leaders in medicine are traditionally "accidental leaders," those with clinical expertise who may not have had formal training in leadership. This course aims to create "intentional leaders," with the skills for career advancement and leading change, developed at an earlier career stage. Up to 10% of the content is adjusted each year based on the most recent graduates' feedback and the learning needs of the upcoming participants, which can be challenging. The LEED-Rship Cafe is well-received, likely because participants interact with leaders from multiple disciplines, allowing for fruitful discussion.

LEARNING THROUGH SERVICE: 'SHIFA HOMES' A PROJECT OF SHIFA COLLEGE OF MEDICINE FOR REHABILITATION OF FLOOD VICTIMS. Shifa Umar[1]; Obaid Ashraf[1]; Mati ur Rahman[2]; Syed S. Shah[2]. [1]Allegheny Health Network, Pittsburgh, PA; [2]Shifa College of Medicine, Islamabad, Pakistan. (Control ID #2706918)

NEEDS AND OBJECTIVES: Learning through service is defined as an experiential learning opportunity that combines clear educational goals with service to the community. It has been broadly recognized as an effective method to engage medical students in active learning while providing needed health services to underserved populations. Community-based volunteerism is much needed especially in time of a natural disaster like the floods that affected Pakistan in 2010. Students and faculty of Shifa College of Medicine (SCM) initiated a project called 'Shifa homes' for rehabilitation of flood victims.

SETTING AND PARTICIPANTS: Community health sciences department and medical students of Shifa College of Medicine, Pakistan.

DESCRIPTION: 'Shifa Homes' is a capstone project of students of SCM to rehabilitate a flood-affected community in an underserved region of Pakistan. Phase one of the project involved raising funds for reconstruction of houses. As a part of integrating community based medical education, phase two involved performing a health needs assessment and implementing a health education campaign in the community. A team of student volunteers under faculty guidance designed a campaign focusing on personal hygiene, maternal and child health care and diarrheal and malarial diseases prevention. The team then annually visited the community for three years to implement the campaign.

EVALUATION: 46 houses have been built so far, forming a community of almost 200 people. Over a period of 3 years, 56 volunteer medical students have been involved in the project. Focused group sessions were conducted with volunteers annually to reflect on the experience. Volunteers reported that working for 'Shifa Homes' instilled social awareness and empathy. Provided

an opportunity to work as a team, helped with confidence building and developing management skills.

DISCUSSION/REFLECTION/LESSONS LEARNED: Experience in the community setting fosters social awareness, sensitize the students to community health needs and inculcates civic responsibility, hence setting the stage for a lifetime of service.

LETTERS-TO-THE-EDITOR: A NOVEL SCHOLARLY ACTIVITY IN RESIDENCY Konstantinos Lontos[1]; Daniela M. Hurtado[1, 3]; Anam A. Waheed1; Peter D. Bulova[1]; Natalia Morone[1]; Kathleen M. McTigue[2]. [1]UPMC, Pittsburgh, PA; [2]University of Pittsburgh, Pittsburgh, PA; [3]Mayo Clinic, Rochester, MN. (Control ID #2706375)

NEEDS AND OBJECTIVES: In this era of vast numbers of published studies, residency programs often seek methods to enhance residents' critical literature appraisal skills and ability to practice evidence-based medicine. Letters-to-the-editor are a method of post-publication review, which complements the pre-publication peer-review process.Residents may be well-positioned to engage in letter-writing.

SETTING AND PARTICIPANTS: The UPMC Internal Medicine Residency Program has two specialized tracks designed to prepare residents for a career in academic medicine and research, the Clinical Research Track and International Scholars Track. Starting in academic year 2014–2015, the program leadership incorporated letters-to-the-editor writing into the seminar's curriculum.This pilot project was implemented for second-year residents of the track

DESCRIPTION: During the first half of the academic year, the longitudinal research seminar was reorganized to include sessions describing the new scholarly activity's objectives, the potential scientific benefits of writing letters to the editor, and practical tips on how to work with a mentor to develop a publishable letter. Residents were instructed to work with a faculty mentor to identify a recently published manuscript, write comments about it, and submit their letters for publication. Subsequently, participating residents presented their letters and described their experience throughout the process.

EVALUATION: During the academic years 2014–2015 and 2015–2016, eighteen second-year residents were asked to write a letter-to-the-editor. At the beginning of the academic year 2016–2017, these residents were asked to complete an anonymous online survey through Qualtrics. The survey was completed by all participating residents (100%).

DISCUSSION/REFLECTION/LESSONS LEARNED: In summary, the results of the survey were quite encouraging for this innovation. The publication rate was high (44%) and the publications were in predominantly high-impact journals (average impact factor 16.9). Residents gained experience in scientific writing (59%), improved their critical appraisal skills (53%), engaged in scientific dialogue (53%) and enhanced their knowledge through the literature review (41%). Common barriers were limited timeline allowable at the journals (65%), lack of experience with prior letter-writing (41%), limited expertise on the topic of interest (41%), mentor's time limitations (35%) and limited free time because of residency training (35%). The majority of our residents wrote a letter to encourage dialogue and debate about a topic (44%), to add new information (28%) and to state an alternative point of view (28%). Most of our residents stated that probably they will write again a letter in the future (50%), while a few of them considered it a possibility (39%). Our curriculum evaluation team is encouraged by the high publication rate and multiple benefits of letter writing that were identified by track participants, which suggest that formal training in letter writing can foster skills in public scientific discourse.

LOOKING AT THE FUTURE OF MEDICAL EDUCATION THROUGH MICROSOFT HOLOLENS Lu Dai; Anne Song; Neil Mehta. Case Western Reserve University, Cleveland Heights, OH. (Control ID #2706450)

NEEDS AND OBJECTIVES: Microsoft HoloLens is an augmented reality headset that integrates three-dimensional holograms with reality. Until recently, the field of augmented reality in medical education has been limited to devices still constrained by two dimensions (e.g., computers, mobile devices). This study aimed to determine: 1) whether HoloLens adds value to the teaching of cardiac anatomy and physiology; and 2) the optimal strategy to implement it in the curriculum.

SETTING AND PARTICIPANTS: Thirty-two first-year medical students at Cleveland Clinic Lerner College of Medicine of Case Western Reserve University participated in the study.

DESCRIPTION: Two HoloLens modules were developed for the first and last weeks of the 7-week Year 1 Cardiology block. During week 1, students individually explored the first module, designed for self-study. During week 7, students explored the second module as a group under faculty guidance. Surveys after each session asked students to rank HoloLens compared with traditional parts of the curriculum in terms of their cognitive load, efficiency, helpfulness, and enjoyment.

EVALUATION: We received 14 and 28 responses for the first and second survey, respectively. Overall, the majority of students (64%) agreed that HoloLens would enhance the way cardiology is currently taught. In comparing the two sessions, students felt HoloLens contributed more to their learning during the second (faculty-led) session ($p = 0.024$) compared to the first (self-study) session. There were also trends towards the second session being more enjoyable ($p = 0.081$) and decreasing cognitive load ($p = 0.096$). Students stated they preferred the faculty-led session because it was more organized and also because they felt more comfortable operating the HoloLens the second time around.

DISCUSSION/REFLECTION/LESSONS LEARNED: Our study revealed that students believe the addition of HoloLens would be valuable to the medical school curriculum. They also prefer faculty guidance during learning sessions over individual exploration, which affects how HoloLens may be implemented into the curriculum in the future. It also appears that familiarity with HoloLens increases its perceived educational value. Thus, learning sessions would ideally be carried out as a faculty-led group, particularly with initial HoloLens use. If faculty guidance is not available, sessions could benefit from a detailed orientation on how to navigate the device along with a guide of particular views that are most informative for understanding certain concepts.

MAKING THE EX-PERT EX-PLICIT: ADDITION OF A CLINICAL REASONING MODERATOR TO THE CLINICAL PROBLEM SOLVING CONFERENCE Deborah DiNardo[3]; Sarah A. Tilstra[4]; Thomas Painter[1]; Melissa McNeil[2]. [1]University of Pittsburgh, Pittsburgh, PA; [2]University of Pittsburgh Medical Center, Pittsburgh, PA; [3]University of Pittsburgh School of Medicine, Pittsburgh, PA; [4]University of Pittsburgh

School of Medicine/Medical Center, Pittsburgh, PA. (Control ID #2705369)

NEEDS AND OBJECTIVES: In a 2015 report, the Institute of Medicine highlighted key issues that must be addressed as part of efforts to reduce diagnostic error, and called for better training in decision-making at all levels of training and across all disciplines. While components of clinical reasoning are infused into standard residency education, explicit instruction regarding these principles is often lacking. Furthermore, the quality of clinical reasoning education can be highly variable when a common language for discussion of clinical reasoning principles does not exist, and when clinical teachers lack the skills to make their reasoning processes explicit. One approach to this educational challenge has been pursued in the medical literature: various journals publish clinical problem solving exercises that include an expert's approach to an unknown case paired with explicit discussion of relevant clinical reasoning principles. Following this model, we developed an interactive case-based conference with a focus on discussion of clinical reasoning principles, including cognitive bias.
SETTING AND PARTICIPANTS: Our interactive "Clinical Reasoning Case Conference" is delivered on a monthly basis at each of the three training sites for the University of Pittsburgh Internal Medicine Residency training program. Participants include faculty, residents, and medical students in Internal Medicine.
DESCRIPTION: Our monthly "Clinical Reasoning Case Conference" includes sequential delivery of clinical information from a real patient case to an expert discussant, who in turn describes their approach to the unknown case in a "think-out-loud" format. The conference is facilitated by a clinical reasoning expert faculty member, who probes the discussant and the audience about the clinical reasoning processes being used and provides explicit commentary regarding clinical reasoning concepts and cognitive biases that could impact the case.
EVALUATION: Our conference series has become a favorite of faculty and trainees alike; trainees seem to, in particular, value the role modeling of the approach to diagnostic uncertainty by experienced faculty. Faculty interest in serving as the expert discussant has increased steadily, as has trainee participation in clinical reasoning discussions. In addition, we have observed increased levels of familiarity with core clinical reasoning concepts and vocabulary by both faculty and residents.
DISCUSSION/REFLECTION/LESSONS LEARNED: Traditional unknown case conferences tend to focus on the ability of an expert discussant to reach a difficult or unusual diagnosis, often without an explicit focus on clinical reasoning principles that can be applied more broadly by learners. We have found that the addition of a clinical reasoning moderator to the "clinical problem solving conference" format has contributed to the development of a shared clinical reasoning vocabulary within our program and to the dissemination of clinical reasoning skills for application in the clinical setting for patient care and teaching.

MITIGATING UNCONSCIOUS BIAS IN RESIDENT APPLICANT INTERVIEWS Johanna Martinez1; Karen Friedman[1]; Kyle Katona[2]; Kelly Spielmann[1]; Yonathan Litwok[1]. [1]Northwell Health, Lake Success, NY; [2]Northwell Health, Manhasset, NY. (Control ID #2706665)

NEEDS AND OBJECTIVES: Racial, ethnic, and gender diversity helps ensure a more comprehensive research agenda, improves patient care, and is an institutional driver of excellence. Juxtaposed to this notion, physician workforce diversity remains a challenge. It has been hypothesized that unconscious bias may be a contributor to the lack of physician diversity, given it is known that unconscious bias can impact the evaluation and selection of applicants. Yet less is known about what strategies exist to mitigate this possible bias. Our objectives were to 1) measure baseline self-perceived bias in faculty members that interview medical school applicants for incoming residency positons, and 2) to train these faculty members on the AAMC's suggested "Best Practices for Conducting Residency Program Interviews", with the aim of mitigating unconscious bias during the interview process.
SETTING AND PARTICIPANTS: All Internal Medicine faculty members at Northwell Health's main campus who conduct residency applicant interviews completed the faculty development training on interviewing best practices.
DESCRIPTION: Faculty members competed a 60 min training which included a brief didactic on the AAMC suggested best interviewing practices, content on behavioral interviewing techniques, specifically focused on the STAR acronym (situation/task, action, results) and published data on unconscious bias. A video with role-plays highlighting examples of "good" and "bad" behavioral interviewing responses was then watched. In order to apply knowledge, faculty members then scored the role-plays using a structured rubric. After completing the scoring rubric individuals were asked to reflect and share with the larger group why and how they selected their answer and scored each role-play. The discussion included probing questions about the possibility of unconscious bias impacting individual's scoring.
EVALUATION: A pre-post survey was completed by faculty members completing the training to assess their knowledge of the STAR acronym, prior training on structured interviewing techniques and self-perceived bias. Approximately 90 participants completed the training and 84 completed the pre-survey. Post survey data is pending and currently being collected. At baseline, only 36% of participants reported using behavioral questioning in their prior interviews and 20% could correctly answer what the STAR acronym signified. The majority (56%) acknowledged that unconscious bias plays a role in how they score applicants.
DISCUSSION/REFLECTION/LESSONS LEARNED: The overarching goal is to demonstrate a positive impact on bias and diversity. This training is a first step toward that goal, given it provided faculty members with knowledge of the AAMC recommendations, awareness of the impact of unconscious bias and skills around structured interviewing. Next steps include a more robust assessment of interviewing skills and measurements of bias via enhanced training with the use of standardized applicants.

MOUNT AUBURN HOSPITAL INTERPROFESSIONAL LEADERSHIP ACADEMY (IPLA) Stephanie Page; Patrick L. Gordan; Rebecca Logiudice. Mount Auburn Hospital, Cambridge, MA. (Control ID #2706672)

NEEDS AND OBJECTIVES: Collaborative leadership is needed at all levels and between disciplines in a healthcare organization. Literature supports the idea that interprofessional education improves patient outcomes and work efficiency. We identified a need for interprofessional leadership development within our community. Although leaders have differing responsibilities, we believe there is a core set of leadership skills that is broadly relevant. There is value in leaders from different healthcare fields learning to approach management and leadership challenges together. IPLA aims to enhance the leadership

skills of a diverse group of clinical and non-clinical professionals who already have or aspire to leadership roles. The program helps participants understand themselves as leaders, recognize the broader healthcare environment, become change agents and learn how to lead their teams to provide high quality patient centered care.

SETTING AND PARTICIPANTS: IPLA is open to all staff members, clinical and non-clinical, at Mount Auburn Hospital in Cambridge, MA (a Harvard teaching hospital). It is targeted to individuals early in their leadership role. Sessions occur twice a month at the hospital.

DESCRIPTION: IPLA is a 9-month program offered annually to 15–20 leaders at Mount Auburn Hospital to help develop their leadership skills. They hold diverse roles: physicians, nurses, therapists, chaplains, information technologists, environmental services engineers, finance professionals, etc. IPLA is composed of a series of seminars and a group project. An invited expert leads a discussion at each session about an important leadership skill such as emotional intelligence, wellness, team building, conflict resolution, and leading change. There is a didactic component and the opportunity to practice applying new skills. Speakers are from the Boston area, with over half from our own institution. In the second part of the year group projects are launched which require the application of leadership skills and interprofessional team building as learned throughout IPLA. These projects are presented to hospital leadership at the year's end. IPLA started in August 2015. The cost per participant is $350, which includes speaker fees, books, and case studies.

EVALUATION: Each cohort takes a pre- and post survey to assess changes in leadership skills. Data from the first year have been collected and analysis soon to begin. Each session has an evaluation form, allowing participants to give feedback to improve IPLA for future cohorts.

DISCUSSION/REFLECTION/LESSONS LEARNED: In our community hospital we recognized a need for an interprofessional leadership development program to help prepare junior leaders for success. The participants learn new skills and gain opportunities to discuss work challenges and share solutions, as well as forging a stronger interprofessional network. This model for an interprofessional leadership academy is one that can be replicated in other healthcare institutions.

MOVING BEYOND FACE TO FACE VISITS: A MODEL OF PROTECTED TIME FOR COACHED POPULATION HEALTH AND LONGITUDINAL CARE

Andrew A. Chang[1, 2]; Melissa S. Lee[1, 2]; Moses Lee[1, 2]; Nikita Barai[1, 2]; David Stevens[1, 2]. [1]Health + Hospitals Kings County, Brooklyn, NY; [2]SUNY Downstate, Brooklyn, NY. (Control ID #2703877)

NEEDS AND OBJECTIVES: To foster a culture of comprehensive care beyond face to face clinic visits To teach residents how to manage their patient panels through chronic disease registries To improve safe and timely follow-up for tests ordered on residents' patients

SETTING AND PARTICIPANTS: 36 internal medicine residents practicing primary care in a large urban academic ambulatory care center caring for an underserved population with high rates of multiple chronic diseases.

DESCRIPTION: A curriculum was developed to coach residents on telephonic outreach to engage high risk patients and discuss abnormal results. They used hypertension and diabetes registries to identify at risk patients. During outpatient blocks, residents were given 1–2 h of protected time per week carry out interventions under attending supervision.

EVALUATION: Residents were surveyed before and after the intervention. Residents tracked all interventions outside of clinic visits.

DISCUSSION/REFLECTION/LESSONS LEARNED: Traditionally primary care teaching is focused on individual face to face visits with patients, yet payment models are shifting towards pay for performance and population based metrics. Many practices expect providers to perform these functions on their own time, adding to a growing list of uncompensated yet high-value care. Most attendings lack formal training in population health management. Our hypothesis is that if we create a dedicated, coached, resident-preceptor session to review chronic disease measures and individual patient results, we will improve resident attitudes (adding value to the primary care continuity experience through deeper connections with patients) and behavior (ownership of patients outside of clinic visits) towards their primary care patients. This will improve resident readiness for the growing demands in population management. Prior to the intervention, 63% of residents stated they did not check in with their at-risk patients in between clinic visits. 60% of residents did not review or act upon data from chronic disease registries. Interventions focused on relationship building prevent burnout and add to patient and provider satisfaction. In addition, patient satisfaction is improved through added convenience, while expanding patient access and resident productivity. Patients appreciated that their doctors reached out to them. Residents became more selective in testing since they were responsible for follow-up. Residents reported added comfort with handling issues over the phone. For faculty, improved resident follow up on abnormal results decreased burdens on preceptors.

MOVING THE NEEDLE: IMPLEMENTING HOLISTIC REVIEW IN INTERNAL MEDICINE (IM) RESIDENCY ADMISSIONS

Katherine Lupton[2]; Sarah Schaeffer[3]; Sharad Jain[1]; Katherine Julian[1]. [1]UCSF, San Francisco, CA; [2]University of California San Francisco, San Francisco, CA; [3]University of California, San Francisco, San Francisco, CA. (Control ID #2707080)

NEEDS AND OBJECTIVES: Championed by the AAMC as key to promoting diversity in undergraduate medical education, holistic review is an individualized approach to admissions evaluation that equally considers an applicant's personal experiences, attributes, and academic metrics. The University of California San Francisco School of Medicine (UCSF) has made great strides in achieving student diversity: in 2016 30% of UCSF students identified as underrepresented in medicine (UIM). The use of holistic review in medical school admissions has played a vital role in this success. Unfortunately, these institutional successes do not extend to all levels of training at UCSF: only 15% of UCSF IM residents are UIM. As part of a multi-pronged strategy to address IM resident diversity, we formed a residency admissions task force with the following goals: 1. Implement holistic review during the initial screening of intern applicants 2. Increase the number of highly qualified UIM intern applicants interviewing for residency 3. Increase the number of UIM interns in UCSF IM residency in 2017-18

SETTING AND PARTICIPANTS: The UCSF IM residency program receives almost 2000 intern applications and admits 62 interns each year. Our task force was made up of 2 junior and 2 senior faculty with previous admissions experience.

DESCRIPTION: Using the AAMC rubric of experiences, attributes and metrics, we reviewed the applications of all 300 UIM IM residency applicants. After reviewing and ranking the UIM applicants, pairs of junior and senior task force members discussed applicants individually before making interview invitation recommendations to the Residency Program Director.

EVALUATION: Consistent with past years, for the 2016–17 UCSF IM intern class, 15% of applicants, interviewees and incoming medicine interns were UIM. For 2017–18, while UIM intern applications remained stable at 16%, after implementing holistic screening 28% of applicants invited to interview were UIM.

DISCUSSION/REFLECTION/LESSONS LEARNED: Holistic review allows a fuller understanding of applicants and their potential contributions to the learning environment and medical profession. It is a time-intensive process and is challenging to implement in a large residency program. By selectively using holistic review during the initial application screening stage, we identified many highly qualified UIM applicants who would have been overlooked using academic metrics alone as screening and almost doubled the number of UIM applicants interviewed. Holistic review holds promise to increase trainee racial and ethnic diversity at the graduate medical education level.

MULTIDISCIPLINARY IN-SITU MOCK CODES AUGMENT TEAM PERFORMANCE IN ADVANCED CARDIAC LIFE SUPPORT (ACLS). Richard Cartabuke; Adam J. Kichler. Cleveland Clinic, Painesville, OH. (Control ID #2706031)

NEEDS AND OBJECTIVES: Healthcare workers at large tertiary-care institutions have a paradoxical deficiency in preparedness to perform cardiopulmonary resuscitation (CPR) and advance life support measures immediately prior to and during cardiac arrest. The average survival rate following a cardiac arrest in the hospital is approximately 10%. Deterioration in skills is likely multifactorial and could possibly be attributed to continuous nursing and PCNA turnover in large institutions; large staff sizes limiting individual exposure to infrequent events; and the development of rapid response teams that can potentially take over the role of code leader and prevent the need to run a full code from start to finish. The use of simulation for repeated practice is one means to improve performance. The following objectives for the project are outlined as follows: Improve internal medicine trainee performance in advanced cardiac life support measures Enhance confidence in leading multi-disciplinary teams in critical situations. Augment collaboration between physician and non-physician members of the health care team. Improve patient outcomes secondary to enhanced multi-disciplinary "code" team performance.

SETTING AND PARTICIPANTS: Mock code simulations are performed on our general internal medicine floors with residents rotating through our general medicine services.

DESCRIPTION: We designed a multidisciplinary *Code Curriculum* for both physician and non-physician members of our health care team with primary focus on improving performance and collaboration in critical events. Through this curriculum, teams consistent of resident and staff physicians as well as nurses, rapid responders, respiratory therapists, and medical assistants were systematically exposed to mock codes. These on-site mock codes have occurred in a bi-weekly fashion following this project's conception, and have been implemented with the support of Medicine Institute Leadership as well as stake holders in the life support training department.

EVALUATION: Baseline data examined: the number of codes a resident has participated in during training; current PGY level; confidence level in running an arrest situation without assistance; their confidence in their colleague's ability to perform adequately during an arrest situation; the future post-graduate position and the number of mock codes they had participated in. Additionally, we began tracking participation in codes in our procedure tracking system. The post-data is being collected currently.

DISCUSSION/REFLECTION/LESSONS LEARNED: The original focus was to provide a comprehensive approach to an adult code based on simulations created by the Mock Code leadership team. The residents who participated felt that they were not receiving adequate instruction and feedback as a result of limited face-time as the code leader. As such, we began utilizing groups of 4 residents at a time and increasing the frequency that we held such sessions. This has proved to be instrumental in learner satisfaction but also has improved the learning climate.

MUSCULOSKELETAL ULTRASOUND TRAINING FOR THE INTERNAL MEDICINE RESIDENT: DEVELOPMENT AND ASSESSMENT OF A TEACHING CURRICULUM FOR ELECTIVE ROTATION Bryan Coniglio; Sean Drake; Alireza Meysami. Henry Ford Hospital, Detroit, MI. (Control ID #2702532)

NEEDS AND OBJECTIVES: Ultrasound has become increasingly utilized throughout internal medicine and its subspecialties. Musculoskeletal ultrasound is a vital tool for assessing patients with tendon and joint abnormalities, and is employed for diagnostic as well as therapeutic purposes. Internal medicine residents would benefit from using musculoskeletal ultrasound as musculoskeletal problems are among the most frequently encountered complaints in ambulatory clinic. Formal training in musculoskeletal ultrasound is largely absent from internal medicine residency programs. We sought to establish an elective rotation in musculoskeletal ultrasound for the internal medicine resident, and develop an effective teaching curriculum that could be easily implemented at other internal medicine residencies.

SETTING AND PARTICIPANTS: The course took place as part of a month-long elective rotation at an outpatient rheumatology musculoskeletal ultrasound clinic. A senior staff rheumatologist who was board certified in musculoskeletal ultrasound by the American College of Rheumatology assisted with curriculum development and led the course. Internal medicine residents from a large academic teaching hospital and from all training levels took part, including some interested in pursuing rheumatology fellowship training.

DESCRIPTION: Goals and objectives were created to reflect the six core competencies for residents in graduate medical education. A structured curriculum was developed using units with modules that incorporated book chapters, online videos, and hands-on workshops with the ultrasound, which were broken down by joint system. Residents spent time reading, observing, and practicing with the ultrasound before performing supervised examinations and interventions on their own.

EVALUATION: A pre- and post-test was administered to the residents. It consisted of multiple choice questions and ultrasound-captured images covering principles of ultrasound as well as basic musculoskeletal anatomy and pathology. An opportunity to provide course feedback was given on the post-test evaluation.

DISCUSSION/REFLECTION/LESSONS LEARNED: Feedback was very positive from the six internal medicine residents who took part in the course, and pre- to post-test scores improved by over fifty percent. Residents felt the course was a good learning experience and that its strengths were a clear curriculum, the amount of teaching and the opportunity to become comfortable using ultrasound to both understand musculoskeletal anatomy and pathology

as well as perform joint aspirations and injections. Overall, everyone indicated that the course had very good utility for the internal medicine resident. Based on our positive results and feedback, we felt the course and its curriculum were an effective means to teach musculoskeletal ultrasound to internal medicine residents.

NIGHTHAWK: MAKING NIGHTFLOAT EDUCATION AND PATIENT SAFETY SOAR Brett W. Sadowski; Hector A. Medina; William Shimeall. Walter Reed National Military Medical Center, Bethesda, MD. (Control ID #2703753)

NEEDS AND OBJECTIVES: − Demonstrate impact of evidence-based interventions designed to enhance night medicine education - Demonstrate improved patient safety as an outcome of these interventions - Address challenges with change management for residents

SETTING AND PARTICIPANTS: Internal medicine residency program at a tertiary care teaching hospital.

DESCRIPTION: Programs nationwide responded to the ACGME duty hour restrictions by implementing night medicine rotations. The patient safety impact this change has had as a result of additional provider sign-outs has been a topic of discussion that has eclipsed the discussion of the need for formal night medicine curricula. Models of night medicine education and supervision vary, often resulting in an educational void and raising potential patient safety issues. We addressed these issues by: 1. Implementing an evidence-based must-call list, in which certain clinical events prompted mandatory attending physician notification. 2. Doubling night teams from a single team (one PGY-2 or 3 resident and two PGY-1 interns) to two teams: An Admissions Team (One PGY2 or PGY3 resident and one PGY1 intern) and a Nighthawk Team (One PGY3 resident and two PGY1 interns) 3. Separating Cross-Cover duties (assigned to The Nighhawk) and ne wadmission and consult duties (assigned tot he Admissions Team) 4. Re-branding additional nightfloat rotation as “The Nighthawk”, who is accountable for the care of all admitted patients while acting in a supervisory and teaching role for the interns by running night-time educational seminars, thus enhancing intern education and resident experience and skill as teachers.

EVALUATION: The impact of the Nighthawk senior resident was estimated by daily tracking of the number of intern plans reviewed, the number of hands-on patient evaluations, and the number of educational topics discussed overnight. Over 5 months, the Nighthawk reviewed 1007 intern plans that before would have been unsupervised (approximately 15 plans per night, range 6–36) and The Nighhawk performed 200 hands on evaluations (averaging over 3 per night, range 0–12). There was a >35% increase in utilization of online nightfloat curriculum materials and an 80% increase of unique users.

DISCUSSION/REFLECTION/LESSONS LEARNED: It is commonly felt that autonomy during night medicine rotations is a powerful tool to enhance housestaff development. However, the striking numbers of Nighthawk involvement suggests a level of uncertainty that if left unsupervised, can result in adverse patient events as trainees are left to make clinical decisions without proper supervision. The variety of skill levels in trainees warrants the availability of supervision, measured assignment of autonomy, and continued educational exposure overnight. By adding a well branded supervisory role to a senior trainee, providing educational directives, and increasing the level of indirect supervision with a “must call list”, we enhanced patient safety, educational value, and housestaff commitment and enthusiasm to night medicine rotations.

NO IFS, ANDS, OR BUTTS: LEVERAGING POPULATION HEALTH TO FOCUS ON THE CARE OF PATIENTS WHO SMOKE

Jenny K. Cohen. UCSF, San Francisco, CA; Highland Hospital, Oakland, CA. (Control ID #2706265)

NEEDS AND OBJECTIVES: Smoking contributes to patient morbidity and mortality and disproportionately affects vulnerable populations. The ACGME also requires Medicine residents to learn about population health-based approaches. To address both needs, we created a multidisciplinary curriculum on smoking cessation. Objectives for our residents included practicing motivational interviewing (MI), correctly prescribing therapeutic augmentation of nicotine replacement therapy (NRT), and utilizing panel management skills. For our patients we aimed to reduce smoking rates, increase pneumococcal vaccination rates, and increase abdominal aortic aneurysm (AAA) screening. Clinic-wide we aimed to improve Behavioral Health Team (BHT) referrals and engage with our pharmacist to create a multidisciplinary curriculum.

SETTING AND PARTICIPANTS: Our intervention took place in a county primary care clinic. A pharmacist, attending physicians, and BHT created a curriculum for 1st, 2nd, and 3rd year residents.

DESCRIPTION: We worked with our pharmacist to update the pre-clinic didactic session on smoking cessation. The curriculum was reviewed with residents who were then given lists of patients in their panels flagged as smokers in the electronic medical record (EMR). Residents called their patients, confirmed smoking status, and engaged in MI. If appropriate, the residents created cessation plans including NRT, pharmacologic augmentation, and BHT referrals.

EVALUATION: Residents completed a pre/post surveys about confidence with smoking cessation counseling and clinical knowledge. Data were obtained for one clinic team prior to the initiation of the intervention: 303 patients were listed as active smokers, only one out of the 21 eligible patients had AAA screen, 13% (23/303) patients had received the Pneumovax, and 15% (23/303) were on NRT or other pharmacologic smoking cessation aid. Pre- and post-intervention data will be compared.

DISCUSSION/REFLECTION/LESSONS LEARNED: Based on our preliminary data, many patients in our practice who smoke are in need of preventative health services. Factors like limited time and provider discomfort in prescribing and getting NRT reimbursed often further stymie primary care-based smoking cessation efforts. However, we learned from our pharmacy colleagues that prescribing NRT and other therapies is straightforward and often paid for by a variety of private and public payers.

PCMH EPA’S AND THE INTERPROFESSIONAL TEAM MEETING: RESULTS FROM 5 yearS OF A NOVEL INTERNAL MEDICINE RESIDENT TRAINING EXPERIENCE Elisha L. Brownfield; Elizabeth B. Kirkland. MUSC, Charleston, SC. (Control ID #2706590)

NEEDS AND OBJECTIVES: The Internal Medicine (IM) residency community widely agrees on the need to transform resident ambulatory training ideally within highly functional ambulatory care settings incorporating

interprofessional teams. Practicing within such settings may mitigate professional burnout. The Patient Centered Medical Home (PCMH) provides a unique opportunity for such training to occur. Interprofessional, case-based team meetings focused on patient care may address the non-traditional knowledge, skills and attitudes required for successful PCMH practice and for trainee success in modern healthcare systems.

SETTING AND PARTICIPANTS: In 2012, our medium-sized Categorical IM residency training program separated inpatient and ambulatory activities using a block format. The single practice site for all ambulatory training is a hospital-based, National Committee for Quality Assurance (NCQA) certified Level 3 PCMH staffed by an interprofessional team including nursing, PharmD's, social worker and administrative support. The practice is supported by an electronic medical record and serves approximately 11,000 patients.

DESCRIPTION: Beginning January 2012, clinic faculty have led brief (40 min) weekly, case-based interprofessional team meetings utilizing the effective behaviors of team leadership as described by Salas and colleagues. Attendance by all categorical residents is required. Resident patient panels, including measures of chronic disease control, are distributed and discussed at least quarterly. Team meeting content generally falls into three categories: case review, practice process review, or resident panel review. Interprofessional teams generate implementable solutions utilizing a rapid sequence improvement process. Results have been documented since inception.

EVALUATION: The 2011 Society of General Internal Medicine PCMH Education Summit defined 25 IM resident PCMH entrustable professional activities (EPA's) using the NCQA standards as an organizing framework. Independent reviews of our Team Meeting content areas from January 2012 - December 2016 show that subject matter spanned all of the PCMH standards and the majority of EPA's. 107 separate topics were discussed over this time period.

DISCUSSION/REFLECTION/LESSONS LEARNED: Brief interprofessional team meetings are feasible in an IM resident clinic and cover all PCMH EPA's. Resident experience with each ranged from knowledge acquisition to skill demonstration. Participation from all team roles, a structured rapid sequence improvement process and tracking of results are key components of continued success.

PEER-LED LEARNER-CENTERED REFLECTION SESSIONS TO PROMOTE INTERN WELL-BEING

Evan Rausch[2]; Emmanuel A. Ghormoz[3]; Sheira Schlair[1]; Felise Milan[4]. [1]Albert Einstein College of Medicine/Montefiore Medical Center, Bronx, NY; [2]Montefiore Medical Center, New York, NY; [3]Montefiore Medical Center, Bronx, NY; [4]albert einstein college of medicine, Bronx, NY, NY. (Control ID #2704106)

NEEDS AND OBJECTIVES: Residency is the prime time in professional development to learn skills to promote well-being. Reflection sessions facilitated by peers rather than faculty are uncommon and rarely encountered in the literature. To address the need to create an open, non-judgmental venue for developing skills for resident well-being, we created peer-led, learner-centered reflection sessions focused on reflective writing and discussion.

SETTING AND PARTICIPANTS: Two PGY-2 residents created a structured, writing-and-discussion-based curriculum. One hour sessions were held during dedicated educational time. Participants included internal medicine interns at a large urban teaching hospital. Attendance was recommended but not required.

DESCRIPTION: Peer facilitators conceived, coordinated, and facilitated all sessions. There were seven to twelve intern participants per session. Faculty were not present. Each session began by describing goals and ground rules to protect confidentiality and promote acceptance. Facilitators gave a prompt and read a short writing sample before inviting interns to write for ten min. Themes related to well-being, personal expectations of residency, and burnout. After the writing exercise, peer facilitators invited participants to share their writing and/or thoughts, though this was optional. Interns completed an anonymous program evaluation at the end of each session.

EVALUATION: To date, we have conducted three sessions with a total of 29 interns. Analysis of program evaluations ($N = 29$) reveal that although only 55% of respondents had previous experience in creative writing and the mean self-assessed writing ability was 5 (1 to 10 scale; 1 = no ability; 10 = exceptional ability), 62% of participants found writing to be a meaningful way to reflect on their experiences as a doctor. 86% reported that sharing their thoughts and/or writing was a meaningful method to build a general sense of well-being. 62% reported that group discussion validated their feelings and normalized their experiences.

DISCUSSION/REFLECTION/LESSONS LEARNED: There are few published descriptions of curricula aimed at promoting resident well-being, and even fewer describing peer-led interventions. Though participants for these sessions varied with regard to writing ability and prior interest in writing, the majority found it to be a powerful means of promoting reflection. We believe the peer-led nature of the sessions normalized participants' difficult emotions and maximized sharing. The program was well evaluated. These sessions offer a structured, low cost, potentially reproducible method for promoting resident wellness that could be expanded to other programs.

PHASE III CLINICAL PRECEPTORSHIP: PERSPECTIVES FROM KEY STAKEHOLDERS

Kristin Furfari[2]; Chad Stickrath[1]; Nichole G. Zehnder[4]; Kelly White[3]; Wendy Madigosky[4]. [1]Denver VA Medical Center, Denver, CO; [2]University of Colorado, Denver, CO; [3]University of Colorado SOM, Aurora, CO; [4]University of Colorado, Aurora, CO. (Control ID #2705554)

NEEDS AND OBJECTIVES: The Foundations of Doctoring Program (FDC) is a three-year longitudinal clinical skills program that includes preceptorship. Pre-clinical preceptorship improves students' comfort and confidence with patients, enhances clinical skills, and allows application of medical knowledge. Longitudinal preceptor relationships positively influence career choice. While pre-clinical preceptorship is common in most medical schools, extension into third year is uncommon. We sought to understand the benefits and drawbacks of continuing the preceptorship program longitudinally into the third year (P3).

SETTING AND PARTICIPANTS: Information collected by survey from key stakeholders including students, clinical block directors, departmental leaders, and preceptors at the University of Colorado School of Medicine.

DESCRIPTION: To assess the value of P3 preceptorship, we sought to understand: 1. Student perception of preceptorship in the setting of concurrent traditional clinical blocks 2. The impact on students/preceptors/concurrent traditional clinical blocks 3. The best design to capitalize benefits and minimize burdens

EVALUATION: Students perceive benefit of P3 preceptorship in terms of: career exploration, mentorship, clinical and professional skill development ● 85% agreed/strongly agreed that P3 preceptorship allowed for career

exploration ● 39% chose preceptors in specialties that students are unable to explore prior to P3 ● 63% agreed/strongly agreed that P3 preceptorship allowed them to learn information not covered in clinical blocks Clinical block directors reported a positive impact of P3 preceptorship on career exploration, mentorship, advising, and student recruitment to their specialty ● 79% responded that P3 preceptorship uniquely contributed to student career exploration and mentorship

DISCUSSION/REFLECTION/LESSONS LEARNED: Survey and course evaluation data demonstrates that P3 preceptorship plays a unique role in career exploration, mentorship and advising. Students perceive benefits in clinical skills development, professional development, and self-directed learning. Students took advantage of career exploration, with 30% electing preceptors aligned with their career interests. Course redesign focused on student flexibility and identification of outcomes important to the individual student. End-of-year evaluations will be reviewed for stakeholder satisfaction and ability to accomplish program and individual objectives.

PHYSICIAN WELLNESS: BUILDING AN INITIATIVE FROM THE GROUND UP. AnneMarie Laurri[2]; Zeba Faroqui[2]; Regina Makdissi[1]. [1]State University of New York at Buffalo, Buffalo, NY; [2]University at Buffalo, Buffalo, NY. (Control ID #2703591)

NEEDS AND OBJECTIVES: Burnout among residents has become a growing concern across professional education. The prevalence within our program became apparent in an ACGME survey in 2016. It is imperative that academic medical centers have a toolkit to battle burnout and promote a culture of Wellness; one that fits the needs of their housestaff. This work is to design and build a Wellness Initiative that focuses on replicable and sustained interventions to build resilience within our housestaff. The objective is to show measurable improvement in areas of burnout as evaluated in an annual survey.

SETTING AND PARTICIPANTS: University at Buffalo Internal Medicine Residency, a program of 101 residents rotating at three clinical sites. Residents participated on a voluntary basis by completing on online survey. Of those, 59% were male and the majority between the ages of 25–30. 45% identified as Indian/Southeast Asian, 34% as Asian.

DESCRIPTION: The initial needs assessment was performed in April 2016 using the Stanford Housestaff Wellness Survey. This showed residents were lacking in both professional satisfaction and camaraderie. Many felt overwhelmed and unappreciated. Focusing here, the Wellness Initiative began in July 2016. Interventions included a 'big sib/little sib' program between interns and seniors, access to healthcare, faculty as 'Wellness Champions' at each clinical site, monthly team building events, seminars regarding time management, mindfulness, and burnout, and motivational speakers. A follow up with specific questions from the initial survey was administered with the same online tool six months after interventions began.

EVALUATION: At 6 month follow up, 58% note they can 'reach out to co-residents in difficult times' from an initial 34%. 66% feel others pitch in to help when they are overwhelmed from a previous 41%. Further, 32% reported 'a sense of dread' when thinking about work with an improvement to 23%. Similarly, 10.5% of residents felt 'callous'; now decreased to 5% - a marker of depersonalization. However, still only 11% of residents respond that 'housestaff are highly valued'.

DISCUSSION/REFLECTION/LESSONS LEARNED: In a short time, our Wellness Initiative demonstrates an impact with measurable improvement. The largest improvement was in feelings of camaraderie, influenced by the teambuilding events and the 'sibling' mentorship program. In that lies the building blocks of resilience from within. The positive change in professional satisfaction and feelings of callousness are important markers of burnout as well. This is likely related to more positive events outside the hospital, motivational speakers, and increased mentorship. More work is needed here, particularly in terms of access to mental health. Unfortunately, residents still feel undervalued - a difficult area we will need to focus on going forward, possibly related to the nature of having three distinct sites that can seem disconnected. We were able to build 'from the ground up' with accomplishable and timely interventions from very few persons.

PITTSBURGH NARRATIVES: A MULTIDISCIPLINARY WORKSHOP IN NARRATIVE MEDICINE Zachary G. Jacobs[1]; Gaetan Sgro[2, 1]. [1]University of Pittsburgh Medical Center, Pittsburgh, PA; [2]VA Pittsburgh Healthcare System, Pittsburgh, PA. (Control ID #2672546)

NEEDS AND OBJECTIVES: Narrative medicine is defined as the practice of clinical medicine using narrative competence: the skillset necessary to effectively "listen to, absorb, and be moved by the stories of illness". Training healthcare professionals in the study of narrative and literature - teaching skills such as close reading, writing, and reflection - has been shown to have benefits for both providers and patients alike, including reducing clinician burnout and increasing empathic tendencies, as well as improving patient satisfaction and clinical outcomes. The goal of this project is to develop a sustainable, multidisciplinary, collaborative workshop in narrative medicine which, through the study of literature, the practice of narrative skills, and the sharing of, and listening actively to, the stories of illness, acts to cultivate empathy and promote well-being amongst healthcare professionals.

SETTING AND PARTICIPANTS: The workshop is open to healthcare professionals of all disciplines at the University of Pittsburgh Medical Center (UPMC). Current participants include medical students, residents (both Internal Medicine and Pediatrics), and faculty members in the Department of Medicine. We are also actively recruiting members of the UPMC General Internal Medicine nursing staff to participate.

DESCRIPTION: The workshop takes place over the course of eight, hour-long, monthly sessions throughout 2016, which focus on developing a variety of narrative skills, including 1) reflective writing/storytelling; 2) close reading of literature/poetry; and 3) interpretation of film, art, and photography. The curriculum was designed to cover such themes as bearing witness to suffering, coming to terms with dying, living with chronic illness, and the isolating nature of disease, among others. Between monthly sessions, participants continue to collaborate via an online forum, where workshop leaders periodically post excerpts of prose or poetry for guided discussion, as well as prompts for reflective writing.

EVALUATION: Three validated surveys were administered to all participants prior to the first workshop session: the Toronto Empathy Questionnaire (TEQ), Abbreviated Maslach Burnout Index (MBI), and Interpersonal Reactivity Index (IRI). The same surveys will be administered at the conclusion of the series to determine whether participation in the workshop impacted tendencies toward empathy, sympathy, and burnout.

DISCUSSION/REFLECTION/LESSONS LEARNED: Early feedback from participants has been overwhelmingly positive. Preliminary data ($N = 9$) from the pre-intervention surveys suggest high baseline tendencies toward empathy (mean: 52/64), perspective taking (mean: 21/28), and empathic concern (mean: 23/28), while scores for depersonalization (mean: 2.4/18) and emotional exhaustion (mean: 6.3/18) were both low. The outcome of the workshop is yet to be determined, but the hope is to demonstrate that our curriculum improves participant empathy and sympathy while reducing burnout.

PRE-MEDICAL STUDENT HEALTH COACHING: A FEASIBLE AND INNOVATIVE PRIMARY CARE TEAM LEARNING OPPORTUNITY

Emma B. Shak[3, 4]; Sharone Abramowitz[1]; Lyn Berry[2]. [1]Alameda County Medical Center, Oakland, CA; [2]Alameda Health System, Oakland, CA; [3]Highland Hospital, Oakland, CA; [4]UCSF, San Francisco, CA. (Control ID #2703834)

NEEDS AND OBJECTIVES: The U.S. faces a critical shortage of primary care physicians (PCPs) to treat a growing population with multiple chronic conditions. Yet primary care residency programs, especially those serving low-income patients, face recruitment difficulties. We describe a project that places pre-medical students into primary care residency teams as outpatient health coaches (HCs) in an effort to develop a new generation of future PCPs with a positive experience in team-based primary care. This educational model employs physician-HC teams to engage patients in self-management skills, improve student and resident perceptions of primary care, and familiarize residents with utilizing health coaching during the clinic visit.

SETTING AND PARTICIPANTS: Our resident clinic is located in Alameda Health System's Highland Hospital, an Oakland, California public hospital serving a culturally diverse and predominantly low-income Medicaid and county-insured population. Premedical student volunteers are recruited from local colleges and trained in motivational interviewing and self-management support. Students are then teamed with two to three primary care medicine residents and/or one to two attending PCPs under the supervision of a behavioral and addiction medicine psychiatrist. The HCs were 77% minorities (Asian/Pacific Islander, African-American or Latin-American), and they ranged in age from 21 to 46 (with a median age of 25).

DESCRIPTION: We enhance the primary care team at the point of care through the addition of health coaching. The HCs spend five hours weekly in the clinic, where they: 1) observe the doctor-patient interview, 2) provide on-site health coaching to patients, and 3) engage patients in telephone follow-ups. On average, 250 patients were coached during each academic year.

EVALUATION: Anonymous surveys and feedback discussions were used to assess the impact of this educational model on 22 pre-med health coaches, their resident partners, and attendings. Of respondents, 83% of the coaches who entered with an interest in primary care remained interested in primary care. Of those who did not initially indicate primary care as an interest, 55% indicated it as a practice interest after participation. HCs reported a more realistic view of primary care medicine and felt that the experience better defined their reasons for entering medicine. They felt it was especially useful to learn from their underserved patients about the many health behavior barriers they face.

DISCUSSION/REFLECTION/LESSONS LEARNED: With the goal of creating a pipeline into primary care careers, we have found a model that may help to achieve this objective. Most students who participated in this project were positively influenced towards primary care and the underserved. In addition, residents valued partnering with HCs and gained experience participating in a modern healthcare team. Future directions include continued tracking of participants' career paths and patients' health metrics to determine the impact of HCs on clinical outcomes.

ONLINE RESOURCE URL (OPTIONAL): http://www.premedhealthcoach.com/Home.html

PRECEPTING AN INTERPROFESSIONAL CLINICAL TEAM

Johanna Martinez[1]; Lauren Block[1]; Nancy A. LaVine[1]; Daniel J. Coletti[1]; Nicole Donoghue[2]; Joseph Conigliaro[1]; Alice Fornari[3]. [1]Northwell Health, New Hyde Park, NY; [2]Northwell Health, Lake Success, NY; [3]Hofstra Northwell School of Medicine, Hempstead, NY. (Control ID #2702397)

NEEDS AND OBJECTIVES: Few formal educational programs prepare trainees to work together in interprofessional (IP) patient-centered practices; even fewer programs train faculty on how to precept these IP teams. A faculty focused two hour educational session was created to: 1) describe IP team dynamics, 2) allow faculty preceptors to complete an IP observed structured teaching evaluation (OSTE), and 3) receive formal feedback using IP precepting best practices.

SETTING AND PARTICIPANTS: Project IMPACcT (Improving Patient Access, Care and cost through Training) is a five-year HRSA funded program to enhance primary care training. All faculty preceptors completed this educational session ($n = 27$), representing the professions of medicine (18), pharmacy (4), psychology (1), physician's assistants (1) and program administrators/educators (3).

DESCRIPTION: The session included several interactive and experiential learning components. First, a "think-pair-share" exercise was conducted to contrast traditional and IP precepting. Next, a brief didactic session reviewed the evidence-based core skills of IP precepting. Finally, faculty members completed an IP OSTE with standardized learners from each of the professions. After completing the OSTE, the preceptor shared a self-assessment of their IP precepting skills and received feedback from the IP standardized learners in the group, as well as from an independent observer that utilized a structured rating rubric. The preceptor then re-practiced skills that needed improvement. The session concluded with a qualitative reflective evaluation.

EVALUATION: Participants completed 20 anonymous reflections in the learning session. Content analysis grouped responses according to 1) lessons learned, 2) remaining challenges, and 3) skill application. The comments described practical IP precepting skills learned from the session (e.g. "[I learned to draw out] the silent learners" and "learners according to his/her professional area of expertise"). IP precepting barriers identified included time pressures, organizing flow of case presentations and managing team dynamics. Observer checklist analysis revealed that preceptors often redirected their attention to the learner concordant to their profession. This was most notable among physicians, where internal medicine preceptors focused more on the medicine resident than the non-physician learners.

DISCUSSION/REFLECTION/LESSONS LEARNED: As primary care transitions to IP teams, faculty preceptors need to successfully teach and model IP teamwork for learners. Specific findings suggest continued faculty

development needs to occur to address preceptors' preferential attention to their profession-concordant learners, given an effective preceptor demands attention to all learners. Being a skilled IP preceptor is not an innate ability and takes training and continued practice.

PREPARING A PATIENT CENTERED PRIMARY CARE WORKFORCE THROUGH DIRECT OBSERVATION AND FEEDBACK: AN INTERPROFESSIONAL APPROACH Heather A. Thompson Buum[1]; Keri D. Hager[2]; Mary Dierich[1]. [1]University of Minnesota, Minneapolis, MN; [2]University of Minnesota, Duluth, MN. (Control ID #2691815)

NEEDS AND OBJECTIVES: Internal Medicine, Pharmacy, and Doctor of Nursing Practice trainees need to learn how to effectively communicate during the brief outpatient office visit. Direct observation of the patient encounter coupled with immediate feedback is necessary to improve these skills. We proposed to improve the training our learners in patient centered communication according to the IHI Triple Aim using the validated tool, the Patient Centered Observation Form (PCOF).

SETTING AND PARTICIPANTS: 1. Internal Medicine Residency: 22 residents, 8 IM faculty, 1 Primary Care Clinic at the University of Minnesota Physicians 2. Ambulatory Care Pharmacy Residency: 4 PharmD residents, 5 PharmD faculty, 3 Family Medicine teaching clinics 3. Doctor of Nursing Practice Training: 14 NP students, 14 NP faculty, 14 Primary Care Clinics

DESCRIPTION: 1. All IM, NP, and PharmD faculty were trained in the use of the PCOF via faculty development or online training. All learners were introduced to the PCOF at an interprofessional workshop. Training included a review of the tool and practice with either role play or video. 2. Direct observation of learner/patient interactions using the PCOF occured twice in 2016. The forms were then collected and collated for future reference. 3. An online survey was developed and sent to both preceptors and learners after each set of observations.

EVALUATION: Both preceptor ($N = 13$) and trainee survey results ($N = 40$) indicate that the majority (61.5%) felt the PCOF increased time in direct observation and allowed them to witness behaviors or receive feedback in areas not otherwise discussed (72.5%). Preceptors indicate increased confidence in providing feedback on communication skills (76.9%) and organizing the visit (69.2%). The majority of trainees (55%) reported increased confidence levels in agenda setting and co-creating a plan. We also analyzed the data by training program and PGY level. Statistically significant differences were noted in 1) receiving feedback not routinely discussed, 2) communicating with patients, 3) closing the visit, and 4) immediate verbal feedback. Comparing the three programs, a much lower percent agreement was noted in nursing compared to pharmacy and medicine. There were statistically significant differences in PGY level in 1) communicating with patients and 2) co-creating a plan, with the PGY1 trainees having a higher level of agreement in each item compared to PGY2 or PGY3.

DISCUSSION/REFLECTION/LESSONS LEARNED: The PCOF appears to be an effective tool to assist preceptors in direct observation and feedback of trainees regarding patient centered communication during an ambulatory visit. Survey results suggest an interprofessional collaboration around implementation can be effective for all participants, however differences in training programs and PGY level should be taken into account. Pooling together faculty and learners across programs leveraged resources and accomplished the additional goal of better understanding each other's training and expertise, as well as their role on the team for future practice.

PREPARING LEARNERS TO ADDRESS GENDER AND SEXUAL MINORITY STIGMA AND DISCRIMINATION IN GLOBAL HEALTH EXPERIENCES Jill Raufman; Viraj V. Patel; Martha S. Grayson. Albert Einstein College of Medicine, Bronx, NY. (Control ID #2701471)

NEEDS AND OBJECTIVES: Academic global health (GH) programs have grown in size and number. As students visit other cultures, they may be ill-equipped for beliefs counter to those to which they are accustomed, expressed in human rights abuses and health staff bias towards sexual and gender minority (SGM) populations. This can be dangerous for the student, offensive to the host, and can detract from the learning experience. Despite international laws requiring protection from violence and ensuring equality, there remain human rights crimes based on sexual orientation and gender identity, affecting health care access. The Global Health Center (GHC) formed a post travel session to understand SGM related issues faced by students during their GH stints and develop pre- and post- travel modules. Objectives: 1. Develop and pilot a formal debriefing for GH students witnessing and perceiving discrimination towards SGM populations 2. Provide historical and cultural perspectives on global homo- and transphobia to help ground student experiences 3. Elicit feedback and inform integration of SGM cultural sensitivity into current pre-travel sessions 4. Help learners develop strategies to ethically navigate settings where there is SGM bias

SETTING AND PARTICIPANTS: 90 students travel each year, for 4 weeks to one year, to supervised GH projects. Upon the return of some who witnessed homophobic incidents in clinical settings, the GHC held a 2 hour debriefing session with10 students facilitated by two faculty experienced in global LGBTQI health issues and medical education

DESCRIPTION: The structured session was adapted from a psycho-educational debriefing process and included 8 discussion phases about the traumatic events: 1) intros, 2) review facts about events, raising awareness of local norms and laws impacting SGM individuals, 3) elicit first thoughts, 4) elicit reactions, 5) discuss ethics, cultural humility, and human rights, 6) discuss constructive response tactics, 7) get feedback for pre-travel readiness for future learners, and 8) wrap-up. This session served as a pilot for future debriefing sessions and to facilitate integrating into our current pre-travel trainings, which include cultural humility and health care disparities.

EVALUATION: Post session, we obtained written summary evaluations from students about the structure, perceived effectiveness in helping process the events. They found it to be an effective venue for dealing with their discomfort and that having a pre-travel session would be effective for preparing future students who might face this situation.

DISCUSSION/REFLECTION/LESSONS LEARNED: Members of SGM community can be subject to health care disparities, both here and abroad. It can be very explicit in certain places with different laws regarding homosexuality. Students who are unprepared for this might react in a way that is unsafe both for themselves and their patients. Developing pre-travel programs to prepare and orient students in this area, and post travel programs to debrief can be key to successfully navigating such situations.

PREPARING MEDICAL STUDENTS FOR WORKING WITH LGBTQ PATIENTS THROUGH THE ASSESSMENT OF EDUCATIONAL NEEDS AND THE DEVELOPMENT OF AN LGBTQ HEALTH CURRICULUM IN THE DENVER HEALTH LONGITUDINAL INTEGRATED CLERKSHIP (DH-LIC) Caitlin Felder-Heim[1]; Elizabeth Kvach[2]; Kim Powell[3]; Jennifer Adams[3]. [1]University of Colorado, Denver, CO; [2]Denver Health, Denver, CO; [3]University of Colorado, Aurora, CO. (Control ID #2706585)

NEEDS AND OBJECTIVES: Despite receiving minimal education on LGBTQ health during their pre-clinical years, medical students will inevitably be involved in the care of LGBTQ patients during their clinical clerkships and beyond. A needs assessment of DH- LIC students ($n = 13$) and the faculty ($n = 34$) was conducted. Curricular gaps identified included taking a sexual history from LGBTQ patients and understanding the health care needs of transgender patients. Based on these findings, we developed and implemented a curriculum to target these topics.

SETTING AND PARTICIPANTS: The DH-LIC is a yearlong clerkship for eight University of Colorado third-year students based at an urban safety-net hospital. Students achieve competency in core disciplines simultaneously, while participating in an integrated didactic curriculum that includes the newly developed LGBTQ component.

DESCRIPTION: The LGBTQ session was developed to include an overview of proper terminology and health disparities in LGBTQ patients followed by a series of patient cases requiring students to role play and discuss patient histories. The session also included an interactive training on sexual history-taking skills. Students then watched sample videos and discussed the strengths and weaknesses each provider's sexual history-taking. The session ended with a series of short case scenarios in which the students practiced sexual history-taking in pairs.

EVALUATION: A survey was administered before and after the curriculum session to examine the attitudes towards, comfort with, and knowledge of the care of LGBTQ patients. Student satisfaction with the curriculum was also evaluated. Responses were analyzed using paired t-tests and satisfaction scores were summarized. Baseline data demonstrated that students ($N = 8$) had overall positive attitudes towards LGBTQ patients, mixed comfort in caring for LGBTQ patients, and scored on average 70% on fifteen validated knowledge questions. After the curriculum session, the collective analysis of the most negative initial attitudes demonstrated significantly increased positive attitudes ($p = 0.04$). Nearly all questions regarding skills and comfort with LGBTQ care tended to increase after the intervention, but none were statistically significant. The combined comfort scores for each participant showed significant improvement ($p = 0.01$). Knowledge scores significantly increased by a mean of 8.33% ($p = 0.004$). Students were highly satisfied with the curriculum, reporting overall satisfaction as five out of five (scale ranging 1 (dissatisfied) to 5 (highly satisfied). At the end of the year, we plan to re-administer the knowledge component of the survey to assess long-term retention.

DISCUSSION/REFLECTION/LESSONS LEARNED: An LGBTQ health curriculum within the DH-LIC was reviewed favorably by students and impacted the attitudes towards and comfort with LGBTQ care, particularly among those with least comfort at baseline. The session significantly improved knowledge of LGBTQ health care and thus was an effective intervention to improve student's ability to care for LGBTQ patients.

PRIORITIZING PATIENT SATISFACTION: A PRESS-GANEY SCORE FOR MEDICAL STUDENTS Lauren Block[2]; Judith M. Brenner[1]; Jeffrey Bird[1]. [1]Hofstra NS LIJ SOM, Hempstead, NY; [2]Northwell Health, Lake Success, NY. (Control ID #2702741)

NEEDS AND OBJECTIVES: Driven by the Affordable Care Act, the shift to value-based care is incentivizing providers and hospitals to achieve the three legs of the Triple Aim. Value-based purchasing programs place considerable emphasis on patient satisfaction, with HCAHPS and Press Ganey (PG) remaining the main indicators. It is important that medical educators train medical students to value, assess, and prioritize the patient experience. There is a paucity of curricula available to guide educators on this topic. Our objective was to develop a PG score for medical students using clinical skills assessment data as a teaching tool about the patient experience.

SETTING AND PARTICIPANTS: Ninety seven second year medical students were evaluated at Hofstra Northwell School of Medicine during the 2015–16 academic year.

DESCRIPTION: A core set of 22 clinical skills checklist items in patient care, communication skills, and professionalism was created and refined over a four-year period. Eight of nine items from the PG scale were mapped to at least one checklist item. Questions were mapped separately by two faculty members, and confirmed by a physician expert in PG and another faculty member. The checklist items were used to evaluate MS2 students in a total of 6 clinical skills stations. Checklists were completed by standardized patients (SPs) trained specifically on these measures. For each checklist item, SPs selected one of three behaviorally specific ordinal anchors. Quality control measures to ensure inter-rater reliability included review by SP trainers and quality assurance by a medical director. During the evaluation, 140 data points were generated per student. Results were obtained on the 98% of test takers who consented to participate. The student PG score was generated by calculating the average percent of students receiving full credit on the items mapped to each Press Ganey question. After the aggregate score was generated, individual scores were calculated.

EVALUATION: In the 2016–17 academic year, MS2s will receive their "Student PG Score" with peer comparison as part of a classroom session on value based care. Students will be asked to reflect on their own score and its implications. The primary outcomes of this innovation are two-fold: 1) A "Student PG Score" as a tool reflecting the patient experience, built from a student's own performance data, and 2) Student perception data on the utility of the "Student PG Score".

DISCUSSION/REFLECTION/LESSONS LEARNED: To our knowledge, this is the first description of a "Student PG Score" in the undergraduate medical education literature. The creation of a student PG score provides educators with an innovative tool in patient experience curriculum development. The score is potentially generalizable to other schools using comparable clinical skills measures. We hypothesize that providing students with safe, patient-centered feedback mirroring the type of feedback they will receive throughout their professional careers will be helpful in encouraging self-assessment and guiding professional development.

RAPID FIRE TASTY MORSELS, NAVIGATION OF THE LITERATURE LANDSCAPE Salvatore Savona[2]; James F. Lamb[1]. [1]Ohio State University, Columbus, OH; [2]The Ohio State Wexner Medical Center, Columbus, OH. (Control ID #2706410)

NEEDS AND OBJECTIVES: Provide a framework for "rapid fire" delivery of the highlights from major journals from the preceding months.

SETTING AND PARTICIPANTS: Our session is set in the ambulatory clinic location for residents. We recently expanded our reach to include inpatient teams through the use of Smart Boards.

DESCRIPTION: Each month, our ambulatory clinic hosts a journal club titled "Rapid Fire Tasty Morsels". The session occurs from 12-1pm on the final Friday of each block. The leaders of each session include our outpatient evidenced based medicine (EBM) team lead physician and a chief resident. Each session begins with three separate 6–7 min presentations by residents. Each resident is provided with an article that was published in the prior month. We send the article to the residents 1 week prior to our sessions and ask them to have an accompanying power point presentation. Articles are chosen due to their high impact on the medical literature. The next section is titled "Icing on the Cake". During this section, the ambulatory EBM lead physician and chief resident have 1 min each to summarize articles in a rapid fire exchange. There are typically 6–8 articles reviewed. Every few sessions, a section titled "Icing on Speed" is included. During this section, the titles of the articles included in American College of Phyisicians "journal club" are read, and a 1 line take away point is included. This section is followed by "Whipped Cream", which lists the titles of the articles recently published in 2–4 major journals. The final section highlights images that have been published. We often incorporate next step questions, multiple choice questions, or image interpretation for the participants. Each session typically lasts 45–50 min, and residents are provided a handout with a summary of the articles from "Icing on the Cake" and those presented by residents, as well as a list of the articles included in "Whipped Cream".

EVALUATION: Each session is evaluated by residents who attend either in person or remotely. They are asked a series of 8 questions in each evaluation. Over the past year at least 89% of responses have given us the highest possible evaluation.

DISCUSSION/REFLECTION/LESSONS LEARNED: We have presented a format for "rapid fire" delivery of high points from the recently published medical literature. All too often, trainees feel bogged down with the expansive amount of journals available. This highly interactive forum condenses a month's worth of publications into a short session, and allows for trainees to explore the literature further with a succinct framework for guidance. We feel that this style of delivery is an effective way to discuss EBM topics, as evidenced by high resident ratings of the session.

REDESIGNING THE PRIMARY CARE PRECEPTING ROOM: INTERPROFESSIONAL, REAL-TIME CONSULTATIONS TO ENHANCE COLLABORATIVE PATIENT CARE AND EDUCATION

Anna Golob[2,1]; Mary-Catherine Kane[2]; Bridget Kaufmann[2]; Katherine L. DeNiro[1]; Joyce Wipf[2, 1]. [1]University of Washington, Seattle, WA; [2]VA Puget Sound Healthcare System, Seattle, WA. (Control ID #2706956)

NEEDS AND OBJECTIVES: Primary care providers face increasing patient care and administrative responsibilities with time pressures, leading to decreased job satisfaction and higher rates of burnout. One proposed solution is transitioning primary care delivery toward a team-based, interprofessional model. Toward that end, the Seattle VA Center of Excellence in Primary Care Education (CoEPCE) aims to transform primary care education out of silos; with a shared educational curriculum for primary care internal medicine residents and nurse practitioner trainees as well as associated health professionals including pharmacists and psychologists.

SETTING AND PARTICIPANTS: We describe a recent innovation in our CoEPCE in which pharmacy residents, psychology fellows, and dermatology chief residents are now co-located with attending physicians and nurse practitioner preceptors in the Seattle VA Primary Care Clinic precepting room 1–2 half days per week. These interprofessional consultants offer real-time consultative services to internal medicine residents and nurse practitioner trainees seeing clinic patients; with a shared goal of enhancing integrated patient care and expanding trainee interprofessional learning and collaboration.

DESCRIPTION: The IP consultants engage with the primary care IM resident and NP trainees in one or more of the following ways: "Scrubbing:" the IP consultant reviews charts of scheduled patients and communicates recommendations to the trainee prior to the visit. "Staffing:" the IP consultant observes the patient presentation and provides recommendations to the trainee. "Shared appointment:" the IP consultant sees the patient along with or immediately after the trainee.

EVALUATION: Focus group evaluations of both the IM/NP trainee and the IP consultants' perceptions of the redesigned precepting room were highly positive. The psychology fellows observed that nearly half of their consultations were informal 5–10 min "staffing" interactions. They were able to model advanced communication skills and noted increased warm hand-offs for mental health conditions. Pharmacy residents cited examples of positively impacting care of chronic diseases such as hypertension and diabetes. Pharmacy and IM residents noted instances in which "scrubbing" led to improved care, such as identification of a medication error prescribed in another clinic. Dermatology chief residents enjoyed teaching problem-based skin exams and differential diagnosis. The IM residents/NP trainees reported these interactions to be highly educational, and patients voiced appreciation for the real time dermatology consultation.

DISCUSSION/REFLECTION/LESSONS LEARNED: In our experience, IP consultants are a rich addition to the primary care precepting room. Primary care trainees more frequently seek out their colleagues to help manage complex patients; and utilize skills they learn from colleagues, e.g. a pharmacist's approach to insulin titration or a psychologist's approach to motivational interviewing.

REENTRY PROGRAM FOR INACTIVE PHYSICIANS RETURNING TO PRACTICE

Nielufar Varjavand[1]; Cynthia Johnson[3]; Greco J. Mark[2]. [1]Drexel University College of Medicine, Philadelphia, PA, PA; [2]Robert Wood Johnson Medical School, Rutgers, New Brunswick, NJ; [3]Drexel University College of Medicine, Philadelphia, PA. (Control ID #2700057)

NEEDS AND OBJECTIVES: Physicians may temporarily leave practice for various reasons including career dissatisfaction and burnout, illness, disciplinary action, family issues, or to pursue other career interests. Between 1980 and 2008, the proportion of US physicians categorized as clinically inactive more than doubled from 5.5% to 12.5%. Increasingly, these physicians are being asked to complete a reentry program prior to returning to practice despite limited data about these programs. To add to the limited body of knowledge, we present findings from a survey of physicians who completed the Drexel Medicine ® Physician Refresher/Reentry Program. The objectives of the study were to obtain demographic data, understand participants' perspectives as to

whether the program allowed them to attain their professional goals, and if it removed barriers to reentry.

SETTING AND PARTICIPANTS: The program was developed in response to an increasing need for a structured path for returning physicians. Sixty-six participants completed the program between 2006 and 2013; fifty (76%) returned the study survey. Most were men (64%), between 41–59 years (78%), internists (70%), board-certified (68%) and unemployed (64%).The median number of years away from practice was 7 (0–22 years); women reported a longer median interval of inactivity compared to men (10 vs. 6 years).

DESCRIPTION: This needs-based, customized yet structured accredited CME reentry program is akin to a "mini-residency" where participants are integrated in a clinical setting of their choice amongst other learners (students, residents, fellows) and participate in rounds, clinics, small group didactics, online exercises and assessments all to enhance and evaluate their medical knowledge, communication skills, and clinical reasoning. Prior to their start, physicians identify their primary goal for participating in the program. A post-program survey asked about their perspectives on if and how the program 1) helped achieve their primary goal, 2) addressed reentry challenges, and 3) changed their practice of medicine.

EVALUATION: Overall, 37 physicians (74%) reported that they had achieved their primary goal within 12 months of completing the program. The top three goals were clinical employment, re-licensure., and refreshing skills. The majority also reported that the program prepared them to effectively resolve barriers to reentry by improving their clinical skills, confidence, and medical knowledge. It changed their clinical practice by improving their confidence, communication skills and sensitivity, and use of technology. The program also helped physicians become up-to-date.

DISCUSSION/REFLECTION/LESSONS LEARNED: This CME program provides a unique and successful model for returning inactive physicians to practice. Most achieved their individual professional goals within 12 months following program completion. For overall program improvement we added career counseling and ongoing discussions with stakeholders (boards, employers, credentialing bodies) to facilitate a smooth reentry transition.

REFLECTIVE PRACTICE WITHIN THE DENVER HEALTH LONGITUDINAL INTEGRATED CLERKSHIP (DH-LIC): A CURRICULAR SPACE TO BUILD PROFESSIONAL IDENTITY & RESILIENCE

Mim Ari[2]; michelle cleeves[1, 3]; jennifer gong[4]; Jennifer Adams[1, 3]. [1]Denver Health, Denver, CO; [2]Cook County Health and Hospital System, Chicago, IL; [3]University of Colorado, Aurora, CO; [4]University of Colorado School of Medicine, Aurora, CO. (Control ID #2700197)

NEEDS AND OBJECTIVES: Third year medical students are asked to master vast amounts of clinical knowledge while simultaneously, both implicitly and explicitly, they begin to build the foundation of their professional identity. Reflective practices support learners in exploring "possible selves" and help students identify challenges & rewards of delivering patient care, as well as burnout prevention strategies. Complimenting the clinical and didactic experience of the DH-LIC, we created a reflective practice curriculum to provide committed space to address these important issues.

SETTING AND PARTICIPANTS: Eight third-year medical students from the University of Colorado School of Medicine participate in the DH-LIC each year. The DH-LIC is a year-long immersive program based in an urban safety-net system caring for underserved and vulnerable populations. Students complete clinical core competencies across specialties simultaneously, while also participating in an integrated didactic curriculum that includes this reflective practice component.

DESCRIPTION: The reflective practice curriculum runs throughout the longitudinal experience. Students prepare essays based on four prompts: 1) social determinants of health 2) setting boundaries with patients 3) teams in health care and 4) finding closure in patient relationships. Students submit essays ahead of time to two faculty moderators and receive feedback aimed at deepening students' reflections. The student cohort and faculty moderators then meet for an open, but guided, discussion allowing students to engage with their peers and moderators.

EVALUATION: Students evaluate the reflective writing sessions during focus groups and through written course evaluations. Additionally, we have performed qualitative analysis of the recurrent themes present across essays from two program years.

DISCUSSION/REFLECTION/LESSONS LEARNED: Evaluation of the curriculum has been overwhelmingly positive. When asked how well the reflective curriculum as a whole supported students' personal and professional identity, 71% of students rated it as excellent. The remaining 29% rated it as very good. Qualitative analysis found that themes of professional identity development (80% of students) and strategies for burnout prevention (60%) were written about frequently. Faculty development, refinement of the prompts, and structured feedback to students has been key to move students from a narrative to reflective practice.

RESIDENCY CLINIC REDESIGN AND POPULATION HEALTH

Andrew Coyle[2]; mary fishman[1]. [1]Icahn School of Medicine at Mount Sinai, NY, NY; [2]Icahn School of Medicine at Mount Sinai, New York, NY. (Control ID #2699731)

NEEDS AND OBJECTIVES: Transitioning to a focus on population health can be challenging in academic residency clinics where care teams are constantly shifting. Over the last several years, Mount Sinai's IMA clinic has worked to improve the quality of overall care; however, despite intermittent didactic sessions and quarterly quality reports, relatively little attention was given by residents to the overall health of their patient panel. Our goals were to improve the health of our overall patient population as measured by core quality measures, reduce barriers to panel management among residents, and enable multidisciplinary collaboration for population health management.

SETTING AND PARTICIPANTS: Clinic is located in East Harlem, with 132 residents, 18 preceptors, 9 care coordinators, and 9 social workers. The clinic is divided into 3 Firms.

DESCRIPTION: To facilitate this transformation, the residency transitioned to an ambulatory-focused 8 + 2 model. Each Firm was divided into 3 teams with 2 faculty (with whom the residents always work), 15 residents (3 in clinic each 2-week block), 1 social worker, and 1 care coordinator. The interdisciplinary teams began meeting for an hour every Monday morning before clinic with the 3 residents on block. A standard format for the team meetings was created that included 3 components: 1) Provider review of weekly care gap reports, 2) Discussion of challenging cases by the residents, including review of high-risk patients in their panel, and 3) Case presentations by the social worker. The weekly care gap reports review all the patients who are scheduled for team providers that week and include data on ED/Hospital utilization, appointment no-shows, and whether certain core quality measures have been completed. Providers can also

arrange care coordination services for high-risk patients and can preemptively refer patients to social work when needed.

EVALUATION: A pre-survey was done with housestaff with results highlighting the need for change. Among other results, only 33% of residents strongly agreed or agreed with the statement that they "receive the needed support from social work and care coordination." Residents were also asked about their perception of their current panel, with many residents markedly over-estimating the size. At the end of the academic year, a post-survey will be done with all members of the teams to assess changes in attitudes/behaviors.

DISCUSSION/REFLECTION/LESSONS LEARNED: An initial challenge was getting buy-in from all faculty and ensuring a consistent message in each of the 9 individual team meetings. Transformation leaders initially rotated between different teams to provide oversight. The addition of SW case discussions was effective in helping to highlight social work roles and skills. Given resident concerns, we have also increased reporting frequency of quality data and panel size. Overall, the team meetings have had high levels of engagement from residents and faculty, enabling meaningful discussion of population health and panel management concepts coupled with resources and clinical support.

RESIDENT AMBULATORY PATIENT TRANSITIONS PROJECT Naomi Karlen[2, 3]; Samuel Plost[4]; Kate Hust[1]; M. D. King[2, 3]. [1]Hennepin County Medical Center, Minneapolis, MN; [2]Southeast Louisiana Veterans Healthcare System, New Orleans, LA; [3]Tulane University School of Medicine, New Orleans, LA; [4]Presbyterian Healthcare Services, Albuquerque, NM. (Control ID #2698490)

NEEDS AND OBJECTIVES: Residents are the supervised primary care physicians for hundreds of thousands of patients in academic medical centers across the country. Despite increased focus on handoffs in the inpatient setting, outpatient clinic transitions have garnered less attention. The need to address the safety of these transitions has been documented in the literature. We examined how simple resident driven interventions in the handoff between graduating and incoming internal medicine residents could affect measurable patient care outcomes.

SETTING AND PARTICIPANTS: Tulane Internal Medicine residents have a primary care continuity clinic at the Southeast Louisiana Veterans Health Care System. The average third-year resident carries a panel of 50–60 patients. Residents keep the same patient panel through all of residency, enabling successful continuity of care. Upon graduation, panels are reassigned to incoming first-year residents. This project implemented an outpatient handoff curriculum in an attempt to decrease the amount of patient care failures associated with transitioning care from graduating third-year residents to incoming first-year residents.

DESCRIPTION: Graduating residents were divided into a control group and intervention group. All groups underwent a brief training about the importance of outpatient transitions of care. The intervention group also received a hand-off bundle to use with high-risk patients (identified as having a one-year risk of death or hospitalization greater than 10% based on the Veteran Affairs care assessment need score): templated note, hand-off checklist, and dedicated time to use these items to complete a "cold" hand-off.

EVALUATION: Chart review was used to track and compare data from high risk patients during the first six months of the 2014 academic year. Using chi-squared analyses, we found that the interventions did not significantly affect hospitalization rate [control 17.5% $n=18$, intervention 17.8% $n=19$, p-value 0.957], emergency room or urgent care utilization [control 29.1% $n=30$, intervention 40.1% $n=43$, p-value 0.092], or time to primary care follow-up measured in numbers of weeks after indicated date for follow-up appointment [control 63.1% $n=65$, intervention 52.3% $n=56$, p-value 0.113].

DISCUSSION/REFLECTION/LESSONS LEARNED: Transitions of care has become a popular target for quality improvement research. Most of the literature published consists of observational data or qualitative surveys and has not studied patient outcomes related to targeted interventions. This study adds to the current literature with its unique interventional method and emphasis on patient care outcomes. While our intervention failed to significantly improve any of our measured outcomes, it identified several opportunities for future improvement.

RESIDENT DRIVEN LEAN PROCESS IMPROVEMENT FOR PATIENT CYCLE TIME, IMPROVES CLINIC FLOW AND REDUCES PROVIDER BURNOUT. Moses Lee[1, 2]; Melissa S. Lee[1, 2]; Andrew A. Chang[1, 2]; David Stevens[1, 2]. [1]Health + Hospitals Kings County, New York, NY; [2]SUNY Downstate, Brooklyn, NY. (Control ID #2707586)

NEEDS AND OBJECTIVES: Residents are typically passive participants in the design and operations of continuity practices. They receive no formal training on how to approach and solve problems in clinical flow. We aimed to: − Teach residents Lean thinking. - Engage residents in a daily practice huddle as a forum for process improvement. - Decrease resident clinic cycle time and reduce resident burnout.

SETTING AND PARTICIPANTS: A large hospital-based inner-city academic primary care practice in Central Brooklyn focused on care for the underserved. 36 internal medicine residents rotate through the resident practice in a 4 + 2 model.

DESCRIPTION: We implemented an experiential curriculum in Lean process improvement theory. Certified Lean trainers led two workshops to teach residents the Lean model for problem solving and continuous improvement and the Plan Do Study Act (PDSA) rapid cycle for testing. Residents participate in a daily scheduled interdisciplinary huddle with nurses, medical assistants, clerks, and ambulatory leaders. The prior day's cycle time (patient check in to check out) and volume is discussed and posted on the daily management board. All staff share ideas about what impacted the prior day's cycle time and propose tests of change while reflecting on efficacy of prior experiments using the PDSA method.

EVALUATION: Resident cycle time data decreased from a median of 110 min to 80 min from July to December 2016. 21/24 residents sent the survey returned it. 90% of these residents felt they had learned to use Lean to improve clinic operations. 67% stated that daily cycle time data motivated improvement in clinic flow. 76% noted that daily huddles helped address patient flow issues. Lean thinking enhanced resident satisfaction. 90% residents look forward to their primary care clinic, and 100% would recommend our practice to others as a place to work.

DISCUSSION/REFLECTION/LESSONS LEARNED: We taught Lean process improvement theory in an experiential real world setting. The curriculum succeeded as measured both by resident perception and measurable process improvement. Aided in a 4:2 model with three days per week of primary care clinic, residents and faculty could see clinic operation changes

from day to day. Huddles fostered real time discussion of acute issues. Residents identified gaps such as long wait times for patient registration, late patients, and preceptor traffic jams. Problem solving led to rapid experiments including a patient navigator to filter unappointed patients from the registration line, visual management tools to facilitate equitable patient assignment for each resident and a queue for residents waiting to be precepted.

RESIDENT EXPERIENCE DISCUSSION (RED): RESIDENT-LED DISCUSSION GROUPS TO PROMOTE RESILIENCE

Candace L. Haddox[1]; Alan Kubey[1, 2]; Hannah C. Nordhues[1]; Deanne T. Kashiwagi[1]. [1]Mayo Clinic, Rochester, MN; [2]Thomas Jefferson, Philadelphia, PA. (Control ID #2705911)

NEEDS AND OBJECTIVES: Over 50% of U.S. physicians report burnout and nearly half report dissatisfaction with work-life balance; this may be even higher among resident physicians. Institution-led discussion groups for trainees have not been shown to curb burnout scores. To our knowledge, resident-led initiatives have not been described. We sought to promote resident wellness through a resident-initiated discussion forum outside the formal residency structure.

SETTING AND PARTICIPANTS: Small groups of Mayo Clinic, Rochester Internal Medicine residents voluntarily participate in "Resident Experience Discussion" (RED) forums, hosted monthly at an attending's home.

DESCRIPTION: RED is an open discussion on topics relevant to residency training that are not addressed by formal coursework. Residents share insight, reflection, and mutual understanding of the resident experience and how it impacts life experiences. Pairs of residents and resident-nominated faculty facilitators guide sessions. Topics include difficult patient encounters, work-life balance, burnout, unmet expectations, cynicism, and favorite moments. RED opens with dinner followed by an introduction that emphasizes openness to ideas, the freedom to listen or be heard, confidentiality, and reflection on the resident experience rather than finding solutions. A resident begins with a short personal story. Then, discussion opens to all, unfolding naturally with limited facilitator guidance. After an hour, a facilitator concludes by briefly reflecting on main themes.

EVALUATION: After each RED, we surveyed residents on topic relevance, future topics of interest, positive aspects, areas for improvement (including size and meeting frequency), and nominations for future facilitators.

DISCUSSION/REFLECTION/LESSONS LEARNED: Residents have described RED as "stimulating and thought-provoking," "a truly welcoming/low pressure…frank discussion," that "[provides a] great sense of community." Faculty noted learning from the residents, gleaning understanding of their own experience. Based on resident feedback, we adjusted future topics, formatting, and facilitation accordingly to improve future REDs. Our program is growing and is extending to other Mayo residency programs. The structure and format is reproducible, and we are optimistic that residents nationally can adopt RED's framework to provide a valuable experience for their colleagues.

RESILIENCE SKILLS FOR TEAM LEADERS: A PILOT CURRICULUM FOR SENIOR RESIDENTS

Michelle Martinchek[1]; Amber-Nicole Bird[2]; Amber Pincavage[1]. [1]University of Chicago, Chicago, IL; [2]University of Pennsylvania, Philadelphia, PA. (Control ID #2694140)

NEEDS AND OBJECTIVES: Burnout is experienced by many trainees, and resilience training is one promising method to combat burnout. However, few interventions to enhance resilience in trainees have been described. Following successful implementation of an intern resilience curriculum, we conducted a needs assessment of senior residents that found they experienced difficult clinical events regularly and found them stressful. They preferred to discuss events with their teams, but had not received training on debriefing. Based on these findings, we developed and piloted an advanced resilience skills curriculum for senior residents.

SETTING AND PARTICIPANTS: University of Chicago Internal Medicine Residency Program, Post graduate year two (PGY-2) and PGY-3 residents

DESCRIPTION: The curriculum included a review of resilience skills and training on team leadership, building resilience as a team leader, and debriefing after difficult events. The sessions were led by chief residents during outpatient schedule blocks in 2015–2016. Sessions consisted of 8–15 residents and combined small group discussion, reflection, didactic lecture, and simulated skill-building exercises. Residents were surveyed pre and post-curriculum on resilience, burnout, and difficult events. Resilience was measured with the Connor-Davidson Resilience Scale (CD-RISC 25), which ranges from 0–100 with higher scores indicating higher resilience. Burnout was measured with a validated, non-proprietary single question.

EVALUATION: 62 residents participated, and the survey response rate was 66.1% pre-curriculum and 54.8% post-curriculum. The mean post-curriculum resilience score of 74.06 ± 8.66 (range 53–96) was higher although not significantly different than the mean pre-curriculum score of 70.78 ± 9.45 (range 44–93), $p = 0.12$. There was no change in the proportion of residents who scored positive for burnout before (26.8%) and after (26.5%) the curriculum, $p = 1.00$. After the curriculum, more residents reported the skills necessary to help their team cope with difficult clinical events (82.4% v. 56.1%, $p = 0.025$). 76.5% found the sessions helpful, 58.8% reported using something they learned, and 85.3% said the sessions should be continued. There were also many positive qualitative comments. Residents said they liked the sense of community and support from their peers, and that it normalized their experiences.

DISCUSSION/REFLECTION/LESSONS LEARNED: After this curriculum, residents increasingly reported having skills to help their team cope after difficult clinical events. While this curriculum did not significantly affect burnout or resilience, residents found the sessions helpful and thought they should continue. This curriculum shows promise but more in-depth interventions may be necessary to impact resident wellness.

SAFETY QUEST: A NOVEL WEB-BASED QUALITY IMPROVEMENT AND PATIENT SAFETY EDUCATIONAL GAME

Anuradha Phadke[1]; Lisa Shieh[2]; Kambria Hooper Evans[1]. [1]Stanford Healthcare, Woodside, CA; [2]Stanford Healthcare, Palo Alto, CA. (Control ID #2706822)

NEEDS AND OBJECTIVES: We designed a web-based game to teach patient safety and quality concepts to medical students and physicians. We formed a committee of leaders of medical education and patient safety/quality at our institution. Our group developed specific objectives including 1) increasing knowledge regarding communication tools to promote safety, error disclosure, and prevent healthcare-acquired infections 2) introducing learners to quality improvement and patient safety tools including root cause analysis,

A3 thinking, and error reporting and 3) reviewing high level safety concepts, such as systems engineering, reliability levels, and human factors.

SETTING AND PARTICIPANTS: We developed our game for use across graduate medical education at Stanford University Medical Center and have also made our tool freely available via the web to other institutions. In 2017 it will also be available for fee-based CME.

DESCRIPTION: Our game consists of 20 clinical cases across three levels and a bonus round. Additional resources include a tutorial and glossary. Each case contains a clinical scenario followed by a time challenge in which the learner must employ correct "safety actions" to prevent their patient from falling into harm's way. Once the player selects each of the correct safety actions in a case, they advance to a set of multiple choice questions followed by the case's "quality improvement mode," a time of advanced game play where they learn in detail about a quality improvement or patient safety tool and apply their knowledge with techniques such as matching and drag and drop. Through game play, players earn a score called "future lives saved" and "patient safety tools" to add to a virtual toolkit.

EVALUATION: We piloted our game during internal medicine intern orientation at our institution at the beginning of the 2016 academic year. We divided the incoming intern class into two groups. 19 interns played "Septris" a sepsis-educational game that our group has previously developed while 26 interns played "Safety Quest." Learners from each group participated in pre and post game-play questionnaires. In paired t-test analysis of pre and post-test data, we observed a statistically significant improvement in learner knowledge about patient safety concepts with a p-value of <0.0001 observed in knowledge testing for those interns who played Safety Quest. We did not observe this relationship in patient safety knowledge among those who played Septris.

DISCUSSION/REFLECTION/LESSONS LEARNED: We have developed a novel web-based quality improvement and patient safety game that in pre-post testing of a beta version significantly improved medical intern knowledge regarding patient safety. Developing this game has at times been challenging as the topic does not naturally lend itself to game play in the way that our previous educational game, Septris, did. However, in focus groups, learners advised us that our game was preferable to standard educational approaches.

ONLINE RESOURCE URL (OPTIONAL): http://stanfordqi.studiocypher.com/#/menu

SCHEDULING QUALITY:LEVERAGING 4 + 1 BLOCK SCHEDULING TO TEACH QUALITY AND SAFETY Megan Freeman[1]; Patricia Wathen[1]; Raj Sehgal[1]; Michael Shoffeitt[2]. [1]UTHSCSA, San Antonio, TX; [2]University of Texas Health Science Center San Antonio, San Antonio, TX. (Control ID #2694420)

NEEDS AND OBJECTIVES: Historically, internal medicine residents have rotated through a series of inpatient rotations while attending one half day per week in continuity clinic. Quality improvement and patient safety education suffer in these hurried, combined settings as they require time and attention to make their concepts real to young physicians. Changes to scheduling can be made to reconfigure learning environments while simultaneously engaging residents in hands on QI projects, patient safety, and broader systems of care, preparing them for future employment.

SETTING AND PARTICIPANTS: The internal medicine residency program at University of Texas Health San Antonio reimagined how residents work across all clinical settings, including University Health System, the Audie L. Murphy VA Hospital, and all their affiliated outpatient sites to meet these objectives.

DESCRIPTION: The residents were divided into 5 cohorts on different weeks of a 5 week schedule, 4 weeks of a rotation then 1 week of outpatient experiences. During their week of outpatient, time was protected for residents to receive training in systems of care, facilitated cohort-based longitudinal QI projects, and transitions of care time before starting their next rotation. This change made safety and QI a part of the residents' structured activities every fifth week, not an additional, ambiguous task required of them.

EVALUATION: Systems of care lectures introduced topics useful to practice, for example the Affordable Care Act, Medicare, and Medicaid. Resident cohorts complete 5 QI projects per year, some with sustained impact on clinical practice. As an example, one project decreased renal dosing errors when ordering antibiotics by 75% by creating a creatinine clearance 'pop-up.' Additionally, 98% of residents indicated participation in QI on their annual ACGME survey compared to the national average of 83%. Residents have presented results at institutional conferences and regional meetings and have rated the educational value of the curriculum by survey with a 75% response rate and a positive score of 3.9/5 for systems of care didactics, 3.6/5 for QI sessions, and 4.7/5 for transitions of care. Finally, the perception from graduating residents has been that this curriculum assists them when interviewing for future employment. Early plans are developing to conduct qualitative, structured interviews of graduating residents to evaluate this working knowledge.

DISCUSSION/REFLECTION/LESSONS LEARNED: Block schedules promote an environment ripe for education. Recurring blocks allow residents to learn safety and quality content and engage with cohort-based teams to complete longitudinal projects. Their QI projects can be better studied and implemented due to the large work force of residents in each cohort, teaching shared responsibilities and teamwork and possibly improving reception of this curriculum by learners. This model creates an educational model that gives residents a practical and working understanding of the concepts of quality and safety.

SCRIPTED TEACHING: USING TEACHING SCRIPTS AND AN ONLINE SCRIPT LIBRARY TO ENHANCE RESIDENT TEACHING IN THE CLINICAL SETTING Jennifer R. Lukela[2]; Kristin Collier[3]; Amit Gupta[1]. [1]University of Michigan Health Systems, Ann Arbor, MI; [2]University of Michigan Medical School, Ann Arbor, MI; [3]University of Michigan, Ann Arbor, MI. (Control ID #2704685)

NEEDS AND OBJECTIVES: To develop a teaching script library to improve resident teaching skills in the clinical setting.

SETTING AND PARTICIPANTS: University-based Internal Medicine (IM) and Med-Peds Residency Programs; PGY-2 through 4 residents.

DESCRIPTION: Residents play a key role in the education of medical students. Up to one-third of medical student knowledge comes from interactions with residents. Prior studies suggest students value teaching that is organized with clear take-home points, tailored to learner level, and appropriate to the clinical context. Teaching scripts can be used to facilitate high quality, evidence-based, efficient teaching in the clinical setting. Recently, we piloted a new Resident-as-Teacher (RAT) curriculum in our residency programs. Teaching scripts contain many of the features identified as high-value by learners.

Therefore, our RAT curriculum included two didactic sessions on the development and use of teaching scripts. The first session introduced residents to the importance of preparation for "spontaneous" teaching. They were provided an outline of how to draft and utilize teaching scripts in the clinical setting. Each participant developed their own teaching script. Residents then participated in a "flipped classroom" session where they presented their teaching scripts to peers and faculty facilitators, which allowed for feedback on teaching effectiveness. The flipped classroom session was later modified to include third-year medical students who provided additional feedback from the viewpoint of a learner. To encourage continued use of this model after the RAT program concluded, teaching scripts developed by participants were incorporated into an open-access library availabile to all residents within the training programs. All residents were encouraged to access these prepared teaching scripts to enhance the quality and ease of teaching within the clinical setting.

EVALUATION: Resident feedback on the program was positive.100% of residents ($n = 30$) valued the opportunity to develop and practice presenting a teaching script; 97% of residents indicated that participation in the flipped classroom session made them more likely to use teaching scripts as part of their clinical teaching in the future. Currently, our teaching script library includes 41 scripts covering 11 disciplines within IM. Since the library was launched on September 1, 2016, residents have accessed the library 147 times, making it the second most popular educational resource on our internal website.

DISCUSSION/REFLECTION/LESSONS LEARNED: Based on initial feedback, residents have been extremely satisfied with the teaching scripts sessions. Next steps include surveying residents to assess their impression of the utility and functionality of the teaching script library. We will also analyze resident teaching evaluations to determine whether resident participants in this novel curriculum receive more favorable teaching evaluations in comparsion to peers who did not participate in the RAT curriculum

SELF-REFLECTION AND PEER OBSERVATION: A NOVEL FACULTY DEVELOPMENT TOOL Shanu Gupta; Aliyah Sadaf. Rush University, Chicago, IL. (Control ID #2707592)

NEEDS AND OBJECTIVES: Peer observation has been described in the literature as a valuable tool to assess teaching performance. We describe a novel tool for using peer observation for self-reflection as a form of faculty development.Our objectives: Self-reflect on current teaching practices Create a continuous quality improvement process for junior faculty teaching practices Create a community of teachers through peer mentorship

SETTING AND PARTICIPANTS: Junior faculty in the Division of Hospital Medicine at an academic institution.

DESCRIPTION: In our model,junior faculty are invited to join the Peer Observation project and asked to self-evaluate their teaching practice and identify areas for improvement.They then observe a colleague as they lead their teaching rounds. Following the observed rounds, participants write their observations and engage in a focus group. At the conclusion of the discussion, participants commit to implementing a new strategy to their teaching practice. Four to six weeks later, participants are asked to repeat the cycle of self-reflection and peer observation followed by a focus group.

EVALUATION: Our goals were to provide a self-reflective environment that is conducive to creating a teaching community that serves as a platform for continuous quality improvement for personal teaching practices. As such, we chose not to evaluate teaching practice outcomes. From our initial observations, this model for peer observation has proved successful in creating a non-threatening environment where educators feel valued and have an avenue to voice their needs. All of our participating junior faculty members chose to continue in this project in this academic year. In addition, all participating faculty have become peer mentors for incoming new faculty in an effort to on-board them into their new educational roles.

DISCUSSION/REFLECTION/LESSONS LEARNED: Teaching on the wards not only provides a platform for dissemination of knowledge, but is also an evaluative measure for overall faculty performance. Teaching performance is measured through learner evaluation, and this often also serves as feedback for faculty. Much of the teaching performance development is done through faculty development seminars, workshops and other longitudinal programs. One way to help develop teaching practices is through peer observation. In a 2006 study of General Practitioner teachers showed reluctance in participating in the peer observation process due to time constraints, busy workloads, and fear of scrutiny and criticism. As a result, we devised a program for junior faculty that provides an observation platform coupled with self-reflection. Our success so far lies in creating a community of educators within our division. Our weakness has been time and heterogeneity of experience. However, group discussion with some more senior faculty input has helped foster rich discussion. What we have yet to do is find ways to incorporate participation in teaching self-reflection as a quality metric for academic hospitalists, for example as part of a 360 faculty evaluation.

STRENGTHENING MEDICAL STUDENT SUBSTANCE USE DISORDER (SUD) MANAGEMENT SKILLS THROUGH DEVELOPMENT OF A MULTI-MODAL CURRICULUM WITHIN THE DENVER HEALTH LONGITUDINAL INTEGRATED CLERKSHIP (DH-LIC)

Sarah Axelrath[2]; Jennifer Adams[1, 3]. [1]Denver Health, Denver, CO; [2]University of Colorado School of Medicine, Denver, CO; [3]University of Colorado, Aurora, CO. (Control ID #2702729)

NEEDS AND OBJECTIVES: Overdose deaths have nearly quadrupled since 1999 (CDC) and trained physicians are needed to address this growing health crisis. In a needs assessment of third year medical students and faculty preceptors participating in the DH-LIC, only 27% of students reported a high level of comfort with management of SUD despite 75% of faculty rating this skill as important. Based on these results, an educational innovation was developed with the objectives to increase student knowledge and comfort with management of SUD, improve student attitudes toward patients with SUD, and strengthen student resilience in working with this challenging population.

SETTING AND PARTICIPANTS: The University of Colorado School of Medicine's DH-LIC is a year-long curriculum in which 8 third year medical students complete all core clerkships simultaneously at the only dedicated safety net hospital serving metropolitan Denver. Similar to other urban areas, the average prevalence of SUD for adults in this catchment area is 11.9%, versus 9.0% in the US (SAMSHA).

DESCRIPTION: This innovation consists of a longitudinal, multi-modal curricular thread woven into the DH-LIC, combining team-based learning (TBL), traditional didactics, communication workshops, reflective writing, and clinical experiences in SUD. These components are integrated into the core curriculum, allowing progressive development of student knowledge and skills across medical specialties and settings.

EVALUATION: In pre-curricular surveys assessing student knowledge and attitudes, less than 50% of students correctly answered any question about pharmacotherapy for SUD and no students expressed strong satisfaction in working with SUD patients. At completion of the year-long curriculum, follow-up surveys and student self-assessment of comfort with management of SUD will be used to measure curricular efficacy. To date, 100% of students have reported 5.0/5.0 satisfaction with didactic sessions and TBL cases, and students rated their clinical experience and related reflection as 4.9/5.0 in terms of its positive effect on their attitudes toward patients with SUD.

DISCUSSION/REFLECTION/LESSONS LEARNED: Weaving SUD content into a longitudinal curriculum provides the opportunity for students to reflect on their experiences and attitudes as they develop. Following a clinical experience at a local syringe access program, one student wrote: "I questioned my own beliefs surrounding IV drug users. I don't want them to think that they are a bad person for having an addiction." Exposing trainees to challenging patients and situations is important for building resilience that allows students to advocate for the underserved.

STUDENT/EXPERT AGREEMENT OF USEFULNESS OF FACULTY FEEDBACK Alan L. Hull[1]; Neil Mehta[2]; Amy S. Nowacki[1]. [1]Cleveland Clinic, Cleveland, OH; [2]Cleveland Clinic Lerner College of Medicine, Cleveland, OH. (Control ID #2701433)

NEEDS AND OBJECTIVES: In our competency-based assessment system students must use formative assessments to self-regulate their learning and document competency achievement based on useful narrative feedback from facutly. We have a web-based Clinical Assessment System (CAS) where faculty provide timely formative feedback based on observed encounters. We enhanced CAS so usefulness of the feedback is assessed by students. Our project goal was to refine the usefullness scale to maximize agreement of feedback ratings from 2 physician educator faculty (experts) with student ratings using 2 student cohorts. We achieved the following objectives: 1) In an exploratory study, determine if ratings could be combined into fewer categories and determine the agreement of student ratings with expert ratings. 2) In a second confirmatory study, refine and confirm the findings.

SETTING AND PARTICIPANTS: The IRB-approved study includes students rotating through 9 core clerkships offered in 4 affiliated medical centers. The analysis used 40 blinded randomly-selected forms from those completed by 48 students from 7/2013 to 12/2013 . The confirmatory analysis used 100 blinded randomly-selected forms from those completed by 59 students from 7/2016 to 12/2016.

DESCRIPTION: Students read the faculty assessments on-line; prior to leaving the feedback screen students can respond using a 5-level agree score to: "The form identifies specific behaviors/skills that I did well and/or I can improve upon." Student ratings are not shared with faculty yet.

EVALUATION: The study categorized forms into 3 levels (agree, neutral, and disagree). There was *good* agreement between the 2 experts (Kappa .72, 95% CI = 0.58–0.87). However there was *poor* agreement (.10 and .09) comparing each expert to student ratings. There tended to be more agreement between experts and students when experts rated the feedback as not useful. A confirmatory analysis was conducted to study this trend. There was *moderate* agreement between the 2 experts (.48, 95% CI = 0.35–0.61). The experts developed a consensus rating adjudicating differences. There was *fair* agreement between the consensus ratings and student ratings. Since student ratings were skewed towards useful, we created a 2-point useful/non-useful score. Using this scale students and experts agree 97% when the student rating was useful but 35% when the student rating was not useful.

DISCUSSION/REFLECTION/LESSONS LEARNED: Students and experts have fair agreement when feedback is useful. We conclude that we can use student ratings to recognize faculty. But agreement about what is not-useful is less clear. Disagreement could be due to students rating faculty feedback more favorably (85% of student ratings versus 63% of expert ratings) or that students use other factors (eg concurrent verbal faculty feedback), thus experts may not have the whole picture. Experts agreed with students in 13/15 non-useful ratings (87%), but only in 61/85 useful ratings (72%). Including ratings from students not receiving verbal feedback may increase the proportion of non-useful ratings by students.

STUDENTS AS SYSTEMS ETHNOGRAPHERS: ADDING VALUE TO HEALTH SYSTEMS AND ENHANCING LEARNING IN HEALTH SYSTEMS SCIENCE Jed Gonzalo; Deanna Graaf; Lawrence Kass; Susan Promes; Daniel R. Wolpaw; Daniel R. George. Penn State College of Medicine, Hershey, PA. (Control ID #2702438)

NEEDS AND OBJECTIVES: To better align education with health care transformation, educators have recommended an increased focus on Health Systems Science (HSS), and related higher-order competencies of ethnography and systems thinking. Ethnography is the process of observing and "writing" culture, and systems ethnography refers to the process of observing systems of care to uncover vulnerabilities and leverage points for change that can improve quality. Our objectives were to: (1) Design systems ethnography roles for medical students that add value through the identification of vulnerabilities in care delivery, and, (2) Enhance student learning in HSS.

SETTING AND PARTICIPANTS: In the Fall 2016, we implemented a program for a subset of 1st-year medical students who were educated about ethnography and systems thinking, and linked with patients during admission in the Emergency Department (ED) to observe the patient experience and clinical processes. Experiences were contextualized in a longitudinal HSS course. Student mentors in the ED included nurse managers, care coordinators, and physicians.

DESCRIPTION: Fourteen students participated in the program, spending 12–15 hours in the clinical environment to ethnographically observe and apply a systems thinking lens to patient experiences and processes. Students were linked with patients in the waiting room, through triage, throughout their ED stay and during the discharge process or hospital admission. Students logged their observations and reactions using a structured format. Qualitative methods were used to analyze assignments and notes.

EVALUATION: Students submitted written assignments, participated in a debriefing, and completed an electronic survey regarding educational benefits and perceived value added to the clinical mission using 5-point Likert-scale questions. Students identified one overarching theme - patient's prolonged waiting amidst the hectic ED. Four categories of vulnerabilities were identified: (1) patient experience, (2) communication/collaboration, (3) processes, physical space, and resources, and, (4) professionalism. Students reported improved appreciation for patient challenges (3.92/5), importance of communication (3.92/5), and understanding of the patient experience (3.77/5).

DISCUSSION/REFLECTION/LESSONS LEARNED: Systems ethnography experiences for medical students can provide unique educational opportunities while simultaneously highlighting areas for improvement in the clinical environment. Despite logistical challenges, these authentic, meaningful workplace roles promise to add depth to classroom learning in interprofessional collaboration, value, and population health.

SUBSPECIALTY TRAINING IN A PRIMARY CARE RESIDENCY TRACK Joan Addington-White[2]; Vidthya C. Abraham[1]. [1]University of Wisconsin Hospital and Clinics, Middleton, WI; [2]University of Wisconsin-Madison, Madison, WI. (Control ID #2707271)

NEEDS AND OBJECTIVES: To meet the growing need for primary care physicians, academic medical centers must determine how best to educate residents to practice general internal medicine (GIM). Although there is increasing emphasis on the outpatient setting, subspecialty training during residency largely remains an inpatient experience and is less focused on content a primary care physician will need for practice. We developed a clinic block rotation that incorporates subspecialty clinic training focused on the educational goals of the developing general internist. The objectives of the rotation are to provide residents with skills to manage complicated patients in practice, recognize when subspecialty referral is necessary, and to individualize a resident's training based on future goals.

SETTING AND PARTICIPANTS: All primary care track residents and graduates from the University of Wisconsin- Madison were participants.

DESCRIPTION: Subspecialists with excellent teaching evaluations and a commitment to training residents to become strong general internists were recruited. Working with these physician-educators, core concepts that a general internist would need to master to appropriately diagnose, treat, and refer in each of the subspecialty areas were identified and objectives were jointly formed. The rotation was designed as an 8 week block for PG1s and a 12 week block for PG2s and PG3s. During each week of the rotation, residents spend two half-days in their continuity clinic and seven half-days rotating through different subspecialty clinics. Over the course of three years, each primary care resident experiences a similar foundation of subspecialty clinics, but are also placed in subspecialty clinic experiences unique to their own interests and future goals.

EVALUATION: Over the past 6 years, all primary care residents surveyed prior to graduation (22 to date) rated the primary care block among their top three learning experiences during residency. Since the track's inception, 82% of graduates have pursued careers in academic and community primary care. A recent email survey to the 18 graduates currently practicing in primary care queried their experiences in the subspecialty clinics. Of the 14 who responded, 12 (86%) strongly agreed and two (14%) agreed that "rotating through the subspecialty clinics helped prepare me for practice after residency."

DISCUSSION/REFLECTION/LESSONS LEARNED: Subspecialty training is critical for developing excellent general internists. Since 2008, we have created more than 40 discrete clinical half-day experiences and recruited an equal amount of highly ranked subspecialty faculty educators. Our graduates tend to remain in primary care at averages that exceed those published in the literature. They all report that the subspecialty block rotation has helped prepare them for their careers as general internists. Recruiting strong subspecialists, creating focused objectives for GIM, individualizing the resident experience, and making adjustments based on regular feedback have been key to the success of this rotation.

SWITCHING THE FOCUS FROM KNOWLEDGE TO PRACTICE: IMPROVING RESIDENT PARTICIPATION AND CONFIDENCE IN INTERDISCIPLINARY QI PROJECTS Elena Lebduska[6]; Amar Kohli[1]; Natasha Parekh[3]; Erika L. Hoffman[5]; David C. Demoise[7]; Carla Spagnoletti[2]; Jaishree Hariharan[4]. [1]UPMC, Mars, PA; [2]University of Pittsburgh, Pittsburgh, PA; [3]University of Pittsburgh Medical Center, Denver, CO; [4]University of Pittsburgh Medical center, Pittsburgh, PA; [5]VAPHS/Univeristy of Pittsburgh, Pittsburgh, PA; [6]University of Colorado, Denver, CO; [7]UPMC, Pittsburgh, PA. (Control ID #2706694)

NEEDS AND OBJECTIVES: The ACGME recognizes that internal medicine trainees must achieve competence in systems based practices. With many residency programs going to an inpatient/outpatient "block system", achieving continuity for quality improvement (QI) projects in the outpatient setting becomes a challenge. With this in mind, we implemented an educational QI initiative with a three part aim: 1) Increase resident participation in QI projects in the outpatient setting; 2) Improve patient level chronic disease outcomes measures; 3) Evaluate resident confidence in interdisciplinary QI projects. This abstract will focus on the last aim.

SETTING AND PARTICIPANTS: Participants were the 140 residents affiliated with the University of Pittsburgh Medical Center during two academic years (2014–2016). All residents followed a panel of continuity patients in one of three clinical sites: a university clinic ($n = 52$), a community clinic ($n = 36$) and a VA clinic ($n = 52$).

DESCRIPTION: The focus of our curriculum was on using a longitudinal, multistep, innovative approach to teach QI by focusing on single area patient level outcomes. This stepwise approach included: a brief QI didactic, individual chart reviews, resident-driven team interventions, interdisciplinary QI councils, process evaluation, and consistent data transparency and re-evaluation.

EVALUATION: Curricular evaluation during the pilot year (2014–2015) involved analysis of ACGME resident response data. The national ACGME resident responses from pre-curriculum in spring 2014 were compared to responses in spring 2015. With regard to the questions, "Participated in Quality Improvement" and also "Provided Data about Practice Habits", residency responses increased from 83% to 87%, and 67% to 76% respectively. During the second curricular year (2015–2016) residents were surveyed pre and post curriculum and paired T-tests were used to evaluate responses at the university and community hospital resident clinics. There were 88 total pre-tests, 65 total post-tests, and 56 paired tests. Responses were based on a 5 point Likert scale from not confident to very confident. Post curriculum residents reported improved confidence in: creating a successful QI project, working in an interdisciplinary QI team, applying a PDSA cycle, improving the management of chronic disease patients, and reviewing patient level quality metric data (<0.01).

DISCUSSION/REFLECTION/LESSONS LEARNED: This is a team-based educational initiative to teach residents about QI, utilizing an innovative stepwise approach. To date, the initiative has successfully engaged 140 residents in the QI process, and has fostered collaboration between residents and clinic staff. It has led to improved participation in QI projects, as well as improved resident confidence with QI principles and interdisciplinary care.

Moving forward we plan to evaluate interdisciplinary team members' responses to working with residents on longitudinal QI initiatives.

SYSTEMS ENGINEERING COLLABORATION TO ANALYZE INTERNAL MEDICINE RESIDENCY

James Benneyan[1]; Margo Jacobsen[1]; Awatef Ergai[1]; Ryan Gurney[1]; Sophie Silverstein[1]; Paul Han[2]; Leo B. Waterston[2]; Thomas E. Van der Kloot[2]; Robert Bing-You[2]; Peter W. Bates[2]. [1]Northeastern University, Boston, MA; [2]Maine Medical Center, Portland, ME. (Control ID #2698159)

NEEDS AND OBJECTIVES: Care delivery and graduate medical education (GME) are complex, variable, and intertwined; systems engineering (SE) methods analyze, optimize, and improve complex processes. We proposed a collaboration between SE and GME researchers to improve the interprofessional clinical learning environment (CLE) by using structured SE methods to assess current processes and prioritize CLE education and care improvement opportunities.

SETTING AND PARTICIPANTS: A four month pilot project was conducted by the internal medicine residency program at Maine Medical Center (Portland) and the Healthcare Systems Engineering Institute (Boston). The MMC program has 47 residents and 225 attending physicians.

DESCRIPTION: Starting with stakeholder interviews and process observations, the research team assessed the current state of IM residency via four SE methods used in complex industries such as aviation and manufacturing: (1) Process maps help understand work flows and roles of day-to-day processes. (2) Systems Engineering Initiative for Patient Safety (SEIPS) analyzes the larger context within which these work flows and interactions occur. (3) Failure Mode and Effects Analysis (FMEA) helps identify and prioritize potential process failures. (4) Functional Resonance Analysis Method (FRAM) studies the resiliencies and interdependencies of activities in complex systems.

EVALUATION: These tools combined provided insightful information to guide process redesign. Process maps illustrated the general flow of resident activities and the high variation within and between days. SEIPS analysis identified five primary areas of concern that can lead to burnout or sub-optimal patient care: heavy workloads, lack of communication, lack of reflective learning, training variability, and inefficient information exchange. FMEA identified 18 primary failure modes with 21 effects and 43 causes. More care-related failures than learning-related failures were identified, the former rated also with higher severity. The most severe of these were categorized as communication, schedule, and interruption failures. Finally, FRAM highlighted inter-dependencies between GME functions, potential improvements, and work-as-imagined versus work-as-done differences.

DISCUSSION/REFLECTION/LESSONS LEARNED: SE methods add additional value to GME improvement and redesign activities. Results of this study collectively have helped inform, prioritize, and plan inpatient internal medicine GME redesign activities, provided a structured framework to guide these efforts, and introduced new process analysis methods.

TAKING SGIM'S "TEACHING EDUCATORS ACROSS THE CONTINUUM OF HEALTHCARE" ON THE ROAD - A LOCAL, INTERPROFESSIONAL FACULTY DEVELOPMENT INNOVATION

William G. Weppner[3]; Andrew P. Wilper[5]; India C. King[2]; Melissa (Moe) Hagman[1]; Lisa Inouye[3]; Amber Fisher[1]; Rick Tivis[1]; C. Scott Smith[3]; Christopher Knight[4]. [1]Boise VA Medical Center, Boise, ID; [2]Boise VAMC, Boise, ID; [3]University of Washington, Boise, ID; [4]University of Washington, Seattle, WA; [5]University of Washington School of Medicine, Boise, ID. (Control ID #2706086)

NEEDS AND OBJECTIVES: Interprofessional education is important for health care trainees. In addition, programs desire sustainable faculty development opportunities to improve their quality of teaching. To address these purposes, we implemented a local version of SGIM's national TEACH (Teaching Educators Across the Continuum of Healthcare) at our institution.

SETTING AND PARTICIPANTS: Our institution hosts training programs for Internal Medicine, Family Practice, Psychiatry, Nurse Practitioner, Psychology, Pharmacy, and Nursing; faculty from these programs were invited to attend.

DESCRIPTION: In collaboration with national TEACH faculty, we modified the TEACH certificate program for our interprofessional faculty. Over an academic year, we provided a full-day faculty kick-off, monthly in-person teaching seminars, monthly in-person (or virtual) journal clubs. Participants were required to attend the kick off and 5+ seminars and 5+ journal clubs; complete 6+ peer teaching observations, and a teaching philosophy. Mentorship was organized between professions, while journal club topics were divided up among each profession. Lectures were provided by invited guests that instruct as part of the national TEACH program.

EVALUATION: 35 faculty members attended the day-long retreat, with a stated goal of completing TEACH training; of that, 24 completed the requirements (69%). Faculty represented included internal medicine ($n = 15$, 42.9%) and related subspecialties ($n = 5$, 14.2%); pharmacy ($n = 7$, 20%); nurse practitioner ($n = 3$, 8.6%); psychology ($n = 3$, 8.6%) and psychiatry ($n = 2$, 5.7%). End-of-year survey respondents reported having a mean of 5 observed teaching sessions with faculty feedback (range 0–10, SD 2.5). Self-reported satisfaction indicated greatest improvement in small group settings, followed by large group settings and teaching with the patient present. 86% of survey respondents indicated that TEACH had a moderate or a large impact on their personal development. Trainee ratings of TEACH faculty teaching ratings compared to non-participating faculty was only available for a subset of internal medicine faculty; there were no differences of already high ratings between the year prior and the year of the curriculum. Qualitative data in the form of thematic analysis of 75 statements from a semi-structured end-of-course focus group was performed, with an interclass correlation coefficient of 0.98 after four rounds of review. Of seven classes identified, *feedback* (19% of statements) and *deliberate teaching practice* (21% of statements) were prominently featured as important aspects of the course.

DISCUSSION/REFLECTION/LESSONS LEARNED: This faculty development effort appeared effective and sustainable. Key elements in the adaptation of SGIM's TEACH format include encouraging peer feedback, encouraging deliberate practice regarding teaching strategies, and adapting it for an interprofessional audience.

ONLINE RESOURCE URL (OPTIONAL): http://boisevacoe.org/products/teach/

TEACHING AND LEARNING ROUNDS: DESIGNING A FACULTY DEVELOPMENT COURSE USING ELEMENTS OF THE LEARNING ENVIRONMENT

Michael McShane[1]; Hugo Torres[1]; Priyank Jain[2]. [1]Cambridge Health Alliance, Somerville, MA; [2]Cambridge Health Alliance, Cambridge, MA. (Control ID #2700377)

NEEDS AND OBJECTIVES: The most successful faculty development (FD) programs involve teachers in learning activities similar to ones that they will use with their students: a "learning by doing" strategy. Yet, FD programs in medical education tend to be contradictory to major research and theory behind learning: workshops are rarely longitudinal, they present superficial information, they do not target the needs of teachers, and mainly use didactics (Bransford, 2000; Leslie, 2013). We set out to create a year-long longitudinal FD course for internal medicine teaching attendings at a community teaching hospital, grounded in educational theory. The goal is to create a FD curriculum that is learner-centered, community-centered (Bransford, 2000), and helps our faculty to grow professionally.

SETTING AND PARTICIPANTS: We organized monthly 60-min session with voluntary participation.

DESCRIPTION: We based the course within a constructivist epistemology, creating sessions that are: experiential (Dewey, 1986), social (Vygotsky, 1980), include observation, reflection, and action, and based on preexisting understandings and knowledge (Piaget, 1952). Each session was structured around a clinical learning environment artifact (resident notes, evaluation forms, bedside teaching, etc.). A facilitator guided the participants in describing and analyzing the artifact, sharing of interpreted challenges faced by the creator of the artifact, and sharing solutions. Each session ended with built-in reflection about participants reaction to the exercise. We mapped the artifacts and activities with institutionally predetermined behaviors expected of a teaching attendings.

EVALUATION: Our evaluation focuses on our three main objectives. First was to create a learner-centered course. As a product of an experiential process, the group would explore relevant topics which would be based on their own prior knowledge and expertise and would meet their needs. We recorded these concepts. Second was to create a community-centered course which was evaluated by reviewing "best practices" shared by faculty during the session. Finally, our third objective was to create a course that allowed our faculty to grow professionally, which will be evaluated by an end of course survey about change of practice perceptions.

DISCUSSION/REFLECTION/LESSONS LEARNED: Initial qualitative data indicate that participants acquire three types of content. First, faculty learn and share discrete teaching tips and best practices, which are compiled in a Google document that can be accessed online. Second, the sessions create a sense of community; faculty regard the exercise as a "safe space" to explore best practices at our institution and ways to improve their own teaching. Finally, faculty recognize and explore the critical concepts behind our learning objectives. One participant in our third session noted, "It became apparent to me when I was reflecting on the exercise that I know myself better as a learner…I can train myself to understand how another person learns by asking them to reflect on a learning exercise."

TEACHING ASYLUM MEDICINE: FIVE MODELS FOR ALIGNING DEMAND AND RESOURCES AT YOUR INSTITUTION Katherine C. McKenzie; Dennis Wang. Yale School of Medicine, New Haven, CT. (Control ID #2697892)

NEEDS AND OBJECTIVES: In 2015, 65 million individuals were displaced from their homes due to human rights abuses, torture and persecution and more than 172,000 individuals applied for asylum in the United States. A medical forensic evaluation of asylum seekers who report torture or ill-treatment can increase the likelihood of a successful asylum case. Many clinicians are interested in performing medical evaluations of asylum seekers, however resources and demands at academic institutions vary substantially. Some clinics are sent ample referrals to meet trainee requests and have abundant faculty support for supervisions. Other clinics have few trained supervisors and a small refugee referral network. Using one of the models described, clinics can tailor their approach to their institution's unique needs.

SETTING AND PARTICIPANTS: Asylum clinics receive referrals for medical forensic evaluations from immigration attorneys and human rights groups. Trained faculty provide supervision to clinicians in training.

DESCRIPTION: *Model 1*: *1–2 trainees in the exam room* Benefits: Direct interaction between the trainee and client Limitations: Small number of trainees; increased risk of re-traumatization of the asylum seeker *Model 2*: *Multiple trainees observe from an adjacent room* Benefits: Larger number of trainees can observe; Decreased risk for re-traumatization of the client Limitations: No direct interaction *Model 3*: *Detention facility* Benefits: Direct interaction; exposure to detention facility conditions Limitations: Transit time may be prohibitive; facility may not allow trainees; clinical space not ideal; dependent upon proximity to a detention facility *Model 4*: *Formal medical school course* Benefits: Classroom-sized group; in-depth didactic teaching of the field Limitations: No direct interaction ; requires time in the formal curriculum *Model 5*: Group discussion with applicant who has been granted asylum Benefits: Large group; direct interaction with asylee; asylee can discuss the entire process Limitations: Not a forensic medical exam

EVALUATION: Results from evaluation of model 2 show that participants find it to be a worthwhile learning experience, although many would prefer to be involved in direct evaluation of the asylum seeker. Papers evaluating programs similar to models 1 and 4 demonstrate significant satisfaction from participants. To our knowledge, a quantitative evaluation of the small group and detention model has not yet been performed, nor have studies been done to compare the 5 models.

DISCUSSION/REFLECTION/LESSONS LEARNED: There is not one ideal model that meets the needs of teaching asylum medicine in all clinics. Resources such as faculty support, clinical space and proximity to a detention center vary. Demands for evaluations will be dependent on pool of asylum seekers in the area. Students, institutions, asylum seekers and faculty have different capacity to accommodate and commit to teaching and learning asylum medicine. Awareness of different models from which to choose allows a medical school to find the one that best serves its student's needs.

TEACHING TRAINEES HOW TO PROVIDE TEAM-BASE PRIMARY CARE THROUGH TELEHEALTH MODALITIES Sarai Ambert-Pompey. Boise Veterans Affairs Medical Center, Boise, ID. (Control ID #2706530)

NEEDS AND OBJECTIVES: Team-base primary care to rural and underserved areas is an important goal of health care systems. Clinical Video Telehealth (CVT) can provide care to remote areas but there are limited training opportunities. Our goal is to expose interprofessional (IP) trainees to team-base primary care through CVT.

SETTING AND PARTICIPANTS: The Boise VA Center of Excellence for Primary Care Education is home to IP health care training for Internal Medicine (IM), nurse practitioners (NP), and pharmacy residents, and post-doctoral psychology fellows. The Boise VA is also the Telehealth Hub for the northwest

region, providing care for veterans in the state of Alaska, Washington, Oregon, and Idaho.

DESCRIPTION: CVT has been incorporated into ambulatory care training for IP trainees starting with a half-day introduction class to learn about CVT technology and safety. This includes dedicated time for certification, including a skills test. The trainee has at least another half-day clinic to participate in the clinic's team-base huddle seeing patients with a faculty provider. The IM and NP resident can direct the nursing staff to aid with the physical exam with the equipment, including otoscope, auscultation device, and high definition camera for closer inspection. Psychology fellows use CVT for visual cues and non-verbal communication. Pharmacy residents use CVT in combination with subsequent telephone appointments, and use clinical registries.Virtual warm hand-offs are modeled between professions.

EVALUATION: Since 11/2015 to 12/2016, we had 17 trainees do a telehealth rotation, 9 IM, 2 NP, and 4 pharmacy residents and 2 psychology post-doctoral fellows. A survey was sent to each trainee following completion. 12 out of 17 surveys were completed for 70% response rate. The post-training survey data is limited by small sample size, but the trend suggests CVT skill competence increasing from underdeveloped to competent, with interest in performing CVT increased from neutral to positive. One trainee expressed enough interest to pursue a permanent position in telehealth. All the trainees that completed the survey requested more telehealth training experiences.

DISCUSSION/REFLECTION/LESSONS LEARNED: Team-based telehealth experiences can be provided to IP trainees; it appears this is a welcomed opportunity. Lessons learned include that all the IP trainees have interest in more telehealth experiences. Future considerations include increasing the rotation to a continuity care clinic for the trainees and offering specialty CVT clinic exposure with trainees on the patient side tele-presenting to a specialty provider at a distant site.

TEAM-BASED LEARNING (TBL) IN THE DENVER HEALTH LONGITUDINAL INTEGRATED CLERKSHIP (DH-LIC): AN OPPORTUNITY FOR CROSS-DISCIPLINE INTEGRATED LEARNING AND CURRICULAR FOCUS ON THE UNDERSERVED Mim Ari[3]; Julie Venci[1, 2]; Vishnu Kulasekaran[1, 2]; Jennifer Adams[1, 2]. [1]Denver Health, Denver, CO; [2]University of Colorado, Aurora, CO; [3]Cook County Health and Hospital System, Chicago, IL. (Control ID #2703167)

NEEDS AND OBJECTIVES: TBL is a flipped classroom approach, which moves beyond acquiring facts towards application and synthesis of information. A TBL curriculum is well established at the University of Colorado SOM in the Internal Medicine (IM) clerkship. To more closely mirror our LIC students' clinical training experience—simultaneously meeting clinical core competencies across specialties in an underserved setting—we redesigned and built upon the IM clerkship curriculum to make the topic-based TBL sessions multidisciplinary, longitudinal, and include topics related to caring for a vulnerable patient population.

SETTING AND PARTICIPANTS: The DH-LIC is a yearlong clerkship for eight University of Colorado SOM third-year medical students based at an urban safety-net hospital. Students achieve competency in core disciplines simultaneously, while participating in an integrated didactic curriculum that includes a robust TBL component.

DESCRIPTION: Each topic-based TBL session has a standard structure of pre-work, a team readiness assurance test, and 2–3 application exercises (cases) facilitated by an experienced faculty member. Each team works together to generate differential diagnoses, provide diagnostic work-up, and offer treatment plans. Six sessions from the original IM clerkship were redesigned to meet broader LIC curricular goals: reactive airways, chest pain, altered mental status, anemia, pulmonary infections, and renal disease. Two sessions were developed de novo for the LIC: abdominal pain, and menopause/bone health. Each session had content added to include patients of different ages (adult, pediatric, geriatric, adolescent), take place in different settings (inpatient, outpatient, ED), include different disciplines (IM, pediatrics, OB/GYN, psychiatry, surgery, emergency medicine), and highlight themes related to taking care of vulnerable populations (substance use disorders, access to care).

EVALUATION: Students are asked to evaluate the TBL sessions during periodic focus groups and through standard written course evaluations.

DISCUSSION/REFLECTION/LESSONS LEARNED: TBL has been well received and students demonstrate advanced clinical reasoning during sessions. Multi-disciplinary TBL cases with a focus on underserved care reinforce what is modeled in the DH-LIC curricular activities. General internists, on the front lines of patient care, often encounter undifferentiated presentations. Our redesigned curriculum encourages students to avoid diagnostic anchoring and think broadly. Curricular space to emphasize themes related to underserved care is also important to equip students with strategies to best serve vulnerable patients. Feeling empowered to assist and advocate for patients is likely to support students in the development of the resilience required for a career in primary care serving the underserved. Elements of this curriculum would be easily exportable to other medical education programs with similar curricular goals.

THE AMBULATORY EDUCATION BOARD: AN INNOVATIVE TOOL FOR AMBULATORY CURRICULUM AND FACULTY DEVELOPMENT Rebekah Weil[1]; Elizabeth M. Haney[3]; Katherine A. Iossi[2]. [1]OHSU, Portland, OR; [2]OHSU/PVAMC, Portland, OR; [3]Oregon Health & Science University, Portland, OR. (Control ID #2702052)

NEEDS AND OBJECTIVES: In 2011, Oregon Health and Science University (OHSU) transitioned to a 3 + 1 curriculum and created two half- day ambulatory teaching seminars in place of pre-clinic conferences. With this transition, we saw an opportunity to improve our ambulatory teaching by incorporating more active learning strategies and emphasizing consistent, high-quality, engaging ambulatory didactic sessions. To accomplish this, we redesigned our Ambulatory Editorial Board (AEB) in a way that enables peer review, facilitates faculty development around active learning strategies, and elicit resident input.

SETTING AND PARTICIPANTS: OHSU is a mid-sized, university based program with approximately 30 residents per year. Half-day seminars include: Primary Care Ambulatory Topics (PCAT), Evidence-based Medicine (EBM), Practice-based Learning and Improvement (PBLI) as well as EHR inbasket management time and an "ambulatory report" case conference., Prior to the implementation of the 3 + 1, 2–4 faculty members reviewed each educational packet without input from teaching faculty or residents.

DESCRIPTION: The AEB meets weekly or biweekly and includes residents, standing faculty members and those faculty teaching in the block. In addition to coordinating the calendar and general topic selection, the redesigned AEB also coordinates PCAT topics with PBL and EBM to create block themes. At each

meeting, faculty and residents review proposed content and teaching materials together. Two meetings are allocated for each topic block: the first is meant to review evaluations from prior years and discuss which topics should be covered and what interactive teaching methods could be used. The second meeting allows the faculty and residents in charge of that block to present their materials for review and critique.

EVALUATION: Overall, the feedback from residents and faculty has been positive with regard to their participation in the AEB meetings. Faculty are eager and willing to accept feedback from residents about how and what should be taught. We achieved our goals of having interactive, varied educational activities during the +1 week. Additionally, all of our sessions now include some form of active learning.

DISCUSSION/REFLECTION/LESSONS LEARNED: The AEB at OHSU provides opportunities for faculty to develop skills as educators and encourages them to employ active learning techniques into didactic sessions. Having two separate meetings on each topic block encourages timely development of materials, allowing for peer review prior to session delivery, which optimizes content and teachings strategies.. The AEB format gives residents an opportunity to engage in curriculum design and contribute opinions about what and how they learn regarding ambulatory topics; we have found this contribution invaluable for faculty. Next steps include increasing resident involvement in ambulatory didactic teaching, sustaining faculty commitment, engaging and properly representing all clinical sites, maintaining meeting times against competing demands, and better using automated learning management systems.

THE AMBULATORY PROCEDURES WORKSHOP: A FORMAL, SIMULATED TRAINING SESSION FOR INTERNAL MEDICINE INTERNS Jared W. Klein; Toby I. Sinton; John H. Choe. University of Washington, Seattle, WA. (Control ID #2691842)

NEEDS AND OBJECTIVES: Many internal medicine residents receive formal training on procedures such as central line placement, thoracentesis and paracentesis, but few residency programs provide teaching on procedures more commonly performed in ambulatory settings. As a result, trainees have disparate experiences with minor procedures based on their exposure during medical school, specific residency rotations and the skills of supervising attendings. Our goal is to provide interns with standardized training in performing arthrocentesis, skin biopsy and abscess incision and drainage. We aim to achieve a minimal level of familiarity with these procedures, increase interns' confidence and ultimately improve their satisfaction in practice.

SETTING AND PARTICIPANTS: The University of Washington (UW) internal medicine residency is a large academic program with over 150 residents. During the first 3 months of residency all categorical and primary care internal medicine interns participated in one of three half-day ambulatory procedure workshops at the UW simulation training center.

DESCRIPTION: Interns were encouraged, but not required, to review online resources prior to the workshop. The workshop opened with a review of the principles of informed consent before dividing interns into small groups (3–5 trainees) and rotating through three separate simulation stations to practice knee and shoulder (subacromial) injections, punch biopsies of the skin, and abscess incision and drainage. Simulation models were used: joint injections were performed both on polyethylene models and cadaveric specimens; skin biopsies were accomplished on pigs' feet; and abscess drainage was carried out on models crafted for the workshop. Experienced attending physicians staffed each simulation station, reviewing the key steps in each procedure, and providing real-time feedback.

EVALUATION: During the summer of 2016, fifty-three interns participated in the inaugural series of ambulatory procedure workshops with all interns completing a baseline survey. Before the workshop, interns reported the least confidence in performing subacromial shoulder injection; 94% were "completely" or "somewhat" uncomfortable performing this procedure. The majority of interns were also uncomfortable performing knee injections (72%) and skin biopsies (53%). Very few interns had received prior formal training in any of the procedures (from 7.5% for shoulder injection to 21% for abscess incision & drainage). We will survey interns at the end of the academic year to assess confidence in performing these procedures as well as quantifying the number they have performed, comparing results from this cohort to a prior class of interns who did not receive training.

DISCUSSION/REFLECTION/LESSONS LEARNED: Few internal medicine interns have had formal training in performing common ambulatory procedures and most lack confidence in carrying out these skills. We expect this training will boost confidence in performing selected procedures and increase how many are performed during the first year of residency training.

THE BEDSIDE SWAP: ASSESSING MEDICAL STUDENTS RESPONSE TO PERSPECTIVE-TAKING FOR "DIFFICULT PATIENTS" ON THE WARDS Brianna Rossiter[1]; Melissa McNeil[2]; Gaetan Sgro[3]. [1]UPMC, Pittsburgh, PA; [2]University of Pittsburgh Medical Center, Pittsburgh, PA; [3]VA Pittsburgh Healthcare System, Pittsburgh, PA. (Control ID #2707312)

NEEDS AND OBJECTIVES: There are an increasing number of studies showing the benefits of narrative writing within medical education. Perspective-taking is a cognitive skill defined as "an understanding of other people's mental states" and has been studied as a way to teach empathy. This approach can be most helpful during encounters with so-called "difficult patients" by allowing the trainee to see the world through the patient's eyes. This exercise assessed medical students' response to perspective-taking as a substitute for a traditionally written history and physical exam on an identified "difficult patient".

SETTING AND PARTICIPANTS: Exercises were completed by a group of medical students in their University of Pittsburgh School of Medicine (UPSOM) Internal Medicine Clerkship course. The exercise was reviewed by the Internal Medicine Clerkship Director and the Curriculum Committee of the Medical School. IRB approval was obtained. "Difficult patients" were student-identified after a broad definition was provided during the introductory session.

DESCRIPTION: The following prompt was provided to the students: "Imagine that you are that patient, meeting and interacting with you (the medical student). Please write a first-person account from the patient's perspective of their medical experience." This narrative was substituted for a traditionally written history and physical exam (H&P) and was mandatory. After completing the exercise, students participated in a workshop lead by one of the authors where essays were read and discussed. Each student then completed a Likert survey assessing their response to the exercise. All written material was

collected and reviewed. Students were required to participate in the survey but were given the option to "opt out" of having their data included in analysis.

EVALUATION: Twenty-three students participated in the exercise. Selected quotes from the perspective-taking exercise included: "I only see my doctors a few times a day for a few min, otherwise I'm just waiting for the next thing they're going to do to me. I feel like nobody cares about how I am feeling" and "I look down, I'm in a hospital gone, with the back open, naked…there is no dignity or privacy in this place". The average response on a 1–5 likert scale (1 = strongly disagree, 5 = strongly agree) for the statement, "I found this exercise helpful to better understand the challenges my patient faces" was 4.26 ± 0.75. The average response was 4.26 ± 0.81 for the statement, "I feel more empathetic toward my patients after this exercise". An open-ended, survey comment included: "We don't get to put ourselves in our patients' shoes very often and we should do it more often".

DISCUSSION/REFLECTION/LESSONS LEARNED: Overall, medical students had positive responses to the narrative exercise. Majority of medical student identified the exercise as a way to evoke empathy and self-reflect on interactions with "difficult patients". Perspective-taking in medical school education may play a positive role in professional development, patient care, and physician well being.

THE DEVELOPMENT, IMPLEMENTATION AND ASSESSMENT OF AN INTERNAL MEDICINE HOUSESTAFF RESEARCH PROGRAM Alev Atalay[1]; Kevin Ard[2]; Emily D. Bethea[2]; Maria Yialamas[3]. [1]Brigham and Women's Hospital, Jamaica Plain, MA; [2]Massachusetts General Hospital, Boston, MA; [3]Brigham and Women's Hospital, Somerville, MA. (Control ID #2688386)

NEEDS AND OBJECTIVES: A survey revealed that a majority (88%, $n =$ 67) of our residents were interested in additional research exposure during residency training. A focus group of program directors, teaching faculty, and chief residents discussed possible ways to increase resident exposure to research.

SETTING AND PARTICIPANTS: The Housestaff Research Project (HRP) was designed and implemented as part of the internal medicine residency program at Brigham and Women's Hospital (BWH). All of our residents had the opportunity to participate.

DESCRIPTION: BWH medicine residents were engaged in a new research initiative, the HRP, in which the entire housestaff participated in a yearly research project. Residents submitted clinical research questions by RFA or small group brainstorming sessions. One representative from each group presented the proposal to the entire housestaff, and final projects were selected by resident voting. Funding was provided by the Internal Medicine Residency and the Department of Medicine. In addition, a curriculum which reviewed core research topics was integrated into the conference schedule.

EVALUATION: Two projects have been chosen to date. Evaluation has included housestaff surveys and interviews with the resident project leaders. Ninety-five percent of residents were familiar with the HRP, mostly through noon conference updates on current projects and/or a research-focused noon conference series. Ten percent of residents were directly involved with data collection and the day to day running of the HRPs. The resident project leaders felt that a strength and unique aspect of the HRP, as compared to other research projects, was the collaboration with co-residents. Both projects have been presented as posters at local or national conferences and manuscripts are in preparation.

DISCUSSION/REFLECTION/LESSONS LEARNED: The HRP has broadened the exposure of research concepts to all BWH medicine residents. The resident leaders and those directly involved in the HRP projects experienced the most significant benefits from their involvement, including learning new research skills, developing databases for use in future resident projects, and increased camaraderie with co-residents. Residents are mixed as to whether they prefer to find and lead their own project or join group projects. Our main challenge is maximizing the number of participants while maintaining the integrity of the project and the value of the project for each individual resident.

THE DISCHARGE PROCESS AND UNEXPECTED <30-DAY READMISSIONS: LESSONS LEARNED FROM AN INTERDISCIPLINARY NOVEL CURRICULUM PILOT Lindsey Merrihew[2]; Jennifer S. Myers[3]; Mark T. Upton[1]; Rachel K. Miller[2]. [1]University of Pennsylvania, Philadelphi, PA; [2]University of Pennsylvania, Philadelphia, PA; [3]Perelman School of Medicine, University of Pennsylvania, Philadelphia, PA. (Control ID #2705729)

NEEDS AND OBJECTIVES: With 30 day hospital readmissions a quality and value-based metric, hospitals recognize that safe discharge requires an interprofessional team approach. Additionally, health professions education includes competencies in both transitions of care and interprofessional communication and team work. Objectives:1. To critically evaluate factors leading to unexpected readmissions 2.To recognize roles and responsiblities of interprofessional team members in the discharge process 3.To reflect and strategize on ways that individually, team, or system-wide, we can improve transitions of care

SETTING AND PARTICIPANTS: We created a 2.5 hr session for PGY2 internal medicine residents, pharmacy residents, early-career nurses, nurse practitioner students, and social work masters students. We had 63 participants in 4 sessions from March through May 2016.

DESCRIPTION: −15 min introductory didactic −1 h interprofessional team review of a readmission case utilizing an on-line tool −1 h interprofessional faculty-mentored small group feedback and reflection

EVALUATION: 53 participants filled out the post curriculum evaluation. 50 identified their speciality: 28 PGY2s medicine residents, 4 pharmacy residents, 10 early career nurses, 2 NP students, 6 social work masters students. 82% agreed or strongly agree that the readmission review was useful to their education. 96% agreed or strongly agreed that the group discussion was beneficial. 96% recommended continuing this activity. Participants generally rated their competency in transitions of care as high before the session (4.67 on a 6 point scale), and scores increased after the session (5.06). In response to what participants learned, the most common themes were appreciation and understanding of other discipline's roles; need for patient-centered discharge instructions with good anticipatory guidance and clear language; importance of interdisciplinary communication and cooperation; appreciating the complexity of the discharge process and understanding where gaps are; and, improved understanding and communication with post discharge services and providers.

DISCUSSION/REFLECTION/LESSONS LEARNED: Participants rated their competence in transitions of care higher after this session. Almost all found it useful to their education and felt it should be continued for future participants. They recognized the complexity of discharge and need for improved communication. The biggest lesson learned was greater appreciation and understanding of interprofessional roles in the discharge process.

THE EFFECT OF A SOCIAL JUSTICE INTEREST GROUP ON RESIDENT EXPERIENCE AND CAREER PLANNING Janine Knudsen[4]; Maria D. Garcia-Jimenez[3]; Angela Arbach[2]; Matthew Durstenfeld[3]; Ofole Mgbako[3]; Monica Maalouf[1]. [1]New York University, New York City, NY; [2]New York University, New York, NY; [3]New York University School of Medicine, New York, NY; [4]New york university, New York, NY. (Control ID #2705817)

NEEDS AND OBJECTIVES: Resident physicians, especially those practicing in safety net health systems, must understand social determinants of health to adequately care for vulnerable patients. Few residency programs have a rigorous curriculum for health disparities or opportunities for physician advocacy. To fulfill this need at Bellevue Hospital, NYU residents created the Social Justice Interest Group (SJIG). Over two years, SJIG has developed a community of physician advocates, a forum for education and discussion, and a platform for action to improve patient care.

SETTING AND PARTICIPANTS: SJIG membership includes NYU housestaff across training levels and specialties including Internal Medicine, Emergency Medicine, Psychiatry, and Pediatrics. The interdisciplinary group hosts events aimed at enhancing resident awareness of health disparities and social determinants of health and targets the community of residents, medical students, and faculty. Programming focuses on injustices faced by patients at Bellevue Hospital, the largest safety net hospital in New York, serving the city's underserved populations as well as incarcerated patients through a Department of Corrections ward.

DESCRIPTION: SJIG programming is guided by resident interest and includes a speaker series, community forums, workshops, site visits, and quality improvement projects. Our monthly Physician Advocacy Speaker Series has covered topics such as incarceration, immigration, transgender health, and safety net healthcare systems. Our interdisciplinary Community Forums for residents have served to facilitate dialogue about national events including how the recent election may affect our patient population. Workshops and electives have addressed implicit bias and prison health, and site visits include Rikers Prison and the Bellevue Men's Homeless Shelter. Ongoing projects include an emergency medicine/internal medicine collaboration to create an intake for incarcerated patients that assesses their unique healthcare needs.

EVALUATION: We are evaluating SJIG's impact on resident experience, burnout, and career planning through a survey with both quantitative and qualitative elements. Our survey participants include residents involved in SJIG, residents exposed to SJIG programming, and program faculty. Survey results will be statistically analyzed and qualitative data will be coded to draw out key themes and major areas of impact.

DISCUSSION/REFLECTION/LESSONS LEARNED: SJIG is a novel resident-driven model for delivering a social justice curriculum to residents. The group has fostered discussions of health disparities, built advocacy skills, and deepened knowledge of the needs of safety net populations. Our survey-based assessment aims to support our hypothesis that building a rich advocacy curriculum can improve resident skills, reduce burnout of residents working in safety net systems, and ultimately improve patient care. We will use our evaluation to reflect on SJIG's impact, refine future efforts, and identify elements most translatable to other residency programs

THE IMPACT OF A BOOK CLUB ON CONFIDENCE, SELF-RELIANCE, AND COMMUNITY IN THE DUKE DEPARTMENT OF INTERNAL MEDICINE Laura M. Caputo. Durham VA/Duke University Hospital, Durham, NC. (Control ID #2699260)

NEEDS AND OBJECTIVES: Burnout plays an important role in the lives of medical learners and practitioners. It can decrease work-life satisfaction and quality of care, and increase misconduct. Book clubs have the potential to improve burnout; physician groups have documented participation in book clubs, but impacts have not been directly measured. This project sought to create a book club within the Duke Department of Internal Medicine (DoM), and to determine whether it would impact burnout in participants. It was hypothesized that endpoints would be stabilized or improved in participants compared to those who did not attend.

SETTING AND PARTICIPANTS: Book club events were held on campus every 2–3 months for 1 year. Free books were offered to promote participation. Events consisted of ~90 min of open discussion about selected titles. All members of the DoM and medical students were invited; ~120 DoM faculty and trainees participated in at least 1 event during the year. DoM providers who did not attend events were also surveyed; 91 volunteers comprised the comparison group.

DESCRIPTION: In this quasi-experimental trial, self-reports of burnout and resilience were assessed over time, and results were compared between the two groups. Data were collected anonymously via a 6-question survey designed for this study that addressed perceptions of community support; knowledge of academic resources; work-life satisfaction; self-care; competitiveness; and impact of work on self-confidence. Responses were scored on a 1–10 scale; lower scores implied higher risk for burnout. Surveys were distributed at the start of the study period and after each event. Demographics were collected with each survey.

EVALUATION: Participation in the study was voluntary; subjects were not randomized, but statisticians were blinded. Groups were compared for each question separately using a two-sided, two-group t-test. For all 6 questions, the club participants scored significantly higher on the Likert scale, and responses were reproduced over the study period. The groups differed significantly in some demographics.

DISCUSSION/REFLECTION/LESSONS LEARNED: The results of this study imply that the book club had a positive impact. However, club participants' baseline scores started higher (though not significantly); so self-selection likely caused groups to differ. Additionally, demographic differences limit comparison between groups. Age, years of experience, and number of children were significantly higher in the book club group. Better scores could be attributable to other factors, eg better schedules, clinical confidence, or family support.

THE IMPACT OF A FACE-TO-FACE INTERNAL MEDICINE RESIDENT EDUCATIONAL CURRICULUM ON ELECTRONIC MEDICAL RECORD PATIENT PORTAL USAGE Halle G. Sobel; Sara Roberts. University of Vermont Medical Center, Burlington, VT. (Control ID #2707369)

NEEDS AND OBJECTIVES: Using a medical record-based patient portal can empower patients, increase quick, effective doctor-patient communication, and

help practices achieve National Council for Quality Assurance (NCQA) recognition as Patient Centered Medical Homes. underused, according to studies. The literature shows that a lack of knowledge about the resource, lack of use by physicians, satisfaction with phone-based communication, poor computer literacy, and older age are common reasons for this underuse. Our goal was to evaluate baseline patterns of patient portal use in a resident internal medicine clinic at an academic medical center, provide a brief, in-person educational session to the residents on patient portal usage, and evaluate the effect on resident portal use.

SETTING AND PARTICIPANTS: Participants were 42 internal medicine residents in a continuity clinic affiliated with the University of Vermont Medical Center. The EMR utilized was Epic. The study period spanned two academic years: 2015–2016 and 2016–2017. A subpopulation of 24 residents who overlapped in both academic years was included.

DESCRIPTION: The study split data collection into pre- and post- education implementation periods. Data was mined from the EMR for the pre-implementation period (7/1/15 -6/30/16) to quantify ingoing and outgoing messages by the resident. Brief in-person education was then performed during a required ambulatory conference for five groups of residents (7-8/2016). Teaching was delivered by the Principal Investigator and included demonstrations on initiating MyHealth messages, sharing results, and responding to patient questions. Data was collected in a similar fashion for the post-implementation period (9/1/16-12/1/16, preliminary, and 9/1/16-3/1/17, projected). Three paired t-tests were performed to compare incoming, outgoing, and combined monthly emails per resident. A biostatistician assisted in analysis.

EVALUATION: A total of 151 messages were sent and 255 were received by residents in the year-long pre-intervention period compared to 78 messages sent and 163 mesages received in the preliminary 3-month period post intervention. Five residents had no post data and were excluded from analysis. Each resident averaged 0.74 messages out per month pre-intervention and 1.79 post-intervention, 1.35 outgoing pre and 3.12 post, and total in and out 2.09 pre and 4.71 post. The latter two comparisons were statistically significant

DISCUSSION/REFLECTION/LESSONS LEARNED: Our study demonstrates that a brief in-person educational session for residents increased patient portal use quantifiably in *both* sent and received messages by a factor of two and in a statistically significant way. One barrier to portal use by patients, per surveys, was lack of physician use. This study provides evidence for that survey-based claim and also offers a solution to overcome it.

THE INSULIN TITRATION PROGRAM: A LONGITUDINAL CHRONIC CARE INTERVENTION BENEFITS MEDICAL STUDENTS AND PATIENTS Lani Kroese; Ryan Johnson; Kelsey Savery; Mohan Nadkarni; Ira Helenius. University of Virginia, Charlottesville, VA. (Control ID #2704254)

NEEDS AND OBJECTIVES: The purpose of this study is to evaluate the impact of volunteering for the Insulin Titration Program (ITP), a longitudinal patient care experience, on medical students' overall learning and their attitudes, knowledge, and behaviors related to patients with diabetes.

SETTING AND PARTICIPANTS: The study was conducted at University Medical Associates, an ambulatory internal medicine teaching clinic in the University of Virginia (UVa) Health System. Participants in the study included medical students from UVa School of Medicine who volunteered with the ITP program for at least 3 months. Fifty-one students participated in the program.

DESCRIPTION:Medical students from all classes were recruited by student leaders and voluntarily participated in the program. They underwent 4.5 h of training which included motivational interviewing training, nutrition lectures, and peer mentoring during phone calls. Training also included learning how to properly document in patient charts and a review of the program's protocols. Students were then paired with patients with uncontrolled diabetes who had been referred to the program by their primary care physicians. The student volunteers made weekly phone calls to their patients. During these calls, student and patients discussed trends in blood glucose readings, any hyperglycemic or hypoglycemic episodes, diet, and exercise. The students also adjusted their patient's long acting insulin dose if indicated based on the ITP protocol. Oversight and assistance was provided by attending physicians, pharmacists and diabetes educators at the clinic.

EVALUATION: Upon completion of a student volunteer's involvement, we administered a web-based survey. The survey consisted of five open-ended, reflection-based questions and demographic questions. Seventeen student volunteers completed the online survey (response rate 33%). The final sample included one M1, nine M2, one M3, and six M4 students. Results from the clinical outcome evaluation of the ITP showed that patients who were paired with med students had a statistically significant improvement in their HgbA1c compared to patients not enrolled in the study (−1.4% vs −0.4%).

DISCUSSION/REFLECTION/LESSONS LEARNED: A number of themes emerged from our qualitative survey data. Students noted that they were able to apply preclinical concepts regarding diabetes therapy in the context of their patient's unique struggles. For many, this gave a new found appreciation for barriers to clinical compliance, and more effective ways to address these barriers. Additionally, the structure of the program as a longitudinal intervention allowed volunteers practice with motivational interviewing techniques. The most commonly reported meaningful part of the volunteer experience was the opportunity to develop a personal relationship with their patient and receive positive affirmation either from the patient directly or from the patient's clinical results.

THE INTERPROFESSIONAL STUDENT HOTSPOTTING LEARNING COLLABORATIVE: A THREE-YEAR MULTICENTER EXPERIENCE John Marshall[1, 6]; David Goldstein[2, 6]; Cyrus Mazidi[3, 6]; Jacob Quinton[4, 6]; Rita Kuwahara[1, 6]; Eliza Hutchinson[5, 6]. [1]Emory University, Atlanta, GA; [2]University of California, San Diego, San Diego, CA; [3]Tulane University, New Orleans, LA; [4]Yale University, New Haven, CT; [5]Swedish Medical Center, Seattle, WA; [6]Camden Coalition of Healthcare Providers (CCHP), Camden, NJ. (Control ID #2707109)

NEEDS AND OBJECTIVES: There is currently an urgent need to address the population of high needs high cost (HNHC) patients in America. We feel that part of the solution begins at the student level, by helping teach the background, attitudes, and skills which care teams must adopt to address this unique patient population. Our objectives were to design an immersive interprofessional educational experience with robust curriculum delivered by experts in the care of HNHC patients which can be implemented at health professions schools nationally.

SETTING AND PARTICIPANTS: Now in the program's third year, a total of thirty-four of our major medical institutions have participated in annual student hotspotting cohorts. Participants have included students from nursing, public health, medicine, social work, physical therapy, occupational therapy, business, divinity, and law.

DESCRIPTION: Teams self-assemble and apply for acceptance through a selection process staffed by representatives from the Camden Coalition of Healthcare Providers (CCHP), Primary Care Progress (PCP), and the Association of American Medical Colleges (AAMC). Teams attend a kick-off conference in Camden, NJ with an introduction to HNHC patient work as well as an emphasis on teaming. Over the next six months, teams engage in a formal, open-source curriculum found on a central website consisting of monthly skills labs, monthly local preceptor-led case conferences, and monthly expert-led teleconferences with MacArthur Genius Dr. Jeffrey Brenner of CCHP. This guides teams as they conduct an immersive HNHC patient intervention, starting with patient recruitment, proceeding to home visits and appointment accompaniment, and concluding with patient graduation. Educational topics include trauma-informed care, relationship modeling, motivational interviewing, navigation of complex institutions, and barrier recognition and troubleshooting.

EVALUATION: The ripple effects of such a movement are complex and in need of study. With the current cohort we are conducting semi-structured interviews with students before and after the intervention to analyze the program's effects on learners.

DISCUSSION/REFLECTION/LESSONS LEARNED: The true value of this program is empowering students to be in the field with HNHC patients. The experience can be challenging as students first address barriers to interprofessional education at their local institutions, and then as they step directly into the daily challenges faced by our most medically- and socially-complex patients. Students come to rely on each other and look to guidance from CCHP as they experience true high-touch, trauma-informed, interprofessional care. It is our hope that these young health professionals will move on from this program to continually change culture around them and reshape local health systems to allow HNHC patient care to be carried out more effectively across the nation.

THE USE OF HOLOLENS TO ENHANCE THE MEDICAL SCHOOL LEARNING EXPERIENCE

Janet Adegboye[2]; Neil Mehta[2]; Dileep Nair[1]. [1]Cleveland Clinic Lerner College of Medicine, Cleveland, OH; [2]Cleveland Clinic Lerner College of Medicine, Columbus, OH. (Control ID #2707457)

NEEDS AND OBJECTIVES: Medical education is an evolving field, especially with the rapidly advancing technology of our society. This project explored the use of augmented reality with Microsoft HoloLens to enhance how anatomy is taught in medical school. We assessed three aspects of the student experience: the amount of knowledge gained, the cognitive load required to learn, and the overall satisfaction with HoloLens.

SETTING AND PARTICIPANTS: The study population consisted of 31 second-year medical students at the Cleveland Clinic Lerner College of Medicine (CCLCM). This was a two-week study that took place during the neurology block. The curriculum at CCLCM includes problem-based learning (PBL) sessions, seminars, and self-study. The PBL sessions consist of eight medical students and a faculty facilitator discussing weekly clinical cases.

DESCRIPTION: We incorporated HoloLens models to teach neuroanatomy in 2 out of the 4 of the PBL groups. The students in those groups were able to use the HoloLens for self-study during the week. The other 2 PBL groups learned the same material, but in the traditional learning format. The groups were reversed after the first week in order to give every student an opportunity to learn with HoloLens. At the end of each week, the students took a quiz to assess their knowledge and a survey to assess their cognitive load and learner satisfaction.

EVALUATION: Both groups had a similar performance on the neuroanatomy knowledge quiz; however, 30% of the students in the HoloLens group felt that it was easy to learn the concepts compared to 11% in the control group. Of the students in the HoloLens group, 80% believed that the addition of HoloLens would enhance how neuroanatomy was currently taught, assuming that the appropriate HoloLens content was available. Furthermore, 67% agreed that they would want to use HoloLens to learn other medical content. Overall, the quiz and survey responses suggested that the students in the HoloLens group had a decreased cognitive load and that most students felt positive about their HoloLens experience.

DISCUSSION/REFLECTION/LESSONS LEARNED: I anticipate that this project is among the first of many that will explore the possibilities of holography in medical education. Although we could see certain trends in the data, we were not able to show significance because I was limited with a small sample size. In the future, I would want to do this project on a larger scale and include more organ systems in addition to neurology. This will provide a deeper understanding of how HoloLens technology could be used to enhance medical education.

THINK LIKE A DOCTOR: AN INNOVATIVE CLINICAL REASONING CURRICULUM FOR CLERKSHIP-LEVEL MEDICAL STUDENTS

Eliana Bonifacino[1]; Deborah DiNardo[3]; Melissa McNeil[2]. [1]UPMC, Pittsburgh, PA; [2]University of Pittsburgh Medical Center, Pittsburgh, PA; [3]University of Pittsburgh School of Medicine, Pittsburgh, PA. (Control ID #2707367)

NEEDS AND OBJECTIVES: In a recent report titled "Improving Diagnosis in Health Care," the Institute of Medicine highlighted the urgent need for better training in decision-making across all medical disciplines. Despite the wide recognition of this need, there is no consensus regarding the best methods to educate third-year medical students about diagnostic reasoning. We introduced a clinical reasoning curriculum with goals of: 1. Familiarizing medical students with the cognitive psychology of decision-making and its implications in medical care 2. Providing a structure for applying clinical reasoning principles to diagnostic reasoning 3. Practicing concepts through the use of skill-specific drills focusing on discreet portions of the decision making process

SETTING AND PARTICIPANTS: All third year medical students at the University of Pittsburgh School of Medicine in their Internal Medicine rotation between January-July 2017 will be eligible to participate. The curriculum was vetted by the Internal Medicine Clerkship Director and approved by the Curriculum Committee of the medical school. IRB approval for evaluation of the curriculum was obtained.

DESCRIPTION: This curriculum includes two components: i) Interactive online modules and ii) A case-based workshop. The online modules utilized in this curriculum were developed by clinician educator faculty with support from a grant to Dr. William Follansbee from the Hearst Foundations. The content in these modules include: cognitive psychology of decision making, introduction of heuristics, summary statements, and cognitive biases. These online modules include expert video about key concepts, contain cases, and are interactive with prompts for learners to answer questions. The workshop creates an opportunity for students to operationalize this knowledge through skill-specific group-based drills in the identification of key clinical findings, use of semantic qualifiers, creation of summary statements, and generation of a differential diagnosis.

EVALUATION: The curriculum will be evaluated through the use of a quiz on core concepts and vocabulary in clinical reasoning, as well as through evaluation of the demonstration of clinical reasoning in each student's History and Physical note documentation during their rotation using a rubric.

DISCUSSION/REFLECTION/LESSONS LEARNED: Explicit clinical reasoning education is gaining increasing awareness as a need for physicians-in-training. This curriculum offers clerkship-level medical students an introduction to the cognitive psychology behind medical decision making and provides an innovative skill-specific approach to reasoning that boils down the complex process of making a diagnosis to individual skills needed to make a diagnostic decision. Introduction of these skills at the beginning of their internal medicine clerkship primes the student with an approach for clinical reasoning in the subsequent weeks of their clerkship. Previous studies have suggested that introduction of clinical reasoning education could even occur at earlier points in undergraduate medical training.

TRAINING FOR ENGAGEMENT AND ADVOCACY FOR COMMUNITY HEALTH: A NOVEL WAY TO TEACH RESIDENTS SKILLS TO ADDRESS KEY ISSUES IN COMMUNITY HEALTH Erica N. Johnson[2]; Stephanie Nothelle[1]; Manasa Ayyala[3]. [1]Johns Hopkins Bayview Medical Center, Baltimore, MD; [2]Johns Hopkins School of Medicine, Baltimore, MD; [3]Johns Hopkins University School of Medicine, Baltimore, MD. (Control ID #2701578)

NEEDS AND OBJECTIVES: Residents often care for patients whose outcomes are heavily influenced by social determinants of health (SDH), yet have little formal education about these determinants. The curricular objectives are: 1) To teach residents to identify and document social factors influencing health and access information about resources 2) To provide an opportunity for team and community based learning in the neighborhoods surrounding our academic medical center.

SETTING AND PARTICIPANTS: Training for Engagement and Advocacy for Community Health is a longitudinal residency curriculum that provides teaching about SDH in a variety of clinical experiences for residents in the Johns Hopkins Bayview Internal Medicine Residency Program.

DESCRIPTION: Despite progress in the management of chronic conditions and health resource availability, significant disparities in disease burden and health outcomes persist. Social factors contribute to many of these health inequalities. Residency programs are well positioned to address health inequalities because residents often care for community members at highest risk for poor health outcomes. Further, the ACGME requires that residency programs address health disparities through quality improvement. Training for Engagement and Advocacy for Community Health is a longitudinal curriculum dedicated to the integration of teaching about SDH in a variety of clinical experiences throughout residency. Starting with internship, residents participate in flipped classroom didactic experiences about SDH and homelessness, community tours and discussions with community groups, and complete an interaction with a standardized patient to improve skills around the discussion of SDH. Throughout the rest of residency, the curriculum focuses on incorporating community health into the resident ambulatory experience. Residents work in teams assigned to neighborhoods served by our medical center and learn about specific SDH in their assigned area. They also work together on solutions to specific health problems unique to their continuity clinic patient population.

EVALUATION: Residents complete objective-based evaluations prior to these experiences and after that measure their knowledge of SDH, skills in assessment of SDH and attitudes towards community-oriented practice. These responses will be compared to residents from prior year groups who have not participated in this curriculum.

DISCUSSION/REFLECTION/LESSONS LEARNED: Despite varying levels of prior training in SDH, there remains a gap among residents in the knowledge and skill to address negative determinants and connect patients with resources in the community to help overcome these. We believe that by providing residents with meaningful community-based interactions, we allow them to develop the skills needed to successfully engage with the community, reducing the impact of negative social determinants of health on health outcomes. Accomplishing this through team-based learning in the resident continuity clinic also allows for the development of skills in collaboration and quality improvement.

TRAINING GAP IN AMBULATORY MEDICINE FOR RESIDENTS: AN APPROACH FROM A PATIENT'S PERSPECTIVE. Peter S. Park[2]; Deepa R. Nandiwada[1]; Jaishree Hariharan[3]. [1]University of Pennsylvania, Philadelphia, PA; [2]University of Pittsburgh Medical Center, Pittsburgh, PA; [3]University of Pittsburgh Medical center, Pittsburgh, PA. (Control ID #2702954)

NEEDS AND OBJECTIVES: Increasingly, residents practice in patient centered medical homes (PCMH) where care is delivered in collaborative and interdisciplinary framework. Knowing their inter-professional teams and understanding the patients' barriers to proper followup are paramount to delivering effective patient care. However, having had relatively little exposure to outpatient system during medical school, new interns find it overwhelming to navigate through the complexities of their PCMH. There is surprising dearth of literature studying experiential curricular models within the context of PCMH. We developed an innovative curriculum involving patient roleplays that is designed to: rapidly orient interns to multiple professions and system norms of their outpatient practice; and augment interns' understanding of patients' challenges in PCMH environment.

SETTING AND PARTICIPANTS: This pilot curriculum included 19 categorical interns of the Internal Medicine program at University of Pittsburgh Medical Center.

DESCRIPTION: Interns were asked to play the role of patients checking out of the clinic, with a patient scenario and checkout paperwork. They made "follow-up appointments" with their interdisciplinary team members to complete a few "after-visit patient tasks". They experienced the challenges patients

may face in navigating the clinic system and reflected on how best to enlist the help of the interdisciplinary team. A debrief followed, where the interns shared their experience as patients, clarified staff roles, reviewed barriers, and committed to practice-changing behaviors.

EVALUATION: The effectiveness of the curriculum is currently being evaluated with pre/post surveys. The questions used a 5-point Likert scale (from "not at all confident" to "very confident") to assess the interns' knowledge about inter-professional team roles, utilization of clinic staff, and the ability to guide patients through the local PCMH. The worksheets the interns filled out are being collected and qualitatively analyzed to identify the types of barriers experienced.

DISCUSSION/REFLECTION/LESSONS LEARNED: Preliminary data from the pre-curriculum surveys showed that only 21% felt confident in their ability to incorporate interdisciplinary team; only 32% replied they routinely utilized their team; and 74% were unsure whether they understood the challenges that patients experience when navigating through their clinic. The post-curriculum surveys are still being collected and the data analysis are pending. A few common themes arose during the post-curriculum debrief - for example, most interns felt that the clinic felt "hectic" and "rushed" from a patient's perspective. Most also expressed being "surprised" by the many resources the interdisciplinary team could offer. At the end of the debrief, the interns brainstormed and committed to individual practice-changing behaviors that they will apply to their daily clinic routine, such as printing out a separate patient instruction sheet at the end of the clinic visit, explaining follow-up tasks in detail.

TRAINING INTERNAL MEDICINE RESIDENTS TO ACT ON SOCIAL DETERMINANTS OF HEALTH USING THE SOCIAL DETERMINANTS OF HEALTH FAST FACTS Etsemaye P. Agonafer[2]; Maggie K. Benson[1, 2]; Thuy Bui[1, 2]. [1]University of Pittsburgh, Pittsburgh, PA; [2]University of Pittsburgh Medical Center, Pittsburgh, PA. (Control ID #2698636)

NEEDS AND OBJECTIVES: *Social determinants of health (SDH) impact the health of individuals but have not traditionally been the focus of physicians, who are trained predominantly to intervene on downstream health effects created by a suboptimal biopsychosocial environment. We developed an introductory curriculum for internal medicine interns using a learning tool titled "Social Determinants of Health Fast Facts" to increase interns' awareness of SDH's impact on health and knowledge of SDH-based interventions.*

SETTING AND PARTICIPANTS: *The curriculum was implemented at the University of Pittsburgh Internal Medicine Residency Program during the 4-week intern ambulatory block. 44 interns participated in the first year.*

DESCRIPTION: *In the first week, interns attended a 1-hour small group session to introduce the framework of SDH, discuss clinical "triggers" that should prompt inquiry into the SDH and brainstorm ways to clinically intervene on the SDH. In weeks 2–4, interns were emailed a total of 12 SDH Fast Facts to review independently. The SDH Fast Facts are brief, clinical vignettes about key SDH topics commonly encountered by clinicians, followed by a multiple-choice question pertaining to SDH. The correct answer to the question is supported by 2–3 key evidence-based learning points. In the fourth week, interns attended a 30-min small group discussion to reflect on how they could apply lessons learned in the SDH Fast Facts to patients they care for in their continuity clinics.*

EVALUATION: *To evaluate the effectiveness of the brief curriculum in 1) changing interns' attitudes, knowledge, behavior about screening and 2) comfort intervening on identified SDH, a pre, post, and delayed post- survey was conducted. This was compared to a historical control of PGY-2 residents who did not receive the curriculum.*

DISCUSSION/REFLECTION/LESSONS LEARNED: *Both interns who received the curriculum and resident controls agreed that the SDH are important determinants of health that physicians should intervene on. Both interns and residents also reported feeling more comfortable addressing and intervening on diseases such as hypertension, diabetes, obesity and substance use than on SDH such as housing instability, low educational attainment or social isolation. Interns who received the curriculum reported feeling more confident in their ability to address social isolation after participation in the curriculum. Interns favored the way SDH Fast Facts taught an evidence-based approach to addressing SDH in clinical practice and recommended the curriculum be continued in future years. Lastly, the evaluation identified a need for further faculty development on prompting trainees to address SDH during preceptor encounters. Overall, this was found to be an effective training tool that scaffolds experiential learning by providing a framework for SDH that empowers trainees to take a proactive role in addressing SDH.*

ONLINE RESOURCE URL (OPTIONAL): SDH Fast Facts http://www.sgim.org/web-only

TRAINING INTERNAL MEDICINE RESIDENTS TO PROVIDE SUBDERMAL CONTRACEPTIVE IMPLANTS AND INTRAUTERINE DEVICES (IUDS) IN A PROCEDURES CLINIC: AN INNOVATIVE MODEL Meghan C. Geary; Christiana Zhang; Mindy Sobota. Brown University, Providence, RI. (Control ID #2706721)

NEEDS AND OBJECTIVES: The American College of Physicians considers contraception a "core competency" in women's health. The most highly effective methods of contraception include contraceptive implants and intrauterine devices (IUDs), which can be 20x more effective than contraceptive pills. Contraceptive implants and IUDs are now considered first line, but are used by only 7.2% of reproductive-age women in the US. One key barrier is the shortage of trained primary care providers, especially pronounced among internists. Our objective was to demonstrate the feasibility of an innovative strategy to integrate contraceptive implant and IUD provision into an internal medicine residents' procedures clinic.

SETTING AND PARTICIPANTS: The Rhode Island Hospital Center for Primary Care (CPC) located in Providence, RI is the main teaching site for the Brown Internal Medicine residency, including all 30 residents in the General Internal Medicine (GIM) program.

DESCRIPTION: Our strategy was to integrate contraceptive implant and IUD provision into an existing musculoskeletal and dermatologic procedure clinic. The faculty supervisor was already trained in contraceptive implants and IUDs. Approximately 2 residents rotate together for 2–3 sessions per month. Residents who elect to provide IUDs (approximately 2 out of 10 GIM residents per year) are offered additional training times. All residents interested in providing the contraceptive implant are offered the FDA-required 1.5 h training held twice yearly.

EVALUATION: Prior to implementation of our strategy, there were no residents at our program who were trained in contraceptive implants or IUDs. The faculty supervising the procedure clinic obtained institutional privileging in October 2015

and since that date we have provided 23 contraceptive implant insertions and/or removals and 21 IUD insertions and/or removals. A total of 14 residents and 8 faculty completed the FDA-required 1.5 h training. There have been a total of 6 out of 30 General Internal Medicine residents who have opted to pursue IUD training, and the 2 who graduate in 2017 will have achieved competence.
DISCUSSION/REFLECTION/LESSONS LEARNED: We succeeded in integrating contraceptive implant and IUD provision into an internal medicine residents' procedures clinic. Although we know of an increasing number of internal medicine residency programs that now offer the FDA-required contraceptive implant training to residents, we know of only one other residency program that integrates contraceptive implant and IUD training into the residency clinic, a handful of others that offer elective training in the faculty practice and none that integrate contraceptive implants and IUDs into a procedures clinic. We believe this innovative model, more common in family medicine than internal medicine, offers residency programs a useful mechanism for teaching core competencies in ambulatory procedures and women's health, both of which can be highly sought after by residency applicants.

TRAINING RESIDENTS IN NAMASTE - NEW ANXIETY MANAGEMENT ALGORITHM STANDARDIZING TREATMENT EXPERIENCE

Amy Weil; Diane Dolan-Soto. UNC Chapel Hill School of Medicine, Chapel Hill NC, NC. (Control ID #2704283)

NEEDS AND OBJECTIVES: While depression care in primary care is well established, anxiety is also common and often comorbid, but evidence based anxiety care algorithms have not been well established. Comorbid depression and anxiety is associated with higher levels of chronicity, increased medical utilization, slower recovery and greater psychosocial disability. Providers are less familiar with anxiety treatment and have had to rely on patients seeking external care. Benzodiazepine overprescribing can increase morbidity and mortality. Objectives: 1. Create an evidence based algorithm for anxiety care along with a medication guide. 2. After vetting with colleagues and experts create and deliver case based didactic sessions designed to equip providers to implement the algorithm. 3. Decrease inappropriate use of benzodiazepines for anxiety management by offering education and effective alternatives.
SETTING AND PARTICIPANTS: Our academic primary care outpatient clinic serves over 12,000 patients as a safety net for the state of North Carolina. Over 100 providers work in our clinic, including physicians, nurses, clinical social workers, clinical pharmacists and resident trainees.
DESCRIPTION: We created a novel training module using case based materials to introduce algorithms to diagnose and treat anxiety using the GAD7 along with a medication guide. This was vetted with colleagues and experts and then delivered twice to our resident trainees.
EVALUATION: After training providers and implementation of the program, we did several quality improvement projects to assess providers' fidelity to algorithmic guided anxiety care and to evaluate patients' treatment response. We have a pre-post survey in progress with our clinicians regarding their knowledge, skills and attitudes and export to report results by February 2017.
DISCUSSION/REFLECTION/LESSONS LEARNED: Already having an IMPACT inspired Depression Diagnosis and Treatment Program in our clinic sensitized us to the need for a similar approach for anxiety. We have seen great qualitative improvements in our trainees' ability to recognize anxiety and formulate approaches to care. Residents have been quick to learn about effective alternatives to benzodiazepines and offer them to patients. Patient care has improved as a result. We look forward to presenting quantitative results when available.

TRAINING TOMORROW'S LEADERS IN PRIMARY CARE: THE LEADERSHIP FOR URBAN PRIMARY CARE EDUCATION AND TRANSFORMATION PROGRAM

Anna Volerman; Michael T. Quinn; Julie Grutzmacher; Deborah L. Burnet. University of Chicago, Chicago, IL. (Control ID #2706779)

NEEDS AND OBJECTIVES: Primary care transformation is needed to effectively deliver high-quality, patient-centered, cost-effective care. Leading such transformation requires a robust understanding of health systems, care models, patient-centered practices, and data-driven population health management. A diverse, well-prepared workforce is needed to care for the increasingly diverse patient populations, and primary care leaders need strong skills for working with multi-disciplinary teams, aligning incentives, leading quality improvement, guiding change, and building collaborative networks. Our objective is to train a diverse primary care workforce and develop effective leaders for primary care transformation in urban communities.
SETTING AND PARTICIPANTS: Residents and faculty in the Departments of Medicine, Pediatrics, and Family Medicine at one urban academic medical center and its affiliated primary care sites.
DESCRIPTION: The Leadership for Urban Primary Care Education and Transformation Program (LUCENT) consists of three key components over one to two years. First, residents have enhanced ambulatory training to strengthen clinical skills specific to primary care. To broaden their experiences, residents have expanded ambulatory clinical training to include both academic and community-based primary care practices and also more than double the ambulatory time compared to other residents. Second, resident and faculty scholars participate in biweekly symposiums to develop knowledge and skills for primary care transformation and leadership. Symposiums include discussions about core topics in primary care transformation, workshops to build leadership skills, and presentations about primary care innovations. Lastly, each scholar leads a practice innovation project in their ambulatory setting with strong faculty mentorship to translate the knowledge directly into practice and impact patients and clinics.
EVALUATION: The first cohort of scholars began the program in July 2016. This group of 12 scholars includes six residents, one fellow, and five faculty. Their projects focus on: chronic pain, mental health, palliative care, pediatric obesity, and social determinants of health. Outcomes are measured annually based on an outcomes-logic model and target scholar, patient, clinic, and program levels. Short-term outcomes include scholars' knowledge and skills of primary care transformation and leadership, patient care access and delivery, disease outcomes, and attitudes about the program. Long-term outcomes include entry into primary care, implementation of transformative initiatives, and attainment of leadership roles.
DISCUSSION/REFLECTION/LESSONS LEARNED: The multidisciplinary program prepares resident and faculty physicians to advance primary care delivery and become leaders in today's ongoing transformation of primary care. Although the patient population and disease entities differ across specialties, the principles of primary care transformation and education are analogous and represent an opportunity for collaborative learning and training.
ONLINE RESOURCE URL (OPTIONAL): www.lucent.uchicago.edu

TRANSITIONS OF CARE: MOVING FROM THE DISCHARGE SUMMARY TO THE TRANSITIONS SUMMARY

Meghan K. Black[1]; Cristin Colford[1]; Benjamin J. Lyles[2]. [1]University of North Carolina Chapel Hill, Chapel Hill, NC; [2]University of North Carolina Chapel HIll, Chapel Hill, NC. (Control ID #2703684)

NEEDS AND OBJECTIVES: Currently there is an increased emphasis on patient safety and transitions of care in medical education. Discharge summaries are the accepted means of communication in the transition from inpatient to ambulatory care. We sought to improve discharge summaries by creating a session for Internal Medicine Residents with the following objectives: 1.Demonstrate knowledge of the components and structure of a thorough, organized discharge summary utilizing a standardized rubric 2.Transition patients effectively across health delivery systems (SBP4 Milestone) by recognizing components of a discharge summary that effectively facilitate safe transition of care 3.Utilize the electronic health record (EHR) to improve and standardize discharge summaries

SETTING AND PARTICIPANTS: The intervention is a one-hour workshop (held during a normally scheduled conference time) for residents responsible for creating discharge summaries.

DESCRIPTION: We created a 50-point scoring rubric using categories outlined by the ACGME PDQI-9 to assess the basic components, hospital course, discharge planning, and overall assessment of a discharge summary. The EHR was utilized to collect summaries from each resident written pre and post intervention and were graded using the rubric by the authors. The intervention is a workshop reviewing the basic components of a discharge summary and its role in transition of care from inpatient to ambulatory settings. In the workshop, residents work in small groups using the rubric to score sample discharge summaries. The scoring informs an interactive discussion of strengths and weaknesses. At the completion of the workshop, a standardized EHR discharge summary note template is reviewed and distributed.

EVALUATION: In a post-workshop survey, 100% of residents reported they learned tools to improve their discharge summaries. Preliminary evaluation of discharge summaries pre ($n = 84$) and 30 days post intervention ($n = 56$) using the rubric had median scores of 37 and 44 respectively ($p < 0.001$). The improvement was maintained at 60 days ($n = 79$) with median score of 44 ($p < 0.001$). Post intervention there was a 46% increase ($p < 0.001$) in use of the standardized EHR template. Analysis is ongoing.

DISCUSSION/REFLECTION/LESSONS LEARNED: This innovation changed our approach to teaching discharge summaries. We found that the interactive session was well received and helped residents understand the importance of the document's role in transition of care and less so for cataloging minute details of the hospital course. We highlighted the importance of a strong summary statement and discussion in a problem based format. In addition, as a transition document, we felt that it was key to add a section for outpatient follow up. In our review of the pre and post intervention discharge summaries, it was clear that the communication to outpatient providers was increased when the template was utilized. We learned that it is challenging to spread best practices such as using the preferred EHR template and that we needed to use a multifaceted approach to increase adoption.

U.S. MINI-MEDICAL SCHOOL CLINICAL CURRICULUM FOR CHINESE MEDICAL STUDENTS

Brian S. Heist[1]; Melissa McNeil[1]; Margaret C. McDonald[2]. [1]University of Pittsburgh Medical Center, Pittsburgh, PA; [2]University of Pittsburgh School of Medicine, Pittsburgh, PA. (Control ID #2695835)

NEEDS AND OBJECTIVES: Externships for international students at U.S. medical schools are often isolated to clinical or laboratory exposure. This neglects opportunity to provide more robust understanding of U.S. medical education to potential future physician leaders in their home countries. We developed and implemented a curriculum to teach Chinese medical students the spectrum of clinical training in our institution. Attention was paid to skills development, relevance to careers in China, and exploring the influence of culture, organization of healthcare, costs, and historical context.

SETTING AND PARTICIPANTS: Twelve students who just completed their clinical clerkships at Xiangya Medical School are participating in a 2 year laboratory based research program at the University of Pittsburgh School of Medicine (UPSOM). The affiliation between the two schools stipulates provision of clinically related activities.

DESCRIPTION: Cumulative 1 month of clinically focused training extracted from UPSOM MS1-MS4 curriculum. Specific activities were conducted in a sequence approximating the UPSOM curriculum and included: 1.Standardized patient interviewing and OSCE 2.Interviewing patients with follow-up case discussions 3.Observing primary care, resident clinic, homeless clinic, and subspecialty clinics 4.Lectures/discussions on history of American medical education and medical system, and health care costs including insurance system and high value care 5.Interviewing non-physician members of care team 6.Participating in inpatient rotations with oral presentation on rounds and writing progress notes

EVALUATION: Pre-, mid-, and post-course questionnaires were administered and small group discussions were conducted addressing: 1.Confidence in clinical skills addressed 2.Value of each activity to career as a clinician and educator in China 3.Aspects of clinical education perceived superior in our institution versus home institution and vice versa. Ultimately success will be measured via interviews with the students after they return to their home institution, and observation of individual practice and curricular changes in their institution.

DISCUSSION/REFLECTION/LESSONS LEARNED: Two sets of lessons were learned. 1. *Students' perceptions of this curriculum and what they learned from it* Themes included enhanced appreciation for: A)Professionalism and patient-centered communication with attention to emotion and honesty B)Learning environment that encourages trainees to express questions and thoughts C)Influence of cost and organization of care on health D)Enhancing clinical training with regular didactic sessions 2. *Challenges to implementing this type of curriculum* Lessons learned included: A)Financial issues such as logistics of funding allocation to participating faculty B)Legal and institutional policy constraints with regard to patient interaction privileges for international students and the impact of the curriculum on UPSOM student education C)Barriers to buy-in from faculty members within our institution D)Misconceptions about baseline language skill and medical knowledge of the participants

UPDATES IN SLOW MEDICINE: HOW A RESIDENT PRIMARY CARE CLINIC DISCUSSION WENT NATIONAL

Michael E. Hochman. Keck School of Medicine, Los Angeles, CA. (Control ID #2695337)

NEEDS AND OBJECTIVES: We define "slow medicine" as an evidence-based, parsimonious, and patient-centric approach to clinical care in which one is

careful in interviewing (and examining) patients, careful to balance benefits and harms of diagnostic and therapeutic interventions, slow to intervene when symptoms are undifferentiated, committed to observation as an important diagnostic and therapeutic strategy, and cautious about adopting new diagnostic tests and therapies until the evidence establishes their value. The primary objective of our educational intervention is to create a free resource to engage residents and trained clinicians in the practice of "slow medicine" by sharing regular concise summaries of the latest medical literature from a generalist "slow medicine" perspective.

SETTING AND PARTICIPANTS: "Updates in Slow Medicine" began several years ago as an informal discussion among resident physicians and attendings at a teaching primary care clinic. Over time, our initial group dispersed around the country, but continued our discussions by email, increasingly refining the "slow medicine" principles. In 2014, our emails became more formalized, and we began writing regular email "updates" on clinical developments that we distributed to trainees from our original residency program. Since then, "Updates in Slow Medicine" has evolved into a twice-a-week literature update to which more than 500 physicians from dozens of institutions across the U.S. and internationally have thus far signed up to receive.

DESCRIPTION: Each week, we send out approximately two concise summaries ranging in length from 250–750 words, which offer commentary on the week's most important clinical research findings from the "slow medicine" perspective. We also publish selected pieces as blogs with MedPage Today and the Center for Health Journalism. Topics we address are broad and range from the overuse of medical services such as antibiotics, screening tests, and imaging studies, to the management of conditions such as obesity, hypertension, and diabetes using lifestyle approaches.

EVALUATION: We have not formally evaluated our initiative. However, our group has grown organically by word-of-mouth to involve over 500 members, and our messages have an open rate of >60% (well above the "industry standard" for this type of group). Moreover, many "Updates" have been published as blogs and discussed in the mainstream media, and one was developed into a perspective piece for *JAMA Internal Medicine*.

DISCUSSION/REFLECTION/LESSONS LEARNED: There is an unmet need, which we have begun to address, to provide busy residents and practicing clinicians with concise, up-to-date summaries of the medical literature from a generalist "slow medicine" perspective. In addition, our intervention has triggered the development of an engaged network of clinicians interested in the "slow medicine" philosophy.

ONLINE RESOURCE URL (OPTIONAL): http://slowmedupdates.com

USING ILLNESS SCRIPTS IN A 1ST YEAR MEDICAL SCHOOL BASIC SCIENCE COURSE Eileen Hennrikus. Penn State College of Medicine, Hershey, PA. (Control ID #2703924)

NEEDS AND OBJECTIVES: 1. To provide a memory anchor for which basic science information can be retained 2. To integrate our 4 pillars of education: Scientific Knowledge, Clinical Practice, Humanities and Health Systems.

SETTING AND PARTICIPANTS: The first medical school course, Scientific Principles of Medicine, a three month course that lays the basic science foundation for the organ system courses. A class of 150 first year medical students.

DESCRIPTION: Each week two PBLs are integrated with the large group sessions. Each Friday, a patient with an illness studied in one of the PBLs is interviewed in front of the class of 150 students. Often spouses, family, and the patient's physician, or nurse-coordinator accompany the patient. The patient is given the opportunity to describe how they were diagnosed, the life adjustments that were required to live with the condition and the issues that arose during treatment. Time is allotted for questions from the student audience. Laptops must remain closed but notes can be taken with pen and paper. The following Sunday, a one page illness script must be downloaded to the assignment drop-box. The illness script is formatted with the textbook version in column 1 and the patient version in column 2. The categories addressed in each version are: predisposition/cause, presentation/complications, how diagnosed and treatments. The patient column has two additional categories: humanistic take-away and health systems issues.

EVALUATION: 95% weekly compliance. Quality write-ups. Student feedback was unanimously positive.

DISCUSSION/REFLECTION/LESSONS LEARNED: Thematic Student Comments: "The patients and illness scripts allow us to put a face to a disease, help to solidify learning and made learning relevant. " Each student discovered their own personal humanistic lesson. For example, "This was a good story for me to hear. I think that at times I am guilty of stereotyping individuals with particular illnesses, because I don't understand their situation. Really knowing the psychological stress of addiction may not ever be possible for me, but at least I can understand the perspective a little better, and hopefully be compassionate and non-judgmental enough to help, rather than hurt, to understand rather than dismiss." Health systems comments included the way patients were informed about illness, attitudes and treatments rendered by medical professionals, errors and missed diagnoses as well as lifelong relationships with medical personnel.

USING PLAIN LANGUAGE WITH PATIENTS: TRAINING RESIDENTS AND FACULTY IN HEALTH LITERACY TO PREVENT PROVIDER BURN-OUT Frances Norlock[1]; Darryl Woods[1]; Sherry Licht[1]; Laura Sadowski[2]. [1]Stroger Hospital of Cook County, Chicago, IL; [2]stroger hospital of cook county, Chicago, IL. (Control ID #2705876)

NEEDS AND OBJECTIVES: Residents had difficulty explaining medical concepts to patients - many who had low health literacy. Training in health literacy was never conducted at our institution and is required for maintenance of patient-centered medical home (PCMH) certification.The objectives were to: 1) train providers in health literacy as a universal precaution; and 2) teach participants the skill of using plain language to improve patient understanding resulting in decreased burn-out among providers.

SETTING AND PARTICIPANTS: Half-day workshops were held Monday through Friday for internal medicine residents and clinic preceptors. Patients were not were not scheduled during these sessions. Preceptors were trained on their role as small group moderators, the exercises and role play during the lunch hour prior to the workshop.

DESCRIPTION: Residents completed a 14-item Health Literacy Screen to assess baseline knowledge followed by a didactic session on health literacy as a universal precaution and using plain language when communicating with patients.

Small groups completed 2 exercises and 1 role play. During Exercise #1 pairs of residents explained osteoporosis, heart failure and anti-inflammatory to each other using plain language. During Exercise #2 small group members created an explanation using plain language for a colonoscopy, atrial fibrillation or hypothyroidism. Members participated in a role play using plain language to describe heart disease and how an angiogram is performed. Small groups debriefed using flip chart notes on how they would use plain language to describe a colonoscopy, atrial fibrillation or hypothyroidism and any challenges they faced furing the exercises.
EVALUATION: Eighty-five residents and 21 faculty participated. Residents' Health Literacy Screen mean score was 10.3 out of 14 and there were no significant differences between training years (PGY1 10.3; PGY2 10.0; PGY3 10.7; p-value 0.40). Qualitative analysis of the flip chart notes revealed most small groups chose to explain a colonoscopy. Common themes included using the word bottom instead of rectum or slang; camera on the end of a tube "like my stethoscope;" why it was important to have a colonoscopy, bowel preparation and need for an escort. Atrial fibrillation small groups used terms such as "heart seizure" and "when the heart beats irregularly a clot can form." Colonoscopy and atrial fibrillation groups used simple drawings to explain conditions. Hypothyroidism small groups used phrases "tells your body how fast or slow to work" and "the gland is working less than normal."
DISCUSSION/REFLECTION/LESSONS LEARNED: Participants appreciated learning how to speak in plain language with patients. International graduates were challenged to think of common words in place of medical terminology as many learned "medical English" not conversational English. Future goals: 1) teach "Teach Back" method Spring, 2017; 2) survey residents on their use of plain language and satisfaction; 3) conduct QI project using plain language intervention; and 4) create 50 item plain language thesaurus.

VIRTUAL REALITY SUPPLEMENTAL TEACHING AT LOW-COST (VRSTL): A MODEL AND REVIEW FOR DEVELOPING LOW-COST VR FOR MEDICAL EDUCATION Patrick Chang[3]; Benjamin Chen[3]; Malhar Parikh[3]; Catherine Jones[1]; Kathryn Bunting[3]; Chayan Chakraborti[2]; Marc J. Kahn[2]. [1]Tulane University SOM, New Orleans, LA; [2]Tulane University School of Medicine, New Orleans, LA; [3]Tulane University: School of Medicine, New Orleans, LA. (Control ID #2670876)

NEEDS AND OBJECTIVES: Currently, there is interest for expanding earlier clinical experiences in medical schools. While virtual reality (VR) has successfully been used for surgical training at the resident level, the high cost, low quality, and limited scalability have previously restricted its widespread use for medical education. The goals of the VRSTL pilot are to propose a model for harnessing low-cost VR film as an adjunct for clinical teaching, review the developmental process to allow for replication and showcase the benefits of VR as an education tool.
SETTING AND PARTICIPANTS: A series of low-cost VR films were developed and shown at the first year medical school level using smartphones and low-cost VR headsets.
DESCRIPTION: Low-cost VR film was integrated into a first-year medical education course that teaches a basic pulmonary exam that allowed learners to look with 360 degrees of freedom during viewing. A systematic review of technologies including, 360 cameras, online VR platforms and smartphones, was done based on criteria of ease of use and compatibility across technology. Three first person virtual reality films that allowed 3D depth perception were subsequently created. Pathological lung sounds, augmented reality diagrams and a multiple choice question were added over the user's field of vision. Ubiquitous smartphone presence on campus was explored as an educational platform by allowing half of learners to successfully view the film on their own smartphones.
EVALUATION: Three levels of low-cost smartphones, cameras and free online platforms were evaluated for ease of implementation and compatibility. Success was measured by integration of a VR film into a real class under budget that showcased VR's ability to add examples of pathology and active learning over the learners' field of vision.
DISCUSSION/REFLECTION/LESSONS LEARNED: Our first and second video demonstrated that low-cost virtual reality could be achieved for $12/student on a $2000 budget. We demonstrated that VR film may enable educators to provide learners with first-person examples of pathology(e.g. crackles, egophony, and wheezes) and education overlays. Animations and multiple-choice active learning through left-right options were further showcased. Learners using this model gain the ability to turn and look in 360 degrees throughout viewing a film. On reflection, the optimal use of this freedom of vision likely includes teaching situations that demand interplay with the environment. Examples may include practice scenarios where residents run codes and are required to interact in a 360 degree environment. While this pilot showed a range of additional teaching tools that VR may offer educators, this group believes VR is not a replacement for real clinical experiences. However, VR film is a versatile teaching adjunct that can be adapted to a multitude of situations. Technology is rapidly progressing, and institutions interested in replication should prioritize ease and compatibility across hardware.

VIRTUAL REALITY SUPPLEMENTAL TEACHING AT LOW-COST (VRSTL): RESULTS OF LOW-COST VR FILM AS TEACHING ADJUNCT FOR CLINICAL TEACHING AT THE MEDICAL STUDENT LEVEL Benjamin Chen[3]; Patrick Chang[3]; Malhar Parikh[3]; Catherine Jones[1]; Kathryn Bunting[3]; Chayan Chakraborti[2]; Marc J. Kahn[2]. [1]Tulane University SOM, New Orleans, LA; [2]Tulane University School of Medicine, New Orleans, LA; [3]Tulane University: School of Medicine, New Orleans, LA. (Control ID #2692643)

NEEDS AND OBJECTIVES: There is a rising call for increasing clinical experiences earlier in medical experience for which simulation may answer. Meta-analyses have suggested that technology-enhanced simulation introduced to surgical training are associated with improved speed and accuracy in outcomes. New advances in technology may now allow for low-cost VR to be used as a teaching adjunct for widespread educational use. However, there is limited literature on audience attitude and response toward this new technology. Herein, we report on results from the Virtual Reality Supplemental Teaching at Low-Cost(VRSTL) pilot. The objective is to explore results of this pilot study in which low-cost VR(virtual reality) film was integrated into a medical school course through subjective response and report on objective post-experience results.
SETTING AND PARTICIPANTS: A total of 183 students were randomized into control and VR groups in a first-year class. Half of students in the experimental group viewed the VR film prior to attending normal class, and half of students in control group did not. Informed consent was obtained from all participants and all participants could opt out at any time.

DESCRIPTION: A low-cost VR video was shown to experimental group from a first person perspective on smartphones. VR film is defined as using video presented from the first-person perspective with 360 degrees of view and depth perception creating an immersive virtual environment. VR film was augmented with pathological clinical sounds and educational overlays in the learners' field of vision.

EVALUATION: After viewing the VR film and/or the current curriculum, an 8 item post-viewing objective test and subjective/demographics survey was administered. All participants completed survey and testing.

DISCUSSION/REFLECTION/LESSONS LEARNED: The VRSTL pilot had a start up cost of $12/learner. Videos are reusable allowing for a scalable, sustainable database of videos to be created. Participants were receptive to this pilot, pending overcoming a initial operator curve. More students stated VR film was an easy transition from current curriculum(81%) and would be useful for review of skills during clinical wards(79%). Students were receptive to using VR film to prepare for in-house clinical exam and/or Step 2 CS review (64%). Demographic survey showed no difference between groups. There was no difference between groups on eight item post-session quiz ($p = 0.239$). A recent comparative study suggests that while addition of augmented reality may not lead to significantly different outcomes, it may serve to decrease the dispersion and variation among learner experiences. This may suggest that a benefit of VR can lead to a more standardized delivery of materials. Key limitations included operator dependence and motion sickness. Furthermore, this was a single-center study with small sample size. For institutions interested in replication, obstacles towards for audience adoption of VR film includes overcoming operator dependence through initial coaching for an optimal learning experience.

WELL-BEING BY DESIGN: USING DESIGN THINKING TO ENGAGE LEARNERS IN THE DEVELOPMENT OF INNOVATIVE WORKPLACE WELL-BEING INTERVENTIONS Larissa Thomas[2]; Rita Nguyen[2]; Elizabeth Harleman[2]; Catherine R. Lucey[1]. [1]UCSF, San Francisco, CA; [2]University of California, San Francisco at Zuckerberg San Francisco General, San Francisco, CA. (Control ID #2707135)

NEEDS AND OBJECTIVES: Physician well-being is a complex challenge requiring a multi-faceted approach to address individual and organizational influences. Design thinking, a strategy to develop human-centered solutions for complex problems, may help to generate new, authentic organizational approaches to enhance well-being. We developed a longitudinal program to engage residents in creating well-being interventions, using a design thinking framework with the following objectives: 1. Apply principles of design thinking to develop resident-driven initiatives that address organizational well-being challenges. 2. Use semi-structured interview techniques to identify and analyze well-being challenges and design interventions. 3. Develop personal empowerment and self-efficacy through the design thinking process.

SETTING AND PARTICIPANTS: 21 resident participants developed interventions for a large internal medicine residency program.

DESCRIPTION: At baseline 80 percent of participants had little/no familiarity with design thinking, and 90 percent had never developed well-being interventions. For eight months, participants attended a two-hour facilitated design session every other month, with independent work between sessions. In Session 1, participants learned design thinking principles and practiced interviewing to identify well-being themes. Each participant then conducted 1–2 interviews with non-participating residents or residents' family/friends. In Session 2, participants worked in teams to identify salient interview themes, including isolation and self-doubt, value of peer/program support for difficulties, and scheduling/time constraints. Teams then applied ideation brainstorming techniques to address the following chosen priorities: creating community, providing individualized and timely reflection opportunities, and strengthening peer support. Each team then selected an idea to test, implemented an experiment between sessions, and used feedback to repeat the design cycle and refine their projects in Session 3. In the final session, teams summarized results and provided recommendations to the program leadership.

EVALUATION: Participants identified themes from their own work during each session, and investigators further analyzed session content. Final evaluation in May 2017 includes a pre/post-survey using the Psychological Empowerment in the Workplace Scale and the Creative Self-Efficacy scale, and semi-structured exit interviews. Burnout will be measured in an annual survey and stratified by participation in the program.

DISCUSSION/REFLECTION/LESSONS LEARNED: Although impact on participants has not yet been evaluated, residents successfully developed and tested four innovations using this process. Though scheduling/time constraints were an important theme, all teams chose to focus on enhancing community and organizational support. While additional strategies should address workload, this result suggests that design thinking's emphasis on human-centeredness may identify new approaches for cultural and organizational well-being challenges.

WELLNESS IN RESIDENCY: TACKLING BURNOUT WITHIN OUR RANKS Ryan Guinness; Kanchi Batra; Evan Calabrese; Leonierose N. Dacuycuy; Jessica Lorenzana; Benjamin Kozak; Jenny Zhang; Deborah A. Chiarucci. Kaiser Permanente San Francisco, San Francisco, CA. (Control ID #2704294)

NEEDS AND OBJECTIVES: Perform a baseline assessment of burnout in an Internal Medicine Residency Program using the Maslach Burnout Inventory that measures three components of burnout: emotional exhaustion, depersonalization, and personal accomplishment. Ask residents to identify leading factors that have contributed to burnout symptoms and potential wellness interventions to help reduce levels of burnout. Implement a series of PDSA cycles for each wellness intervention, and select the most popular intervention(s) to extend to the larger group. Our goal is to decrease levels of emotional exhaustion and/or depersonalization by one tier or increase levels of personal accomplishment by one tier on the Maslach Burnout Inventory among residents by May, 2017.

SETTING AND PARTICIPANTS: Setting: Kaiser Permanente, Internal Medicine Residency Program, San Francisco, CA, USA. Participants: 40 Internal Medicine Residents.

DESCRIPTION: Burnout is very common among health professions, particularly during residency training. The hallmark features of burnout include a combination of emotional exhaustion, depersonalization, and a reduced sense of personal accomplishment. This can lead to negative repercussions for the individual experiencing burnout, the people for whom care is provided, and for the community at large. Incorporating wellness interventions into the graduate medical education curriculum could help trainees to deal more successfully with the stress of training, develop techniques to help his or her career, and potentially prevent physician burnout. Wellness interventions have been

demonstrated to help individuals more effectively manage stress, pain, and other health conditions.

EVALUATION: We will evaluate burnout among Internal Medicine residents at Kaiser Permanente, San Francisco, CA, USA using a codified questionnaire and proceed to implement a series of wellness interventions to reduce levels of burnout on a follow-up questionnaire over a 9-month time period.

DISCUSSION/REFLECTION/LESSONS LEARNED: Our baseline burnout assessment identified several sources of stress among residents that include (1) lack of time for self-care; (2) long work hours; (3) and self-judgement regarding level of competency. Interactions with co-residents was found to be the most protective. We attempted to implement a series of wellness interventions that were requested by residents in an effort to reduce levels of burnout over a 9-month period. These wellness interventions included pet therapy, forums to discuss emotionally difficult patient cases, small group mindfulness activities, meditation sessions, wellness speakers, and incorporating 10-min of protected outdoor time without technology for wards residents during the week.

WHAT DO YOU SAY? USING SCRIPT WRITING AS A TOOL TO TEACH CODE STATUS CONVERSATIONS Kathleen G. Anderson[3]; Meghan Connelly[1]; Kari Esbensen[2]. [1]Medstar Washington Hospital Center, Washington, DC; [2]Emory University Hospital, Atlanta, GA; [3]Medstar Georgetown University Hospital, Washington, DC. (Control ID #2704998)

NEEDS AND OBJECTIVES: Discussing code status preferences is a crucial skill for physicians, and developing appropriate language and ease with these sensitive conversations is challenging. Code status discussions (CSD) are routinely done by residents without training. Research has shown that trainees do not develop these skills through clinical experience alone, and formal training can improve competency. Interventions proposed thus far include online modules, multi-hour workshops, and lectures and have not focused on incorporating such training into one's own authentic voice. We present a novel, versatile method to help trainees develop their own "scripts" for holding CSD with the goal of refining individualized language to improve communication skills.

SETTING AND PARTICIPANTS: We use this teaching method at two academic hospitals (Georgetown University in DC and Emory University in Atlanta) and a large community teaching hospital (Washington Hospital Center in DC). Learners have been medical students and residents and include a substantial number of foreign medical graduates.

DESCRIPTION: Our approach asks learners to write down what they commonly say when having CSD (including pauses, enunciations, and casual phrases to capture one's authentic voice) and share this with the group. They then revise these scripts based on peer feedback and reflection to create a final written product fitting on a note card in their pocket. We use script writing and sharing to identify (by group discussion) key elements of CSD, share best practices or helpful phrases, and build confidence through practice. Different variations of this method have been used at each teaching site thus far.

EVALUATION: We are conducting a qualitative analysis of trainee scripts written before and after peer feedback and are surveying learners at 1 and 3 months post training to assess their frequency of use and comfort with scripts, self-reported skill improvement, and insights gained.

DISCUSSION/REFLECTION/LESSONS LEARNED: We have found script writing to be a powerful tool to help trainees develop content and language for CSD. It is especially valuable for trainees who speak English as a second language. This technique can be used in multiple settings (we have used it in academic and community teaching settings) and has been modified into a short teaching module on the wards or a longer formal communication workshop. The written scripts offer trainees a concrete work-product and may improve frequency of use and retention of skills learned.

WHEN DOCTORS SPEAK ANOTHER LANGUAGE: TEACHING RESIDENTS ABOUT THE LIMITED ENGLISH PROFICIENT EXPERIENCE Amanda Reeck; Christopher Moreland; Keri L. Richardson. UT Health San Antonio, San Antonio, TX. (Control ID #2687484)

NEEDS AND OBJECTIVES: The purpose of the exercise was to help participants identify challenges that patients with limited English proficiency face in navigating the health care system and find ways for them to change their practice.

SETTING AND PARTICIPANTS: Our team consisted of 2 hospitalists and a healthcare interpreter. We conducted our innovative immersion experience in 2 separate 1-hour sessions: one with internal medicine interns, and the other with 2nd/3rd-year residents.

DESCRIPTION: Participants each rotated through 3 stations at 10-min intervals. Each station paralleled a task that patients are often required to perform (filling out forms, learning a step-wise task like wound care, following instructions in sorting medications), all in the presence of a language/literacy barrier. We then facilitated a group debrief about what challenges they faced, comparing their responses to those faced by patients. Participants identified ways to change their practice to help minimize these barriers. We then shared evidence-based data about LEP patients and outcomes, and provided resources they could use during LEP encounters.

EVALUATION: Twenty-three interns participated in the first session, and 13 upper-level residents participated in a 2nd session; all submitted a post-exercise survey. All the PGY2/3 participants (100%) rated the exercise very to extremely helpful, compared to 57% of PGY1s, with 30% of PGY1s rating it somewhat helpful and 13% a little helpful. Most (92%) of PGY2/3s were very to extremely likely to change their practice, compared to 70% of PGY1s, with 22% somewhat likely and 8% a little likely to change. Themes from participants debriefing included frustration with the language/literacy barrier and appreciation how patients must feel. They identified ways they could specifically change their practice, including using interpreters, asking patients to repeat back information to check understanding, and screening for literacy before providing written material. In a follow-up survey 2–3 months later, 85% of respondents said the experience influenced them to change their practice to a moderate/considerable degree, and 65% responded they now used interpreter services very often or every time, as opposed to 41% prior to the exercise.

DISCUSSION/REFLECTION/LESSONS LEARNED: We developed and implemented an innovative LEP immersion experience to help learners understand the challenges faced by LEP patients, and helped them identify ways in which they could implement behavioral changes to improve outcomes. Participant responses suggested this also supported empathetic understanding of the LEP patient experience. Three months after the exercise, participants responded that they increased their use of interpreter services. We implemented

this exercise initially for internal medicine residents, and plan to repeat it with faculty. Our innovation can be generalized to learners at any level with minimal additional resources required for curricular integration.

X + Y: TIME FOR QI Krista M. Johnson[1, 3]; Wendy Fiordellisi[1]; Alexis Wickersham[2]; Carly Kuehn[1, 3]; Ethan Kuperman[1, 3]. [1]University of Iowa Hospitals and Clinics, Iowa City, IA; [2]Thomas Jefferson University Hospital, Philadelphia, PA; [3]Iowa City VA Healthcare System, Iowa City, IA. (Control ID #2706683)

NEEDS AND OBJECTIVES: Our previous IM resident quality improvement (QI) curriculum faced logistical obstacles. Only 28% of our residents reported QI experience and most lacked confidence in QI skills ($N = 75$). We took advantage of our new "x + y" schedule to redesign our QI curriculum with the following objectives: 1) to improve resident's skills and confidence in QI, 2) to actively participate in inter-professional team QI, and 3) to demonstrate scholarship in QI.

SETTING AND PARTICIPANTS: In July 2015, the IM residency program at the University of Iowa transitioned to a "4 + 1" schedule: a 4-week rotation followed by 1 week of outpatient clinic and ambulatory education, which included the new QI curriculum. Participants included all 76 IM categorical residents and 11 volunteer faculty mentors.

DESCRIPTION: Residents were divided into 10 teams based on their schedule and clinic site. Residents participated in an introductory QI workshop, performed their QI work asynchronously during a "QI half day" built into their schedule every 5 weeks, and met in a "QI working session" for brief didactics and team updates every 10 weeks. Assignments were delivered electronically and curricular materials stored on a common web portal. All residents participated in an inter-professional team-based QI project using the Institute for Healthcare Improvement Model for Improvement as a framework. All projects focused on continuity clinic improvements. Resident skills and confidence in QI were assessed using the QIKAT-R and a pre-post survey.

EVALUATION: During the first year, all of our residents participated in inter-professional QI ($N = 76$). Interim analysis of 19 QIKAT-R demonstrated an increase in composite scores from 15.9 ± 4.4 to 20.1 ± 4.2 ($p < 0.001$). Residents reported increased confidence in all QI domains tested and rated the educational value of the curriculum 4.0 out of 5 ($N = 53$). All teams presented their projects orally and 7 teams presented posters at the local Patient Safety and QI Symposium. Several specific team project outcomes have been implemented.

DISCUSSION/REFLECTION/LESSONS LEARNED: Keys to success include dedicated resident QI time, faculty mentors, early inter-professional engagement, and a culture that recognizes residents' contributions to QI. Challenges include maintaining team momentum and communication between working sessions, feasibility of some projects, and systems barriers in each clinic. Future plans include expanding targets to include clinical outcomes and promoting further resident scholarship.

YEAR-LONG NARRATIVE MEDICINE INTERVENTION TO IMPROVE INTERPROFESSIONAL PRACTICE IN THREE PRIMARY CARE PRACTICES Deepthiman Gowda[1]; Dorene Balmer[2]; Apurva Khedagi[3]; Tayla Curran[3]; Michael Mangold[3]; faiz Jiwani[4]; Rita Charon[1]; Urmi Desai[5]. [1]Columbia University College of Physicians and Surgeons, New York, NY; [2]Childrens Hospital of Philadelphia, Philadelphia, PA; [3]Columbia University, New York, NY; [4]University of Florida College of Medicine, Gainesville, FL; [5]Columbia University College of Physicians and Surgeons, New York City, NY. (Control ID #2706637)

NEEDS AND OBJECTIVES: Interprofessional education and practice (IPE/IPP) aims to enhance clinical outcomes, yet many interventions remain outside of clinical settings. Narrative Medicine implemented in clinical settings may be a particularly effective way to enhance IPE/IPP while reducing burnout given its focus on facilitating communication and strengthening relationships.

SETTING AND PARTICIPANTS: We enrolled sixty-five participants, including attending physicians, residents, nurses and other staff from three New York City clinics (family medicine, general medicine, and general pediatrics).

DESCRIPTION: In March 2016, we began a year-long program of monthly 30-min sessions during required team meetings. Sessions are facilitated by a trained expert in Narrative Medicine (DG) and involve discussing a text (e.g. poem, film, painting), writing reflectively, and sharing writing with others from a different discipline. Sessions are designed to develop attention, explore creativity and strengthen relationships.

EVALUATION: Observation notes are taken at each session by a junior researcher. Semi-structured interviews with participants are conducted at start, mid-point, and end of the intervention. Analysis of qualitative data occurs iteratively with data collection. An initial set of codes is developed and applied to qualitative data collected in the first 6 months. To augment qualitative data, we administer 4 pre- and post-intervention instruments to assess burnout (Maslach Burnout Inventory), engagement (Utrecht Work Engagement Scale), empathy (Interpersonal Reactivity Index), and team characteristics (Team Development Measure). We conducted 40 sessions in the first 8 months. The average attendance was 10 participants. Sessions were attended by participants from all major disciplines. Early experience led us to adopt different texts (e.g. spoken word, illustrations) to appeal to all team members and fit within session constraints. Preliminary analysis of 40 observation notes and 22 interview transcripts reveal that team members across the disciplines and levels of educational attainment are open to active participation in sessions. In keeping with tenets of Narrative Medicine, team members speak of strengthening attention, valuing creativity, and enhancing relationships. At baseline, scores for burnout were higher for attending physicians, while scores for other instruments were comparable. Pre-post differences will be available by conference date.

DISCUSSION/REFLECTION/LESSONS LEARNED: Narrative medicine appears to be a feasible and effective intervention for IPE/IPP in clinical settings and may impact burnout. Our preliminary data suggest that interdisciplinary team members gain valuable insights about self, colleagues, and patients while strengthening relationships.

INNOVATIONS IN CLINICAL PRACTICE (ICP) IMPROVING HEPATITIS C SCREENING IN BABY BOOMERS AT ECMC PRIMARY CARE CLINIC: QUALITY IMPROVEMENT PROJECT Tenzin D. Arya[2]; Smita Y. Bakhai[1]. [1]SUNY at BUffalo, Williamsville, NY; [2]University at Buffalo, Buffalo, NY. (Control ID #2691292)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): 4–5 million people in the US have hepatitis C virus infection and CDC estimated 75% of adults infected with hepatitis C are people born from 1945 through 1965

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Our aim was to improve hepatitis C screening rate from 5% baseline to at least 10% within 6 months.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Hospital based primary care clinic, 40 residents, 2 providers and inner-city patient population.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Institute of Medicine's six aims of changing healthcare system, STEEEP (safe, timely, effective, efficient, equitable and patient-centered) was used to design our project. We used Plan Do Study Act (PDSA) model and root-cause analysis using fishbone diagram in a group discussion with preceptors and residents to identify barriers. System barriers included lack of electronic database and EMR alert of high risk patients. Provider barriers included lack of knowledge about the hepatitis C screening criteria, lack of reminders to ask for screening, and extra time needed during patient visits for education and consent. Patient barriers included lack of knowledge about hepatitis C and importance of screening, patient refusal of blood draws, lack of transportation. Our PDSA included provider education using a PowerPoint presentation and small group discussion for 40 residents rotating through ECMC IMC clinic. EMR workflow for nursing documentation of verbal consent of Hepatitis C was also reviewed with the residents. Nursing education was provided to increase documentation of verbal consent in EMR. In order to address barriers such as physician reminder and patient education we posted Hepatitis C screening information in each clinic room and distributed Hepatitis C educational handouts to eligible patients upon discharge from the clinic. Process measure included identifying high risk patients, education and offering hepatitis C screening test. Outcome measure included monthly hepatitis C screening rate. Balance measure included cost of the test and increase in referrals to liver specialist after confirmation of chronic hepatitis. We performed data analysis using monthly run charts.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Data analysis was performed using monthly run charts. Hepatitis C screening increased after the first PDSA cycle that included physician education from a baseline of 3.79% in Oct 2015 to 13.80% in Nov. 2015. We observed decline in Dec.2015, rate of 6.89 and increased to 11.24% in January 2016 after nursing education. Rates were dropped to 6.99% in Feb 2016 but again picked up in March 8.19 and April 11.58%.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Team based approach is crucial in improving screening rates for hepatitis C.

30-DAY ED VISIT AND READMISSION RATE AFTER A HOSPITAL AT HOME ADMISSION VS TRADITIONAL HOSPITALIZATION

Christian Escobar[1, 1]; Tacara N. Soones[1]; Bruce leff[2]; Janeen Marshall[1]; Gabriel Silversmith[1]; Albert L. Siu[1, 1]; Ania Wajnberg[1, 1]; Linda DeCherrie[1, 1]. [1]Icahn School of Medicine at Mount Sinai, New York, NY; [2]Johns Hopkins University School of Medicine, Baltimore, MD. (Control ID #2699980)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Although almost 20 percent of Medicare beneficiaries hospitalized for an acute illness are readmitted within 30 days at an estimated cost of $17.4 billion, data is lacking on the impact of substituting Hospital at Home (HaH) plus HaH transitional services for traditional hospitalization on post-discharge outcomes.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. To demonstrate clinical feasibility of a 30-day transitional care period following discharge from a HaH program. 2. To compare 30-day ED visit and readmission rates following discharge from this new HaH program based at Mount Sinai with those of a group of comparable patients discharged from Mount Sinai Hospitals.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The Icahn School of Medicine at Mount Sinai implemented a HaH program funded by a Health Care Innovation Award from the Centers for Medicare and Medicaid Services' Innovation Center (CMMI), the Mobile Acute Care Team (MACT). The MACT deploys a multidisciplinary team to provide acute-hospital level care in the home as a substitute for traditional inpatient care and provides additional post-acute transitional care services for 30 days after discharge. Transitional services include skilled nursing visits to assist with continuing medical needs; social work support; clinician oversight, telephonic guidance, and urgent visits; and labs and imaging as needed. All patients receive 24-h access to a physician by phone for questions or urgent issues during this 30-day period.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The MACT study is a controlled clinical trial of MACT HaH participants with concurrent controls. Patients enrolled as concurrent controls meet MACT HaH admission criteria but either were admitted to the hospital during hours when MACT HaH was not enrolling new patients or refused MACT HaH admission. Key measures include: demographics and hospital diagnosis as well as 30-day ED visit and readmission rates.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Between February 1, 2015 and October 31, 2016, 101 patients were admitted to MACT HaH and consented to research participation, 137 patients were enrolled in the control arm. Demographics for both groups: Age >65 = 79% MACT vs 72% controls; Sex = 79% female MACT vs 62% female for controls; Race = 30% White, 23% Black, 40% Hispanic for MACT vs 30% White, 29% Black, 35% Hispanic for controls. For MACT vs control participants, 30-day ED visit rates post-discharge were 6 (5.9%) vs 14 (10.2%), respectively ($p = 0.34$), and 30-day readmission rates were 8 (7.9%) vs 20 (14.6%), respectively ($p = 0.15$).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): MACT transitional services for 30 days after an acute episode is clinically feasible. In early data, MACT patients experienced fewer readmissions and ED visits within 30 days of discharge than similar, hospitalized patients, though this is not yet powered to reach statistical significance. As compared with hospitalization, providing hospital level care in the home paired with a 30-day post-acute care program may have the potential to reduce hospital readmissions and ED visits within 30 days of an acute illness.

A BRIEF INTERPERSONAL PSYCHOTHERAPY PROTOCOL TO IMPROVE TREATMENT OUTCOMES IN A PRIMARY CARE DEPRESSION CARE PROGRAM.

Lauren Peccoralo[3]; Samantha Herrera[1]; Lizbeth Valencia[1]; Katherine Small[2]. [1]Icahn School of Medicine at Mount

Sinai, New York, NY; [2]Mount Sinai, New York, NY; [3]Mount Sinai School of Medicine, New York, NY. (Control ID #2705497)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Patients in our depression care program were not meeting treatment goals and had poor adherence to the program. Needs assessment revealed lack of standardization of psychotherapeutic treatment protocols due to difficulty engaging patients in the traditional Problem Solving Therapy.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To standardize psychotherapeutic treatment protocols using an innovative approach To increase rates of depression improvement and remission, assessed via PHQ-9 scores To achieve greater patient retention

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The Internal Medicine Associates (IMA) Practice at Mount Sinai in New York offers a depression care program for outpatients with PHQ-9 scores of greater than 9. IMA is a large urban academic practice with 140 resident providers, 9 Nurse Practitioners, and 30 faculty, serving approximately 18,000 patients annually. The depression care team consists of two depression care managers (master's level social workers), a social work supervisor, an administrative coordinator, a physician champion and a physician program director. The goal of the program is to improve depression symptoms via education, talk therapy and skill building in a time-limited approach. In response to not meeting treatment goals and high drop out rates, we created a new therapeutic protocol using the principles of interpersonal psychotherapy (IPT). This abbreviated 13-session version of IPT comprised meeting with care managers (weekly, biweekly, then every 3 weeks) and focused on pre-set goals and skill building during sessions.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Clinical outcome data following the IPT program (2016) were compared to historical data (2015). Depression improvement rates were defined as the percent of patients 70 days post enrollment with a PHQ-9 score of less than half of their original score or < 10. Remission rates measured how many patients reached the goal PHQ-9 score (<10). Average change in PHQ-9 scores was compared using a two-tailed t-test and proportions were compared using chi-square analysis. The percentage of patients discharged due to no shows was also calculated.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): There were 214 patients enrolled in the IPT program and 147 patients from the historical cohort. Depression improvement rates improved steadily from 31% (2015, Q3), to 49% (2016, Q3). The annual remission rate for all patients treated in years 2015 and 2016 was 29 and 42%, respectively ($p = 0.008$). The average decrease in PHQ-9 scores was −3.6 in 2015 and −7.8 in 2016 ($p < 0.005$). Of the discharged patients, 49 (70%) in 2015 and 30 (28%) in 2016 were discharged due to no-shows to appointments.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): An IPT-based therapeutic protocol resulted in higher remission rates and greater improvements in PHQ-9 scores in an urban primary care depression care program. Patients were also more likely to adhere to the program and less likely to be discharged due to no shows. Some limitations of this project include that some patients had difficulty adhering to frequent appointments and the subjective nature of the PHQ-9 as the marker for improvement of depression.

A COLLABORATIVE TELEHEALTH ANTIDEPRESSANT MONITORING PROGRAM INVOLVING PHARMACISTS IN PRIMARY CARE Shubha Bhat; Zeta Chow; Lauren Heath; Sarah Billups; Katy E. Trinkley; Danielle F. Loeb. University of Colorado, Aurora, CO. (Control ID #2706276)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Due to suicidality risk and frequent antidepressant self-discontinuation, guidelines recommend monitoring patients within two weeks of antidepressant initiation or uptitration, but limited resources and time constraints in primary care are barriers to systematic follow-up.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Clinical pharmacists and primary care providers (PCP) collaborated at two internal medicine clinics to provide a telehealth monitoring program to improve outcomes of depression therapy and minimize suicide-related medical liabilities.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Patients 18 years or older diagnosed with depression and instructed by their primary care team to initiate or increase an antidepressant were identified by automated reports and called by the clinics' pharmacists within two weeks. With each call, patients were asked if they made the antidepressant change or accessed specialty care if referred, and screened for adverse effects and suicidal ideation. If applicable, pharmacists assessed patients' reasons for not following providers' instructions. Pharmacists then worked with the care team to identify interventions to optimize patients' care and therapy. All calls were documented in the electronic health record. Patients with multiple antidepressant changes were outreached more than once.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Program evaluation metrics included proportion of calls the patient was reached; proportion of patients with non-adherence, adverse effects, and suicidal ideation; and type and frequency of pharmacist interventions.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Of 490 calls attempted between May to October 2016, 298 were successfully completed to 258 unique patients, primarily after antidepressant initiation. Patients reached were predominantly female with moderate-to-severe depression and mean age of 54 years. Patients reported antidepressant non-adherence during 56 (19%) calls, primarily due to adverse effect concerns. Patients reported adverse effects, such as mood instability, sleep disturbances, and nausea/vomiting, during 81 (27%) calls, and expressed suicidal ideation during 13 (4%) calls. One patient expressed new onset ideation after antidepressant change, self-discontinued the antidepressant, and was instructed to follow-up with PCP. Pharmacist interventions included reinforcing initial plan for 60 (20%) calls, recommending new administration time for 9 (3%) calls, and recommending new medication or dosing regimen for 5 (2%) calls. Of 68 scenarios where specialty care was ordered, patients reported not accessing it in 31 (46%) instances, citing transportation, work, and lack of scheduled appointment as main reasons.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A pharmacist-PCP collaborative telehealth monitoring service can identify patients needing early interventions after changing antidepressants

to optimize adherence, mitigate adverse effects, and minimize suicide risk. Developing specific and sensitive reports for patient identification was time consuming, but critical to the success of this program.

A DIABETES SELF-MANAGEMENT CLASS FOR MEDICALLY COMPLEX COMMUNITY-DWELLING ELDERS Cynthia Schoettler; Elizabeth Stanton; Mary Ann Graham; Jonathan Burns. Cambridge Health Alliance, Cambridge, MA. (Control ID #2698763)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Elders with diabetes often have diabetes related knowledge and skill deficits, negatively impacting the management of their diabetes. These elders, especially those with complex medical needs, are rarely offered self-management education, despite evidence to the contrary that this type of intervention can be meaningful.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The objectives of this project were to, 1) Identify diabetes knowledge and skill deficits in elders, 2) Develop a reproducible diabetes self-management class targeted for medically complex elders aimed at filling the identified deficits, and 3) Improve patient self-efficacy, attitudes, and skills in diabetes self-management.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): All participants were active enrollees in a Program of All inclusive Care for the Elderly, or PACE (nursing home eligible community dwelling seniors) in the Boston metro area affiliated with Cambridge Health Alliance, an academic community healthcare system. All participants had a diagnosis of diabetes and no known dementia. A class series of diabetes education for older adults with complex medical needs was developed after focus meetings with providers at the clinic site and conversations with participants. It was identified that participants lacked: a usable definition of diabetes, ability to identify and treat hypoglycemia, what is meant by 'exercise', and adequate nutrition knowledge. A series of six 1-h classes taught once weekly was created to address these deficits. At the end of the series, participants were given a binder with handouts covering the class topics and additional reference information.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): To assess the impact of this class, traditional quality measures of diabetes (such as A1c, weight, BMI and blood pressures) were recorded before and 3 months after completion of the class. Additionally, a pre-post survey for participants was administered, assessing patient knowledge of diabetes management and confidence in selected diabetes self-care activities.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Participants overwhelmingly reported that they felt the class was interesting and helpful for them. They reported feeling more empowered to care for their diabetes. Class attendance averaged 3–4 of the 6 classes and was limited by logistics as well as comorbidities (2 of the 6 participants were hospitalized for 1 or more of the classes). Overall there was slight improvement in knowledge and confidence in management of diabetes, especially in the ability to identify and treat hypoglycemia. 3 month follow-up of clinical measures is pending at this time.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A diabetes self-management class targeted for cognitively intact medically complex community-dwelling elders is well accepted by patients and results in improved perceptions of self-efficacy. Classes are inherently patient-centered, and a logical adjunct to complex adults who need ongoing case management.

A MULTIDISCIPLINARY CONTINUUM OF CARE MODEL FOR ALCOHOL USE DISORDER Marlene Martin[1, 2]; Michael Hutchinson[3]; Mira Parwiz[3]; Anjanette Devito[3]; Thomas Ormiston[1, 2]. [1]Santa Clara Valley Medical Center, San Jose, CA; [2]Stanford University School of Medicine, Stanford, CA; [3]Substance Use Treatment Services, Santa Clara, CA. (Control ID #2702157)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Validated screening tools for alcohol use disorder (AUD) exist, but have not been routinely used in hospitalized patients, limiting evaluation and treatment of patients with AUD.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Establish a workflow to address AUD that includes universal screening, training social work (SW) in screening, brief intervention, and referral to treatment (SBIRT), and initiation of medication assisted treatment (MAT) in qualifying and amenable patients. 2. Description of demographics, comorbidities, socioeconomics, and referral rates for hospitalized patients with AUD to better target services to these patients. 3. Programmatic evaluation of AUD screening, including referral rates for outpatient treatment, treatment modalities, and identification of barriers to accessing substance use treatment services (SUTS).

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The Alcohol Use Disorders Identification Test C (AUDIT-C), a three-question screening tool, was added to the medicine admission order set. Admitting nurses screen medicine patients for at risk drinking and refer those screening positive to SW. SW further screens patients for AUD and performs SBIRT. High-risk drinkers and those expressing interest in outpatient services or residential treatment are referred to higher levels of care. Medicine teams assess patients expressing interest in MAT for gabapentin and/or vivitrol and offer qualifying patients appropriate medication(s), giving first dose(s) during hospitalization. Patients receiving vivitrol are referred to SUTS and provided outpatient follow-up for continued intervention, assessment for a higher level of care, and continued vivitrol doses.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Describe the a) screening rates for AUD b) percentage of patients who screen positive for at risk drinking and receive SW intervention c) percentage of patients with AUD offered treatment d) percentage of patients who qualify for MAT and receive medication at discharge e) percentage of patients who receive vivitrol and follow up for monthly injections and f) pre and post intervention 30 day and 6 month emergency department visits and readmission rates.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): In preliminary findings, 1200 patients were

screened for at risk drinking in 4 months. 360 (30%) of these patients screened positive for at risk drinking. 80 (22.2%) patients who screened positive for at risk drinking and had AUD received SBIRT. 35 (43.8%) of the 80 patients with AUD received vivitrol. 17 (48.6%) patients followed up 1 month post discharge for further intervention and vivitrol. Of the patients who received vivitrol, 40% are homeless and 30% have a psychiatric comorbidity.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Engaging inpatient and outpatient stakeholders who care for patients with AUD has resulted in an inpatient and outpatient workflow to address AUD. By partnering with inpatient pharmacists, nurses, SW, and outpatient SUTS we are attempting to create a model to streamline identification of patients with AUD, and referral of these patients to behavioral and medical interventions.

A NOVEL DECISION AID TO ENCOURAGE SMOKING CESSATION AMONG PATIENTS WITH LOW HEALTH LITERACY Sumit Agarwal; Matthew Kerwin; Jacob Meindertsma; Andrew Wolf. University of Virginia, Charlottesville, VA. (Control ID #2703245)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): No decision aids that readily individualize the benefits of smoking cessation are available to help physicians engage in a meaningful conversation with their patients, particularly those with low health literacy, in order to explore and encourage a quit attempt.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): − Examine patient receptiveness to a unique smoking cessation decision aid - Advance patients' readiness to quit - Increase quit rates and reduce smoking prevalence

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): In an outpatient primary care clinic that serves a predominantly underserved patient population, active smokers were randomized to a control arm in which patients received standard of care (i.e. smoking cessation counseling using motivational interviewing techniques) and an intervention arm in which patients received standard of care plus the use of a decision aid. Because it targets a low health literacy population, the decision aid is simple and provocative; it seeks to both personalize and heighten the perceived benefits of quitting by using the poignant image of birthday cakes to display the potential years of life gained by quitting at the patient's current age. The decision aid is readily accessible as a web application and easily adaptable to a mobile platform as well as printable for the patient to take home with them.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The Biener and Abrahms Contemplation Ladder (based on Prochaska and DiClemente's Stages of Change), a well validated scale, was used to capture subtle but meaningful changes in thinking that can influence future quit attempts in the future. To determine the effect of the intervention, patients placed themselves on the scale before and after the intervention at pre-specified time intervals.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): After two months of recruitment, 63 patients were enrolled in the study, twenty-nine in the control arm and thirty-four in the intervention arm. Fifty-six percent of patients who received the decision aid reported not knowing they could live longer if they quit smoking. Eighty-five percent of patients found the decision aid to be useful, and one-hundred percent found it easy to understand. Among all the enrolled patients, 24% of those in the intervention arm moved up the ladder toward smoking cessation compared to 21% of those in the control arm ($p = 0.81$). Enrollment is ongoing.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Low-literacy patients are highly receptive to the use of a visual and personalized decision aid that highlights the positive impact of smoking cessation when talking with their physician. More patients must be enrolled, and with long-term follow-up, to determine whether the decision aid has the potential to enhance motivational interviewing and influence readiness to change or quit attempts.

A PILOT MULTIDISCIPLINARY CHRONIC PAIN CONFERENCE FOR COMPLEX, HIGH-UTILIZING PATIENTS Venkatesan R. Krishnamoorthi; Nicole Gier; Joyce W. Tang; David Dickerson; Magdalena Anitescu; Lauren Wiklund; David Meltzer. University of Chicago, Chicago, IL. (Control ID #2706837)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Delivering chronic pain care to high-utilizing, socially complex patients is challenging, and care fragmentation contributes to uncoordinated pain management, frustration in the provider-patient relationship, and opioid over-use.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1)Create a multi-disciplinary conference to discuss the complex factors contributing to patients' chronic pain experiences. 2)Develop multi-modal care plans and review cases longitudinally. 3)Improve collaboration and foster learning across disciplines.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The conference began in 2015 and was modeled after other disease-specific conferences, such as "tumor boards." Participation hailed from: Primary Care, Pain Medicine, Physical Therapy, Psychology, Social Work, and Pharmacy. Eligible patients were enrolled in the University of Chicago Comprehensive Care Program (CCP), which offers outpatient and inpatient continuity care for high-utilizers. Among CCP patients, 63% report moderate to extreme daily impairment from pain. Three new patients were selected for discussion by primary care physicians at each conference. Subsequently, a comprehensive care plan was developed for each patient, including: 1)testing, 2)medications, emphasizing alternatives to opioids 3)procedures, 4)physical therapy, and 5)behavioral health.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Participants in the conference were surveyed at two time points (4 months apart) to assess evolving attitudes in caring for chronic pain patients. Participants rated their skills in caring for chronic pain; satisfaction with resources and support; and perceived barriers in the provider-patient encounter. Participants provided qualitative responses on the impact of the conference on their approach to chronic pain, relationship with patients, and relationships with other conference collaborators.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): At baseline, all provider survey respondents ($n =$

12) agreed that chronic pain encounters take longer than other visits. Of note, 50% percent felt frustrated after these encounters; all respondents noted a lack of institutional support with chronic pain management; 50% felt they were a part of an effective team in addressing chronic pain. At four-month follow-up 77% of participants ($n = 11$) felt part of an effective care team addressing chronic pain. From qualitative responses, providers felt more supported in providing chronic pain care and detailed new approaches in their encounters ("I focus more on what type of life the patient wants…"). Many noted a positive impact on their relationship with patients ("less antagonistic"). Lastly, attendees highlighted stronger inter-departmental relationships, improved care coordination, and better understanding of the roles and barriers of various care team members.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A multi-disciplinary conference for chronic pain patients has improved collaboration across different specialties and has had an early positive impact on providers' relationship with their patients. The potential for increased provider satisfaction to result in improved patient experience will be assessed longitudinally.

A POPULATION-HEALTH BASED APPROACH TO ADVANCE CARE PLANNING Jared Lowe; Azalea Kim; David Chermak; Desmond Cutler; Christine Bates; Jenny Van Kirk; Lawrence A. Mumm; Ashley Hanlon; Laura Miller; Manisha Bhattacharya; Lynn Bowlby; Lawrence Greenblatt. Duke University Health System, Durham, NC. (Control ID #2679017)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): There lacks a population-health based pathway for advance care planning (ACP) that engages primary care practices.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Assist primary care providers (PCPs) with identifying patients who might benefit from ACP 2. Build functional pathways for PCPs to engage in ACP in the clinic setting

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We modified a published five-year mortality index to develop a predictive tool that identifies patients who would most benefit from ACP based on meeting one of three criteria extracted from the electronic health record (EHR): age 70 or greater; two or more hospitalizations at an affiliated hospital in the last year; three or more chronic co-morbidities based on ICD-9 codes. Patients age 50 or younger were excluded. We implemented this predictive tool at two primary care practices that serve a disproportionate share of underinsured and uninsured patients in Durham, NC. A list of identified patients was sent to a sample of residents selected on a volunteer basis who are the PCPs for those patients. PCPs reviewed their patient lists and marked patients as appropriate for ACP intervention. If deemed inappropriate, PCPs provided a brief justification via email. Patients identified as appropriate will be scheduled for dedicated ACP appointments. The schedulers will be provided a script for conversations with patients and an FAQ sheet to answer questions. For questions not covered, patients will be encouraged to ask their PCP. A trained medical assistant will be present in clinic to assist patients with completion of legal documentation, notarization, and uploading the documents to the EHR.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The predictive tool will be evaluated by measuring the percentage of patients identified by the tool that the PCPs agree are appropriate for ACP. The program will be evaluated by measuring among our identified ACP opportunities the rate of scheduling and completion of ACP appointments, presence of ACP documentation in the EHR, and changes in providers' attitudes and perceived barriers to ACP.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A total of 132 patients served by fifteen PCPs were identified. Of those 132 patients, the tool appropriately identified 113 (86%) for ACP intervention. Two patients were flagged by their PCPs as unsuitable based on perceived good health, and 11 had previously engaged in ACP. Of the 19 labeled inappropriate, 11 had not been seen at the clinic in over twelve months and were lost to follow-up, 4 were deceased, and 4 had significant cognitive impairment.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): This program demonstrates that a simple predictive tool capitalizing on the EHR is able to accurately assist PCPs with identifying patients appropriate for ACP. Building functional pathways in the clinic that assist with scheduling patients for ACP appointments and with completion of documentation will be necessary to engage primary care practices in ACP.

A PROPOSED SINGLE-CENTER DELIVERY PROGRAM FOR NALOXONE FOR PATIENTS DISCHARGED FROM ACUTE HOSPITALIZATION AT HIGH RISK FOR OPIATE OVERDOSE Salina Bakshi[1, 2]; Anish Mehta[1, 2]; Sheridan Reiger[1, 2]; Elizabeth Harry[1, 2]; Rajesh Patel[1, 2]. [1]Brigham and Women's Hospital, Boston, MA; [2]Harvard Medical School, Boston, MA. (Control ID #2706121)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Healthcare facilities have a responsibility to minimize harm from opiate-related adverse events (ORAE) among patients discharged from the hospital.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): (1) Identify high-risk patients discharged from acute hospitals; (2) Deliver naloxone to the bedside of high-risk patients prior to discharge; (3) Train patients and their caregivers on how to use naloxone prior to discharge.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Opiates pose significant risk for patients, particularly in the outpatient setting. [1] Opiates are one of the major drug causes of emergency department visits. [2] Intranasal or intramuscular naloxone available in the community can reduce harm from ORAE. We seek to systematically deliver naloxone to high-risk patients before their discharge from hospital. High-risk patients are defined as those with opioid prescriptions exceeding 50 daily morphine equivalents, dually-prescribed opiates and benzodiazepines, a history of opiate dependence/abuse, or ORAE as primary reason for hospital admission. Our hospital is a major academic center in Boston, MA with over 46,000 annual discharges. We are working to implement an electronic medical record (EMR) tool that will identify patients at high-risk and notify their provider that the patient is a candidate for bedside naloxone delivery before to their discharge. If the provider agrees, this will prompt the

automated creation of an outpatient naloxone prescription. This prescription will be sent to our outpatient pharmacy, who will deliver naloxone to the patient bedside and educate patients on its use. [1] Ballantyne, Jane C., and Jianren Mao. "Opioid therapy for chronic pain." *New England Journal of Medicine* 349.20 (2003): 1943–1953. [2] Shehab, Nadine, et al. "US emergency department visits for outpatient adverse drug events, 2013–2014." *JAMA* 316.20 (2016): 2115–2125.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We will follow patients discharged from the hospital who utilize our program and a control group of patients who are discharged from a similar ward who do not participate in our program. The primary outcome will be the number of high-risk patients with naloxone prescriptions on outpatient medication lists at discharge. The secondary outcomes include the number of hospital visits due to ORAE, number of naloxone teachings performed, in-hospital mortality, and all-cause mortality.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The program is in the process of being implemented in our intervention arm, and findings will be discussed and disseminated as data is acquired.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): We have created a model for collaboration between medical, pharmacy, and nursing staff to minimize harm from ORAE. We have identified how to leverage information in the EMR to identify patients at high-risk of ORAE. If successful, we believe this program is replicable.

A TIERED APPROACH TO TRANSITIONING YOUNG ADULTS WITH MEDICAL COMPLEXITY OR INTELLECTUAL DISABILITY TO ADULT CARE Sophia Jan[1, 2]; Caren Steinway[2]; Adam Greenberg[2]; Dava Szalda[2, 1]; Katherine Wu[2, 1]; Rebecca Kim[1]; Symme W. Trachtenberg[2]. [1]University of Pennsylvania, Philadelphia, PA; [2]Children's Hospital of Philadelphia, Philadelphia, PA. (Control ID #2708169)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): For young adults with medical complexity and/or intellectual disability (ID), few care models exist to coordinate the transition of primary and specialty care, home health, medical supply, and medical decision-making needs.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To increase the safety and coordination of pediatric to adult healthcare transfers of complex adult patients through a tiered and multi-model population-based intervention.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Between Oct 2015 and Dec 2016, we partnered with 7 medical and surgical divisions in a free-standing children's hospital and neighboring adult medical system to identify transition champions; pilot EPIC-based clinical decision supports (CDS); develop transition guidelines; identify adult providers; and run psychoeducational workshops for patients and families. Adult patients with 2 or more specialists or ID could be referred to MINT, a multidisciplinary clinical team consisting of Med-Peds trained physician, adult nurse practitioner, social worker, and youth community health worker (Figure 1). We developed an EPIC-based CDS consisting of a Best Practice Alert and Smartset that could include transition coordination in the problem list, transition information in after visit summaries, link to medical record release & transition readiness assessments, consult social work and MINT if eligible.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Measures tracked include GotTransition's *Health Care Transition Process Measurement Tool* (*HCTPM*), process measures, feasibility and acceptability measures, transitions completed and healthcare utilization.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): At the start of the intervention period, scored low on HCTPM. As of Dec 2016, we identified transition champions in all partner divisions and 6 additional divisons who meet quarterly. Six of the 7 original divisions are using the CDS; 4 new divisions are testing the CDS. Two divisions have final transition policies; 4 have drafted policies. Seven psychoeducational events were held. Identified adult primary and specialty providers increased from 20 to 40. All faculty and trainees working on transition QI could receive MOC credit. Repeat HCTPM are pending. MINT received 63 consults who had a mean age of 21 years (range 17–43), median of 3 specialists (range 1–8), 70% with ID. In the 2 years prior to the MINT consult, referred patients totaled 745 ambulatory visits, 116 ED visits, and 344 hospital days. Time to consult completion ranged from 2 to 30 hours over a course of 2 weeks to 12 months. Patient and provider satisfaction scores are pending.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A tiered and multi-model population-based intervention is both feasible and acceptable to patients, families, and providers in a large free-standing children's hospitals partnering with adult hospital systems. However, transition of medically complex patients is timeconsuming and requires significant infrastructure and personnal investments.

A WHITEBOARD INITIATIVE - IMPROVING PATIENT AND MULTIDISCIPLINARY COMMUNICATION Shobha L. Rao; Roselyn Cristelle I. Mateo; Lauren Priede; Michael Drunasky. Rush University Medical Center, Chicago, IL. (Control ID #2707496)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): During a needs assessment with nursing and patients, it was noted that patients are often frustrated by not knowing the goals and plans for the day.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Enhance patient/family-provider communication of patient-centered treatment plans, hospitalization goals, and discharge needs 2. Standardize the use of the whiteboard for the multidisciplinary team, while still individualizing use based on patient needs to achieve the goals of the initiative. 3. Improve HCAPS scores in the areas of nursing and physician communication

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The unit where the whiteboard initiative is being piloted is a general medicine unit, in which there are many patients with chronic illnesses who are at risk for inadequate management of their illnesses, and thus, risk for worsened health outcomes,

and readmissions. Although, physicians attempt to communicate the plan and goals, this communication is less than ideal. Nursing also finds it difficult to reiterate plans if they are not present during morning rounds, as the rounding structure at our institution is not geographical. A needs assessment was done by surveying patients/families about the use the whiteboard, if they find the information useful, if the plan of the day is communicated, do they have an idea of discharge date based on information on the board, and what specific information they would find helpful. The whiteboards were then changed to reflect these changes. Nursing and a healthcare administration student were instrumental in gathering this information. The presurvey results were analyzed at weekly meetings held with nursing, case management, and physician facilitators. Post surveys were done to evaluate the above after the initiation of the intervention, as well as HCAPS scores were reviewed for the time of the pilot.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1. 30, 60, and 90 day audits and post-intervention surveys of patients were done to assess the goals above. 2. HCAPS scores were reviewed for the pilot's time course.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Final results are still pending. However, based on post surveys and audits of the whiteboard, there has been noted improvement in patients' understanding of the plan for the day. HCAHPS scores for the individual floor were also evaluated, as this one of the goals of the initiative and over 90% improvement for the observed time period was noted in doctor communications. Overall, patient satisfaction and nursing communication also significantly improved.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): We have learnt that a multidisciplinary approach is essential to improving overall communication with patient, as well as amongst the different disciplines. There has been perceived improvement in physician-nursing communication and we will be evaluating this in the future. We present here an innovative and simple approach to improving patient understanding of the plan of care and discharge goals by the utilization of a redesigned whiteboard, based on patient needs, as well improving multidisciplinary communication.

ACHIEVING GOAL BLOOD PRESSURES IN PATIENTS WITH HYPERTENSION IN AN ACADEMIC PRACTICE Penali Noticewala; Carrie Gallagher. Cleveland Clinic, Cleveland, OH. (Control ID #2703974)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Only about 60% of patients with a diagnosis of hypertension in our outpatient academic practice are at goal (defined as a BP < 140/90).

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To increase the number of at-goal hypertensive patients by 5% in 12 months through close follow-up and proactive outreach.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Our hypertension improvement project was one site in an institute wide hypertension initiative to improve the blood pressure of patients in the outpatient internal medicine and family medicine clinics. The interventions at our academic outpatient clinic focused primarily on close follow-up of patients with an elevated blood pressure reading. We believed that patients who were scheduled close follow-up (seen again within 30 days) were more likely to achieve their goal BP. At the start of this project only about 40% of our patients had a follow-up within 30 days of their elevated BP reading. To help improve our 30 day follow-up, a "Nurse BP Visit Order" was developed. Nursing staff and medical assistants could enter this order at the time of a patient's office visit to serve as a reminder to the provider to address a patient's uncontrolled blood pressure and ensure an appropriate follow-up plan is in place. Another intervention implemented at our site to improve the 30 day follow-up was increasing access for patients to be seen. We increased the number of open slots in our nurse visit schedules, allowed use of the walk-in clinic at our site for follow-up BP checks without an appointment, and utilized our clinical pharmacists to help titrate medications. Lastly, proactive outreach was implemented. Our clinic focused primarily on patients who had an elevated blood pressure reading and no upcoming follow-up. Our nurse champion on this project would reach out to these patients either by phone or send them a message via their personalized health record encouraging them to schedule an appointment.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The measures of success we followed included the percentage of patients who had a follow-up within 30 days of an elevated blood pressure reading and the overall percentage of patients with hypertension who were at goal (BP < 140/90).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Our overall blood pressure control in our patients improved from 61.3% in January 2016 to 64.8% in December 2016. We attribute this improvement to the increase in our patients with an elevated BP having a 30 day follow-up (baseline data showed us at 37% in November 2015 and it improved to 52% in October 2016) due to the interventions stated above.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): This hypertension initiative was a multi-disciplinary team effort-including nurses, medical assistants, staff providers, resident providers and pharmacists. It was helpful having bi-weekly automated data provided to follow our improvements and interventions and to further encourage the practice team. Challenges for sustainability include maintaining the energy around the project, dispelling provider preconceptions regarding the need for close follow-up, and aggressive medication management especially in our elderly patients.

ACHIEVING PRODUCTIVITY EXPECTATIONS AMONG GENERAL INTERNAL MEDICINE CLINICIANS AT AN URBAN SAFETY-NET ACADEMIC MEDICAL CENTER Jason M. Worcester; Joanna D'Afflitti; Christine A. Pace; Karen E. Lasser. Boston University School of Medicine, Boston, MA. (Control ID #2705819)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Urban safety-net hospitals have not been traditionally considered settings where productivity expectations can be achieved due to patient, clinician, and health systems factors; achieving productivity expectations is essential in our ever-changing health care system and expanding underserved patient population.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To improve clinician relative value unit (RVU)

productivity in a Section of General Internal Medicine serving an urban safety-net academic medical center.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The intervention targeted 74 physicians and nurse practitioners in a large academic medical group based at Boston Medical Center, the largest safety-net hospital in New England. Providers deliver care in the outpatient, inpatient, or both settings. We implemented several interventions over a five-year period, from 2012–2016. The interventions included 1) clearly outlining productivity expectations; 2) distributing a monthly dashboard with RVU data, expected and actual clinical time, a summary of coding patterns, and clinical patient volume; 3) delivering semi-annual group trainings on maximizing coding; 4) providing audit and feedback of productivity data to underperforming clinicians utilizing a clinician efficiency coach; 5) promoting an overall culture change emphasizing the importance of sustainable productivity and 6) positive and negative incentives including clinical productivity bonuses and salary reductions, respectively.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We measured yearly RVU productivity rates by provider, adjusting for numbers of full time equivalents (FTEs) from 2012–2016. We excluded faculty in their first year of practice, clinicians with extended leaves, and trainees (fellows and residents) from the analysis. We also measured faculty retention/numbers of departing faculty.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Clinical faculty had an 11% increase in RVU productivity over the five-year period. In 2012, clinicians produced 3774 RVUs per FTE. This increased to 3844 in 2013, 3853 in 2014, 4004 in 2015, and 4206 in 2016. Multiple severe blizzards resulted in marked reduction of clinical volume in the winter of 2015. In addition, we implemented a new electronic medical record system (EMR) in 2015. Despite these factors, RVUs continued to increase in 2015. Approximately one-third of faculty received a clinical productivity bonus every year. No faculty had a salary reduction over the five-year period. Rates of departing faculty were 7% in 2012, 11% in 2013, 5% in 2014, 3% in 2015 and 3% in 2016.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): These data suggest that the interventions implemented can achieve sustainable productivity in an urban safety-net environment. Productivity increased despite forces of nature and the introduction of a new EMR. There was a transient increase in faculty attrition that could be partially explained by increased productivity pressure. Future work should examine the relationship between productivity and burnout.

ADAPTING, IMPLEMENTING, AND EVALUTATING A HEALTH SYSTEM INTERVENTION FROM KAISER PERMANENTE IN A LARGE, URBAN SAFETY-NET CLINIC.

joi lee[2, 3]; Kirsten Bibbins-Domingo[1]; Purba Chatterjee[1]; Valy Fontil[1]. [1]University of California San Francisco, San Francisco, CA; [2]University of California San Francisco, Aliso viejo, CA; [3]San Francisco State Univeristy, San Francisco, CA. (Control ID #2705890)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): While an evidence-based treatment implementation intervention has proven sucessful at high-functioning, integrated health systems such as Kaiser Permanente, it is unknown whether these interventions can be adopted in safety-net health systems that may have more limited resources and socio-medically complex popopulations.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): In this project, we used rigorous implementation science approaches such as the PRECEDE-PROCEED framework to adapt an evidence-based hypertension treatment algorithm from Kaiser Permanente, implemented it in a large urban safety-net clinic, evaluate it's effect on improving hypertension control, and understand barriers and facilitators to implementation and dissemination.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We designed a multi-component intervention including an evidence-based treatment algorithm coupled with provider training and education, and standardization of blood pressure measurement at a large primary care safety-net clinic that serve a low-income and racially diverse population in San Francisco.The treatment algorithm was adapted to account for drug formularies and affordability as well as provider preferences.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We used linear regression analyses to assess for post-intervention trends in BP control over 24 months. BP control was defined according to 2014 hypertension guidelines and measured monthly based on the most recent office BP measurement. We conducted theory-informed surveys and focus groups of providers to assess provider recpetiveness and adoption of the intervention, and identify barriers and facilitators to continued implementation and dissemination of the intervention. Survey questions also assessed providers' likelihood to recommend use of the evidence-based treatment algorithm to other providers and health systems.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Implementation of the intervention led to significant improvement in BP control from 65 to 72% ($p < 0.01$) at 12 months post-intervention that was sustained at 24 months. Providers were highly receptive to the evidence-based treatment algorithm with 90% reporting frequent use, and more than 70% of them indicating they would highly recommend use of the algorithm to colleauges and other safety-net health systems. Commonly identified facilitators included a simple treatment intensification algorigthm that mimimized difficult decision-making and improved workflow efficiency. Commonly identified barriers included occasional inability to access the algorithm and challenges in using the algorithm in medically complex patients on multiple medications.They suggested easier availability of the algorithm and integrating the algorithm into a decision support tool in the elctronic health record as a strategies for scalability and dissemination.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Proven hypertension management interventions can be adopted in safety-net clinics. Having a simple, evidence-based treatment algorithms adapted for ease of use based on drug coverage and provider preferences can faciliate their adoption and effectiveness in improving hypertension control in this setting.

ADDRESSING PROVIDER BURNOUT, IMPROVING PROVIDER SATISFACTION, AND INCREASING PATIENT ACCESS THROUGH NURSE PRACTITIONER-PHYSICIAN PRIMARY CARE TEAMS

Joanna D'Afflitti[1]; Jason M. Worcester[2]; Christine A. Pace[2]; Karen E. Lasser[1]. [1]Boston Medical Center, Boston, MA; [2]Boston University School of Medicine, Boston, MA. (Control ID #2706224)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Burnout and dissatisfaction are well-documented challenges facing primary care providers (PCPs); team-based care is one potential strategy for addressing burnout, but few data support this approach.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) Improve PCP satisfaction and decrease burnout by implementing team-based care involving MD-nurse practitioner (NP) partnerships; 2) Increase patient access to care by decreasing time to next appointment with a member of the care team.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We implemented MD-NP care teams ("NP Anchor Model") in a primary care practice based at a large urban safety-net hospital, where patients present with complex social and medical issues and rates of MD burnout are higher than national averages. To address MD burnout, we created MD-NP teams using NPs as team "anchors." We used a ratio of 1 NP FTE:1.5 MD FTE per team, resulting in teams of approximately 1 NP:3MDs. Currently, we have nine NP Anchor teams (nine NPs and 28 MDs). 40% of the NP's time is protected to address between-visit care for patients that members of the team have seen. Such care includes follow-up of abnormal results, chronic disease management by phone, and outreach to patients who have complex care needs. This is the work that MDs have traditionally done between sessions and on evenings/weekends. The remaining time (60%) in the NP's schedule is allotted for clinical sessions, seeing patients on the care team for routine healthcare maintenance, chronic disease management, and urgent care visits.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Primary outcomes are NP and MD satisfaction measured through anonymous surveys sent to clinicians on NP anchor teams, and access to care measured by time to 3rd next available appointment. In the future we will measure NP and MD burnout, comparing NPs and MDs on an NP Anchor team to those not yet on a team.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Prior to the creation of MD-NP care teams, the average time to 3rd next available appointment for MDs was 26.2 days. With the addition of an NP to the care team, the average time to 3rd next available appointment with a member of the care team (MD or NP) decreased to 6.6 days. 50% of NPs and MDs responded to the satisfaction survey, respectively. 72% of MDs reported that the model was very to extremely helpful in expanding patient access, and 50% reported that the model was very to extremely helpful in decreasing burden of work between visits. MDs commented: "This model provides a resource to assist with phone calls and paperwork, and importantly to provide consistent clinical access with a team member." "I love my NP Anchor and have gotten feedback that my patients do, too!" "I'm very pleased with the NP Anchor Model and feel I can trust my NP with my patients' care." All NPs agreed they had adequate time to communicate with MDs in order to perform their job well.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Data suggest that NP Anchor teams are effective in meeting patient needs (timely access to care) and in reducing between-visit workload of MDs, a known driver of physician dissatisfaction and burnout.

ADDRESSING THE BURDEN OF HEPATITIS C INFECTION IN PRIMARY CARE Kristen S. Lee[2]; Alexandra Heinz[1]; Glorimar Ruiz[1]; Leandra Battisti[1]; Alexandria Akoumianakis[1]; Karen E. Lasser[2]. [1]Boston Medical Center, Boston, MA; [2]Boston University School of Medicine, Boston, MA. (Control ID #2707828)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Achieving sustained virologic response (SVR) is possible, yet patients have difficulty accessing treatment services.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To improve access to and retention in hepatitis C (HCV) care by launching an interdisciplinary treatment program in primary care.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The prevalence of HCV infection among patients at Boston Medical Center (BMC) is approximately sixteen percent. We developed a HCV clinic in Adult Primary Care by training general internists to evaluate and treat HCV and creating a medical case management program. Our program includes a team of nine internists; a clinical pharmacist, a pharmacy technician, and a public health social worker. We identify patients via direct referrals from other providers, laboratory notifications, EMR billing codes, community referrals, and patient self-report. The social worker reviews charts of all identified patients and schedules them for consult with a HCV provider. Patients with co-infection (HIV or hepatitis B), chronic kidney disease, and decompensated cirrhosis are referred to specialty clinics. At the initial appointment, the provider completes a clinical evaluation and refers the patient to the social worker for a bio-psycho-social intake and health education. The social worker develops an individualized case management plan and assists the patient to navigate all HCV-related clinic appointments. If medication is prescribed, the pharmacy technician and pharmacist work on treatment approval via prior authorization and medication teaching. The pharmacist follows the patient throughout treatment to assess for adherence and side effects via phone calls and in-person appointments. The HCV provider sees the patient twelve weeks after treatment completion for determination of SVR. Patients ineligible for treatment are counseled on healthy lifestyles and recommend re-evaluation in 1–2 years.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Of the patients referred to the program, we measured the number evaluated, treated, and achieved SVR.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Between March 2015 and December 2016, 522 patients were referred, 257 patients were evaluated; 118 initiated treatment, 92 completed treatment, and 54 patients confirmed SVR. Of the 118 patients who initiated treatment, 36% had advanced fibrosis (F3-F4). All patients received direct-acting antiviral agents. 99% of the patients had public insurance coverage (30% Medicare and 69% Medicaid). Many patients had coexisting psychosocial issues including mental illness, history of incarceration, substance use disorders, and homelessness.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): An interdisciplinary program in Adult Primary Care led to 257 evaluations of patients with HCV and demonstrated the ability to link, engage, and retain patients in HCV care. Training internists with support of case management and pharmacy has the potential to increase the number of patients who access these services. Challenges include ensuring eligible patients complete clinical evaluations and navigating treatment eligibility as insurance coverage changes.

AN ACADEMIC COMMUNITY SCRIBE PROGRAM - PARTNERING FOR A TRIPLE WIN Alyssa Perozich[2]; Patrick Young[2]; Albert Huang[2]; Peter Chin[2]; David Verrier[3]; Maura J. McGuire[1, 2]. [1]Johns Hopkins School of Medicine, Baltimore, MD; [2]Johns Hopkins Community Physicians, Baltimore, MD; [3]Johns Hopkins University, Baltimore, MD. (Control ID #2694515)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): While electronic health records (EHRs) have potential to improve medical care, physicians often struggle to attend to patients when working with EHRs that require them to accommodate the technical demands of the software in addition to the needs of patient care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): (A) Develop a partnership between a school of medicine (SOM), a premedical advising program (PAP), and an ambulatory medical practice (AMP) to implement a scribe program. (B) Determine whether scribes increased joy of practice and other metrics for primary care physicians in the AMP.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Our organization is part of an integrated health system that includes a SOM and AMP with more than 200 primary care physicians and 40 practices. After a previous pilot with commercially-trained scribes demonstrated improved workflow and patient satisfaction, our AMP and PAP collaborated to create an academic-community scribe training program to (1) improve joy of practice, (2) increase physician productivity and (3) enhance patient satisfaction in the AMP. A secondary goal was to develop a meaningful experience for premedical graduates planning to enroll in medical school 12–18 months after their graduation date. Physicians from the AMP were selected to participate in the pilot based on results of an interest survey and practice needs. Scribes were selected from the premedical advisee group after review of an application, resume and interview. A 3-week scribe training course was developed in collaboration with the SOM, and scribes were trained through classroom, simulation and self-paced learning.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Success was measured via quantitative measures including productivity, workflow, quality, and patient satisfaction. Qualitative measures of success included data from focus groups and surveys of scribes and physicians.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 10 physicians indicated interest in working with a scribe and 6 were selected for the pilot. 128 students completed a scribe interest survey, 29 applied to the program, and 6 were selected and trained. Baseline data was collected and metrics were reviewed after 4 months. Qualitative surveys indicated that "joy of practice" increased among all physicians. With scribes, our physicians averaged 307 patients per month in 2016, and 273 patients without scribes in corresponding months of 2015, a 12.9% increase ($p = 0.0064$). Data from workflow, quality, and patient satisfaction metrics showed no significant change in the first 4 months.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our results suggested (1) an academic-community scribe program can be developed with modest effort, and (2) physician productivity and joy of practice increased as a result of the program. We noted substantial interest from premedical students. Based on early success, we are expanding this program.

AN ENCOURAGING STORY - FEASIBILITY AND EARLY RESPONSE TO PATIENTWISDOM FOR INTEGRATING PATIENT AGENDAS AND PREFERENCES INTO CARE Kristina P. Wang; Bradley H. Crotty. Medical College of Wisconsin, Milwaukee, WI. (Control ID #2703747)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Although interventions designed to elicit comprehensive patient agendas and facilitate the clinician-patient partnership have been useful, studies have shown that clinicians and organizations often fall short of delivering truly transformative patient-centered care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): At our academic health system, a secure, web-based tool called PatientWisdom (PW) is being piloted at five primary care sites to improve patient-centered care. In the current feasibility phase, we evaluated patient uptake and participation. We also sought to assess the ability to capture novel (not previously documented) concerns.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): PW asks outpatients to share 'stories' about themselves from a health perspective, with emphasis on their individual values, concerns, and treatment preferences. Prior to appointment, clinic staff will send secure messages introducing PW. Patients can update the agenda for each visit, thus generating a dynamic summary for clinicians. Electronic health record integration is underway.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): To assess participation, we tracked: 1) the rate at which patients responded by creating accounts, and 2) the number of data entries ('stories') that patients provided. We undertook a preliminary analysis, initially focusing on anxiety, to identify if concerns that patients were voicing electronically were addressed in the electronic health record (EHR).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): From Aug-Nov 2016, practices sent 3,050 secure messages. Patients opened 1,277 (42%) messages, and 389 patients created accounts. The response rate was estimated at 13% overall (30% if the message was opened). Participating patients submitted a total of 2,883 'stories' about their backgrounds, preferences, and needs. Twenty-three patients shared stories with their care team that included concerns about anxiety. Most had diagnosed

anxiety disorders; two patients (9%), however, voiced concern about anxiety without the record identifying or addressing the problem. For the 21 patients with a prior diagnosis, anxiety was noted in the current problem list or past medical history only 57% of the time.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The response to this feasibility trial of PatientWisdom is encouraging for a new technology not yet fully integrated into culture and routine use. Several barriers in the current state, including no EHR integration at present, limit the ability to automatically remind and encourage patients and to seamlessly share with clinicians. Nevertheless, over 10% of patients enrolled in the portal with upcoming appointments created new accounts; once creating accounts, patients were keen on sharing data with clinicians. Efforts to make this process as seamless as possible, including EHR and patient portal integration, should boost participation. The tool already appears able to identify patient-concerns that are not in the medical chart, and to provide a more patient-centric source of data to clinicians.

AN INITIATIVE TO PROMOTE ANTIBIOTIC CITIZENSHIP ON AN INTERNAL MEDICINE TEACHING SERVICE Elizabeth Park[3]; Parimal A. Patel[4]; Renuka Gupta[2]; Jennifer I. Lee[1]; Stephanie J. Tang[5]. [1]NYP/WC, New York, NY; [2]NYPH- Weill Cornell Medical Center, NY, NY; [3]New York Presbyterian Hospital, New York, NY; [4]NewYork-Presbyterian, New York, NY; [5]New York Presbyterian Weill Cornell Internal Medicine, New York, NY. (Control ID #2700862)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Antibiotic overuse is a major driver of resistance, therefore ingraining the principles of antibiotic stewardship into physicians in training is essential.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Through our interventions, our goal is to reduce unnecessary utilization of selected broad spectrum agents by 15 and ensure that greater than 90% of patients receive antibiotic treatments consistent with institutional guidelines. 2. Through our interventions, our goal is to improve trainee confidence regarding antibiotic management.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): This pilot quality improvement initiative was implemented on three general medicine teaching services. All teams received a pocketcard of institutional antibiotic guidelines and were instructed to utilize a newly developed standardized daily documentation template including antibiotic indication, relevant culture results, length of therapy, and plan for de-escalation. One team also met twice a week with a member of the hospital Antibiotic Stewardship Program to discuss all patients receiving antibiotics. On a second team, a PharmD integrated antibiotic stewardship into daily attending rounds. Trainees were surveyed before and after their rotations to assess the impact of these interventions on their confidence in antibiotic management.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Our primary outcome measures included: 1. Antimicrobial utilization rates (defined as days of therapy per 1000 patient days), as compared to historic institutional data 2. Rate of adherence to hospital treatment guidelines for the common disease syndromes of urinary tract infections and pneumonia, as compared to historic institutional data 3. Survey before and after intervention described, focusing on confidence in antimicrobial management and practice

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Preliminary survey results indicate a general trend towards improved confidence. Survey scale ranged from 1 = Strongly agree to 4 = Never or 1 = Always to 4 = Never. Confidence in ability to choose an appropriate empiric antibiotic improved from mean 2.05 prior to intervention, to mean 1.82 post-intervention. Similar trends were observed in choosing dosing and interval [2.48 to 2.17], duration of therapy [2.35 to 2.30], and reassessment of antimicrobial therapy [2.10 to 1.53]. Participants' awareness of institutional treatment guidelines increased [76% to 97%] as well as utilization of the guidelines [2.28 to 2.14]. Participants also increasingly felt they had received adequate training on antimicrobial prescribing [2.54 to 2.12]. Moreover, 100% of the participants felt that stewardship rounds improved their antibiotic decision-making.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our preliminary data suggest that participation in organized discussions regarding antibiotic practices enhanced daily documentation. Moreover, increased exposure to antibiotic guidelines enhances trainee confidence in antibiotic management. Our project highlights the importance of enlisting trainees as active collaborators in building a culture of antibiotic stewardship, a practice that can then be fostered throughout their careers.

AN INNOVATION TO IMPROVE SAFE OPIOID PRESCRIBING THROUGH THE UTILIZATION OF UNIVERSAL PRECAUTIONS AS A QUALITY METRIC FOR PRIMARY CARE. Donald Medd[1]; Rebecca Hemphill[2]; Kristen Silvia[3]; Gregg Raymond[4]; Christina Holt[5]. [1]Maine Medical Partners, Westbrook, ME; [2]Maine Medical Partners, Falmouth, ME; [3]Maine Medical Partners, Scarborough, ME; [4]Maine Medical Center, Portland, ME; [5]Maine Medical Partners, Portland, ME. (Control ID #2701042)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Variability among prescribing practices of narcotics for chronic pain existed across across the spectrum of primary care within our organization.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Our safe opioid prescribing quality metric aimed to decrease physician variability of opiate prescribing and improve the safety of our patients receiving opiates for chronic pain.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Maine Medical Partners (MMP) is a large multi-specialty group located in and around greater Portland, Maine; a semi-urban area with a population of roughly 250,000. MMP serves a patient population of 78,912. There are 107 physicians, and residents in training, practicing the primary care specialties of general internal medicine, medicine-pediatrics and family practice leading to a need for streamlined, evidence-based practice work flows. A guideline created in 2013 by a workgroup of MMP primary care physicians, established standardized EMR documentation for controlled substance agreements, recommended a yearly check of the state's PMP for each patient, and recommended yearly random urine drug screening. We proposed these universal precautions for all of our

patients on opiates for 90 consecutive days and proposed the precautions as a quality metric for our primary care practices with 3% of physician quality compensation tied to achieving a 10% adoption.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): A data set defining individual physician patient populations meeting the 90 consecutive day opiate prescription requirement was created and placed on a group quality metric website. In 2015, physician education, data collection and MA refill workflows were piloted in one Internal Medicine practice to confirm tracking and feasibility of the metric. Our preliminary goal meant to achieve fulfillment of the three elements of the universal precautions for the narcotic prescribing bundle in 10% of the patients on opiate pain medications. A monthly retrospective chart review for each of the participating practices was performed and data returned to the individual providers and practices to provide feedback to practice managers, prescribers and the clinical teams.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): At the time of initiation of the project (August 2015), 1475 patients were identified as meeting the definition of chronic opiate recipients. 7% of this population met the universal precautions for narcotic prescribing quality metric. One year later (August 2016,) the number of patients receiving opiates chronically was reduced to 1133 with over half (53%) meeting the universal precautions for narcotic prescribing quality metric.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Clinical protocols for universal precautions for opiate prescribing can achieve high rates of adoption in primary care practices as part of a clinical physician quality metric. In addition, universal precautions may have the effect of reducing the number of patients receiving opiates for chronic pain.

AN INNOVATIVE TEAM-BASED CHRONIC OPIOID MANAGEMENT INITIATIVE FOR PATIENT SAFETY Julie Tishler; Deborah Blazey-Martin; Kristin Huang; Daniel Chandler; Joseph gillis; Julie Gilman. Tufts Medical Center, Newton, MA. (Control ID #2710530)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): As deaths from prescription opioids have increased to 15,000 in the U.S. in 2015,[1] it has become imperative that primary care practices restructure chronic opioid management using population health strategies for patient safety. [1] Centers for Disease Control and Prevention. Prescription Opioid Overdose Data, 2016. https://www.cdc.gov/drugoverdose/data/overdose.html. Accessed 26 Dec 2016.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1.Identify key components of a chronic opioid management program. 2.Describe team based algorithms that support clinicians in prescribing opioids safely. 3.Recommend monitoring methods to encourage improvement in population health outcomes.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We developed outpatient practice guidelines/algorithms for the initiation and monitoring of chronic opioid prescribing, including the use of standardized screening tools to evaluate the risk for abuse. These guidelines included a team-based approach in which high-risk patients receive social work referrals and physician assistants collaborate with primary care physicians. To facilitate these interventions and streamline care, we designed a component in our electronic health record that automates and records required monitoring activities and serves as a repository for opiate management resources.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We will measure qualitatively residents' comfort with managing chronic opiates in their patients before and after program initiation. In addition, we will quantitatively track adherence with our standard guidelines for chronic opiate management including yearly contracts, urine toxicology screens and checking the prescription monitoring program.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Internal medicine residents felt more comfortable managing chronic opiates and benzodiazepines in their patients after program implementation, with an average score on a 5-point Likert scale increasing from 2.77 ($n = 44$) before to 3.06 after ($n = 32$). The percentage of patients on chronic opiates who had signed a controlled substances contract in the past year increased from 52% at baseline ($n = 551$) to 70% a year after program implementation ($n = 469$). Similarly, the percentage of patients with a urine drug screen rose from 63% to 92%, while patients who had been checked using the state prescription monitoring program checked in the past year rose from 21% to 98%.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A team-based chronic opioid management initiative was successful in increasing provider comfort with prescribing and monitoring chronic opioids. This in turn contributed to patient safety by more accurate assessment of risk, increased compliance with monitoring parameters, and improved counseling of patients. This type of comprehensive program can be replicated in other primary care settings and is ever more needed as we respond to our nation's opioid epidemic.

AN INTERDISCIPLINARY CARE COORDINATION INTERVENTION TO DECREASE PNEUMONIA READMISSION RATES IN ADULT PATIENTS IN AN URBAN ACADEMIC HOSPITAL SYSTEM John Stoeckle; Albert G. Crawford; Stephen Sigworth; Therese Narzikul; Richard Jacoby; Alexis Silverio. Thomas Jefferson University, Philadelphia, PA. (Control ID #2705994)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Readmission rates for pneumonia are a marker of quality of care, and continuous improvement is essential to avoid penalties by the Centers for Medicare and Medicaid Services Hospital Readmission Reduction Program.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To decrease readmission rates through a structured, interdisciplinary care coordination intervention in adult patients admitted for pneumonia.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The intervention was developed at an urban, academic, hospital system with approximately 43,000 admissions annually by a multidisciplinary team with stakeholder

involvement over the past six months. Stakeholders included hospitalist and specialty groups, nursing, case management, outpatient care coordination, and hospital administration. After a review of the literature, several evidence-based interventions were selected. Over a 12-month period, an interdisciplinary team composed of a care coordinator, pharmacist, and respiratory therapist will identify all newly admitted patients with pneumonia. Each patient will be risk-stratified using a validated LACE+ risk tool and will receive an inpatient visit from the team, including a comprehensive needs assessment, medication education, and self-management education. Comprehensive discharge planning will be performed, including ensuring the scheduling of appointments and physically providing medications prior to discharge. High risk patients will be enrolled in a novel outpatient care coordination program, where they will be assigned to a longitudinal care coordinator who will develop and update an individualized care plan over time in collaboration with the patient's providers. The highest risk patients will receive a home visit within 48 hours of discharge.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Pre- and post-intervention readmission rates will be compared; ED utilization and cost of care will additionally be compared. Specific effects of discrete care coordination actions on outcomes will be examined.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The intervention is scheduled to begin in February 2017 and will run for an estimated 8–12 months; preliminary data will be available.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): As the bar for readmission reduction is continually raised, we will determine whether an interdisciplinary team implementing evidence-based interventions affects readmission rates, ED utilization, and the cost of care for patients with pneumonia.

ASSESSMENT OF CAREGIVER BURDEN WITHIN AN INTEGRATED HOME BASED PRIMARY CARE PRACTICE Elisabeth L. Hill; Bruce Kinosian; Mary Ann Forciea; Olga Achildi. University of Pennsylvania, Philadelphia, PA. (Control ID #2702357)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Is there significant caregiver burden despite formal supports?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Determine if there is significant caregiver burden despite home and community based services. Determine if there are indicators associated with an increase in burden. Identify interventions which may be beneficial within this caregiver population.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Setting: Penn Medicine Geriatric Housecall practice, integrated with HCBS services. Providers identified caregivers appropriate for survey, which was administered during patient visits or by phone. The survey used demographic questions, combined with the validated Caregiver Self-Assessment Questionnaire (CSAQ). Three different dimensions of burden were assessed: the level of stress and burden experienced by the caregivers by the CSAQ, whether or not caregivers reported missing personal medical appointments due to caregiving responsibilities, and whether the caregiver perceived any financial strain associated with caregiving. The CSAQ has 4 different measures for significant burden, which were treated both as a single categorical threshold (any measure) and as an interval measure (number of measures positive). Demographic, diagnostic, and insurance status was determined by chart review. Caregivers were additionally asked for their preferred change to reduce caregiving stress.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Number of survey responses, prevalence of perceived burden.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Of 214 patients, 122 were deemed to have caregivers appropriate for the project, of whom 58 completed the survey (47%). The majority of caregivers are middle-aged (between 50 and 64 years old) daughters of the patients. More than half (53%) of caregivers report devoting more than 8 hours/day to their patient's care. 31% of all caregivers are receiving formal community supports. Of caregivers surveyed, 60% scored positive on the CSAQ, 43% reported missing medical appointments, and 47% reported financial strain. There was no difference in burden between those with and without formal supports. Unpaid caregivers were more likely to be burdened on the CSAQ than paid caregivers (71% vs. 40%, $p = 0.02$). There was no statistical difference seen between caregivers of patients with dementia vs. without, although caregivers for patients without dementia were more likely to be positive on 3–4 measures, while caregivers for dementia patients were more likely to be positive on 1 measure. The availability of community supports did not indicate lower levels of burden. Caregivers' responses to a change to relieve stress were in four main themes: more time, more money, more family support, or more information. The project identified some 'quick wins' to improve stress and burden around providing more information for caregivers of dementia patients.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Caregiver burden for home care geriatric patients is multidimensional (stress/finances/personal health) and prevalent. Regular assessment is important, as providing formal supports can be inadequate. Assessment may yield some "quick wins" and help guide initiatives to relieve burden.

BREAKING THE CYCLE: A SUCCESSFUL INTERVENTION FOR HIGH UTILIZERS ON A GENERAL MEDICINE SERVICE Kirstin Knox; Jessica Schneider; Vicmar Gatmaitan; Todd Hecht; Neha Patel; Jennifer S. Myers. Hospital of the University of Pennsylvania, Philadelphia, PA. (Control ID #2703871)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Patients recurrently admitted to the hospital frequently experience fragmentation of care and poor health outcomes, with discontinuity between hospital admissions resulting in unnecessary testing, ineffective or inconsistent treatment plans, patient/provider frustration, and inability to address the underlying medical and psychosocial issues that drive repeat hospitalization.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): For patients with the highest inpatient utilization on our general medicine service, our objectives were to 1) increase continuity and care coordination, 2) identify and address the underlying drivers of hospital utilization, and 3) reduce unnecessary health care utilization.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We designed and implemented a multidisciplinary intervention targeting the highest utilizers on our inpatient general medicine service. For each patient enrolled in the program, we assign an inpatient continuity team, including a hospitalist physician and nurse, to perform an in-depth review of the patient's history and healthcare utilization patterns, solicit input from outpatient providers, and engage with the patient and his/her caregivers. The patient case is then presented to a multidisciplinary high-utilizer care committee (MHUCC), including physicians (hospitalist, emergency medicine, and psychiatry), nurses, and social workers, as well as representatives from a community health worker program, home care, and risk management. Together, the continuity team and MHUCC develop a care plan for the patient that consists of 1) a succinct medical and social history, 2) guidance for future ED, inpatient, and outpatient providers, and 3) a detailed intervention plan targeting the underlying medical and psychosocial drivers of healthcare utilization. The continuity team works with the patient, outpatient providers, and subsequent admitting teams to implement these interventions and to streamline admissions; the care plan is made available to all providers via the EMR and is regularly updated by the continuity team.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The program is evaluated using inpatient utilization metrics including overall number of hospital admissions, 30-day readmissions, total hospital days, average length of stay (LOS), and associated hospital costs.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Seventeen patients have been enrolled to date. In a pre/post analysis comparing the six months pre and post intervention, total admissions, 30-day readmissions, and total hospital days were reduced by 46%, 62 and 50%, respectively, with no change in average LOS ($n = 12$); total direct costs were reduced from $2,524,000 to $1,101,000 ($n = 9$). Providers describe improved consistency, decreased frustration, and in some cases, facilitation of previously delayed diagnostic or therapeutic procedures.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A multidisciplinary and highly individualized approach is essential to developing successful interventions for patients with high hospital utilization. The inclusion of a consistent nurse to support the program and provide extensive care coordination both during and between admissions is a key to success.

BUILDING PCMH MORALE AND TEAMWORK IN THE SAFETY NET DURING EMR ADOPTION

Karen J. Kim; Heather B. Schickedanz. Olive View-UCLA Medical Center, Sylmar, CA. (Control ID #2704326)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): How does a safety net patient-centered medical home (PCMH) redesign workflows to successfully adapt to the rollout of a new electronic medical record (EMR)?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Apply human-centered design tools to redesign PCMH workflows. 2. Optimize and strengthen team function in the context of new EMR adoption. 3. Improve the patient and PCMH team member experience through workflow redesign.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We implemented a collaborative, team-based redesign of PCMH workflows in a large urban clinic set in an academic safety net hospital. At baseline there was low morale with nursing staff and providers working in silos. We transformed monthly staff meetings into human-centered design sessions, engaging all team members to brainstorm and engineer a better way of working together. We built empathy and trust through "pairing and sharing" exercises and reverse role plays, used themed ideas boards to spark discussion, and "shout outs" to recognize and appreciate team members. Together we developed a set of "Golden Rules" to promote healthy team interactions. After six months of team-building, we collectively created a Values Statement to serve as the foundation for our daily work.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We evaluated the effectiveness of PCMH redesign using an anonymous survey offered online to all clinic providers and staff. The survey was administered in December, 2015 at the start of the PCMH workflow redesign process (shortly after our November 2015 EMR rollout), and again one year later in December, 2016.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Pre- and post-survey results reflected positive change in PCMH team function and morale over a one-year period of redesign. Nearly all providers and staff (95%) reported that the PCMH team works together "quite effectively" or "extremely effectively," compared to 46% before the redesign. The majority (58%) of team members felt clinic workflows and work environment were improving compared to only 31% the year prior. Additionally, 73% of current PCMH team members reported they are satisfied working in our clinic (31% "strongly agree," 42% "agree").

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our PCMH team used the challenge of EMR adoption as an opportunity to redesign existing inefficient clinic workflows. Applying human-centered design tools, we innovated new ways of working together which helped improve team communication and build morale. Our successful team-building efforts have helped promote primary care transformation and organizational change at our safety net institution. Our approach to PCMH redesign can be used by other organizations seeking to creatively approach operational challenges, improve team function, and promote team member engagement and resilience.

CARE FOR PATIENTS WITH HIGH NEEDS AND HIGH COSTS: THE ROLE OF HOME VISITS

Brian C. Hilgeman; Julie L. Mitchell; Theodore MacKinney. Medical College of Wisconsin, Milwaukee, WI. (Control ID #2700596)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Clinics serving patients with high needs and high costs (HNHC) are becoming more common, but the unique role and best practices of home visiting in these programs are not clear.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Implement a structured home visiting program within a HNHC clinic at an academic health center. 2. Measure the effectiveness of a home visit program in improving patient care and lowering ED visits.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The MCW Enhanced Care Program is a new clinic serving HNHC patients within our internal Medicine clinic. We provide multi-disciplinary, coordinated care (primary care, social work, case management, and behavioral health) for HNHC patients defined by a high risk score. Elements in our risk score include chronic medical and mental health conditions, ED use, admissions, Medicaid enrollment, and age. We currently serve 27 patients and plan to serve 200. Our patients are mostly African American (89%) and female (69%), have an average age of 54 years (range 20–89), and averaged 5 ED visits and 4 hospitalizations over the past year. After at least one clinic appointment, we completed home visits as needed, based on the physician's clinical judgment.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We assessed whether or not each home visit allowed for the collection of information that would not otherwise be collected in an office visit. We categorized the information into social needs, physical environment, self-management barriers, and medication reconciliation and adherence topics. We also recorded whether or not the visit prevented an ED visit and whether or not the patient could have made a timely clinic visit instead of the home visit. Qualitative data were tallied based on the independent judgment of two internists.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We completed 12 home visits on 33% of our enrolled patients. Home visits newly identified medication errors (58%), physical environment concerns (92%), self-management barriers (75%), and social needs (67%). Social needs included personal care assistance, insurance, and transportation issues. 50% of the visits occurred when the patients could not visit the clinic, due either to a physical disability or an acute health issue. 25% of the visits prevented an ED visit; all of these were acute visits.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1. Home visiting in a HNHC clinic serves an important role and can identify needs that would otherwise not be discovered in the office. 2. Scheduled home visits should be multi-disciplinary (involving social work and medical) and structured to investigate specific needs that may not be apparent in an office visit including medications, physical environment, self-management needs, and social needs. 3. Home visits can help the care management team and patient prioritize future care directions. 4. Acute visits serve a need to prevent emergency room visits but require considerable flexibility on behalf of the providers and clinic. 5. Home visits provide a unique benefit of connecting and assessing competence of home based caregivers and developing trust with our patients.

CLEVELAND CLINIC'S INTERNAL MEDICINE & GERIATRICS QUALITY IMPROVEMENT TRAINING PROGRAM Nirav Vakharia[1,2]; Andrea L. Sikon[2]. [1]Cleveland Clinic, Shaker Hts, OH; [2]Cleveland Clinic, Cleveland, OH. (Control ID #2706911)

STATEMENT OF OF PROBLEM OR QUESTION (**ONE SENTENCE**): The Cleveland Clinic Department of Internal Medicine & Geriatrics is working to engage every caregiver to drive improvements every day. We have found that while our caregivers have great desire to improve the quality of care, frequently they lack key quality improvement (QI) skills and are thus limited in their ability to improve care delivery processes.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Address the *capability* gap for QI in a sustainable manner by combining learning with application to a real clinical problem 2. Address the *capacity* gap for quality improvement by promoting team work and providing a structured curriculum

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Our QI Training Program effectively integrated the academic medicine mission areas of education, scholarship, and clinical care by linking experiential learning and application to a real clinical problem with a resultant project poster. In this program interdisciplinary team members applied quality improvement skills within our Department - a busy primary care practice at the Main Campus, an urban health center in East Cleveland & a consultative Geriatrics Center. During the 12 weekly classroom sessions delivered by a department physician and Continuous Improvement expert, activities, group work and peer coaching were used to illustrate key concepts and tools. Every week teams were assigned homework requiring them to apply the concepts learned in class to their projects with help from coaches. At the end of the 12-week program the teams presented their work to the sponsors and organizational leaders. Program outcomes included not only learning but also improvements in clinical issues such as cognitive screening in the elderly, greater efficiency in communication of test results, greater efficiency in referral scheduling, etc. The program was run five times between January 2013 and December 2015, and successful teams were encouraged to submit their work nationally for poster presentation.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Learner: Self-rated comfort with QI skills (pre- and post-rating), QI Knowledge Assessment Test, and overall rating of the program. Projects: % of teams/projects that reported out at the end of the program, % that met goal by the end, % sustained at 1 year

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Learner: 62 graduates, 70% completed the pre- and post-course assessments, showing: − 31% improvement in self-rated comfort with QI - 35% improvement in QIKAT scores, − 9.0/10 rating for the program. Projects: − All 18 projects that started reported out at the end of the program - 14 of 18 met their project goal - 12 were successfully sustained at 1 year

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Interdisciplinary approach increases likelihood of success and bypasses traditional hierarchies. Formally orienting leaders to effective project sponsorship promotes team success. A formal report at the end keeps team attention throughout the program. Project scoping and selection critical to get some results by the end. Project coaching: defining and standardizing the coaching approach is an ongoing effort.

CO-MANAGEMENT OF DIABETICS BY GENERAL INTERNISTS WORKING WITH BEHAVIORAL HEALTH COUNSELORS IMPROVES DIABETIC CARE IN A SAFETY NET CLINIC Carolyn F. Pedley[3]; Melanie Martin[2]; Feben Girma[1]; Karen Maynard[2]; Robert Jones[2]; Billie Cole[2]. [1]Wake Forest Baptist Medical Center, Winston-Salem, NC; [2]Wake Forest University, Greensboro, NC; [3]Wake Forest, Winston-Salem, NC. (Control ID #2707021)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Diabetes in adults with poor financial resources has a high incidence of depression which impedes the management of this complex disorder

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Shared clinic visits with behavioral health counselors and general internists work to address the underlying depression and manage the diabetes to improve medication adherence, control of diabetes and improvement of depression scores in these patients.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Two behavioral health counselors (BHC) were employed in a general medicine practice which serves as a safety net clinic for those with poor economic resources. A PHQ9 test was performed at the time of intake to define if the patient was suffering from significant depression. If the score was greater than 5 one of the counselors was notified and brought into the visit with the patient. Measures of diabetic control were taken before the intervention by the BHC in patients identified as being diabetic. These patients were tracked and seen in followup by the BHC as deemed necessary. PHQ9 testing was performed at each subsequent visit to track the level of depression and the HgbA1C was tested at regular intervals. Measures of medication adherence were obtained by patient report and refill intervals.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1. Improvements in the PHQ9 scores 2. Improvements in HgbA1C levels 3. Improved medication adherence

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The co-management of adult diabetics in a safety net clinic by behavioral health counselors working with internists significantly improved the PHQ9 scores, HgbA1C levels and medication adherence.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Co-management of diabetics with significant depression by behavioral health counselors and general internists has a greater chance of success in improving parameters for both these conditions. It is important to recognize that underlying mental illness adversely impacts chronic diseases such as diabetes and needs to be directly addressed.

CREATING AN EFFECTIVE SYSTEM TO IDENTIFY AND TREAT ANXIETY IN THE CLINIC Kevin Z. Kinlaw[1]; Diane Dolan-Soto[1]; Sharon Eshet[2]; Amy Weil[1]. [1]University of North Carolina, Chapel Hill NC, NC; [2]UNC Chapel Hill School of Medicine, Chapel Hill, NC. (Control ID #2705765)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Does use of the GAD-7 questionnaire in conjunction with an evidence-based treatment algorithm increase identification and successful treatment of anxiety?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Identify patients with anxiety and improve the treatment they receive. Assess adherence to the algorithm and identify areas for improvement. Reduce long-term use of benzodiazepines for anxiety management.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The program was conducted in an academic, general internal medicine clinic that sees 12,000 complex patients from across North Carolina annually. An evidence-based treatment algorithm and suggested medication list were created and vetted with providers via departmental meetings and disseminated to providers via two case-based resident education sessions. Copies of the GAD-7, the treatment algorithm and the medication list were available online and placed in the physician workrooms. The GAD-7 questionnaire was used as an assessment tool. We performed several iterative PDSA chart reviews of selected patients who scored >9 on the GAD-7 (at least moderate anxiety).

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): To assess adherence to the algorithm, we reviewed charts to determine if newly diagnosed patients, severe anxiety patients (GAD-7 > 14) or patients started on a new medication were asked to follow-up in 4–6 weeks. We considered an improvement in anxiety treatment to be a decrease of at least 5 points on the GAD-7. We also analyzed medication regimens, referrals to counseling, and referrals to psychiatry. To analyze benzodiazepine use, we reviewed patients receiving benzodiazepines for anxiety to see if they were tapered, prescribed only for breakthrough anxiety or prescribed chronically.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The prevalence of anxiety in our clinic population over a 3 month period was approximately 10%–at the low end of national prevalence. In a random subset of 55 patients followed over 11 months, we excluded 10 who had anxiety medications managed by an outside provider. 25 of the remaining 45 patients had more than 1 follow-up appointment. Of those 25 patients, 15 had a decrease of greater than 5 points in their GAD-7. 10/45 patients received benzodiazepines at some point over the 11 months. 4 were weaned off, 3 were only temporary, and for 3 patients they were chronically prescribed. 37/45 had appropriate follow-up time horizons requested. Patients who saw the same provider twice in a row within 3 months were 29% more likely to have anxiety addressed at the follow-up appointment and 53% more likely to have a GAD-7 score documented.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Through the use of an evidence-based algorithm and medication guide in conjunction with educational sessions for staff, patients with anxiety can be identified and treated. Particularly for patients that have multiple follow-up visits, there can be significant improvement in their anxiety.

CROWDSOURCING OPPORTUNITIES TO IMPLEMENT NUDGES TO IMPROVE THE VALUE OF CARE DELIVERED TO PATIENTS Gregory Kurtzman[2]; Rebecca Kim[2]; Mitesh Patel[1]. [1]University of Pennsylvania, New York, NY; [2]University of Pennsylvania, Philadelphia, PA. (Control ID #2698738)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): How can we engage members of a health system community to generate actionable ideas for behavioral interventions to improve the value of care delivered to patients?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): In this study, we evaluated submissions from a health system-wide innovation tournament launched by the Penn Medicine Nudge Unit to identify opportunities to use nudges, changes in the way choices are presented or framed that can influence medical decision-making, to improve the value of care delivered to patients. Our objective was to identify themes and types of nudges proposed in the submissions.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): During three weeks in May 2016, members of the University of Pennsylvania Health System were invited by email to participate in an innovation tournament to generate ideas to use nudges to improve care delivery or patient outcomes. Individuals could submit a problem, solution, or both. A description of nudge theory and examples of previously implemented nudges were provided. To encourage participation, a drawing for an Apple Watch was offered to respondents, and finalists could select from prizes valued near $100.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Respondents identified their submission as reducing low-value care, increasing high-value care, improving care coordination, or other. Submissions were analyzed using grounded theory by two reviewers, which allows themes to arise from the responses themselves, and kappa scores were calculated for inter-rater reliability. Proposed solutions were coded by nudge method using the Nuffield Intervention Ladder.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): There were 225 submissions identified as improving care coordination (46%), increasing high-value care (29%), reducing low-value care (12%), and other opportunities (13%). The most common themes identified from grounded theory are as follows: improving employee or patient satisfaction (32.9%), increasing usage of technology (29.3%), and optimizing transitions of care (28.4%). The mean of the kappa scores was 0.65 (SD: 0.11; range 0.48 - 0.78). There were 204 individuals who included a potential solution with their submission, and 77% of them stated interest in helping with implementation. The following is the distribution of potential solutions by nudge method: provide information (36%), enable choice (27%), change defaults (23%), provide incentives (7%), provide disincentives (1%), restrict choice (2%), and eliminate choice (4%).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our findings demonstrate the potential to use innovations tournaments to identify opportunities to implement interventions to improve health care value. A diverse array of areas to address were identified by members of the health system. While more than 90% of submissions included potential solutions, many of them were lower on the intervention ladder, such as providing reminders or alerts. Nudges higher on the ladder could be more effective and cause less disruption to workflow. This finding indicates that while the tournament could be used to identify ideas, additional guidance from behavioral scientists may be needed for appropriate intervention design.

DEMONSTRATING GRIT FOR IMPLEMENTING HEALTH COACHING IN A LOW RESOURCE ACADEMIC PRIMARY CARE CENTER THROUGH THE USE OF MEDICAL STUDENT VOLUNTEERS: MEDICAL STUDENT EXPERIENCES PROVIDING TELEPHONE HEALTH COACHING FOR WEIGHT LOSS PROVIDES EDUCATIONAL BENEFIT WHILE SUPPORTING PATIENT SELF-MANAGEMENT SKILLS Stacie Schmidt. Emory University, Atlanta, GA. (Control ID #2671706)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): In an academic primary care setting caring for low-income patients, we wanted to determine whether health coaching for weight loss by medical students could (1) be achieved by interested medical students and (2) be considered a valuable educational experience.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Develop and implement a tool for medical students to conduct telephone health coaching for goal setting and weight loss with low-income, obese patients, in a manner that offloads primary care physicians. 2. Assess medical student experiences and perceptions in performing telephone health coaching on a voluntary basis.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The Grady Primary Care Center (PCC) is an urban outpatient clinic located in Atlanta, Georgia with ~70,000 visits annually. Most patients have low-literacy and are uninsured. Approximately 60% are obese, and many have multiple related comorbidities. Due to time constraints and lack of provider knowledge, little time is spent empowering patients to make healthy choices related to diet and exercise. Thus, healthy behaviors are taught through weekly classes focused on helping patients set individual goals related to making healthy choices around diet and exercise. Given that many of our patients only attend 1–3 classes, we sought to implement telephone outreach to assess progress towards goals, using online forms cotaining open-ended questions and free text answers.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Students provided a one-page written reflection upon completion of their experience, outlining key themes they identified.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Through written and verbal feedback, medical students identified key themes regarding their experience. They identified that telephone health coaching seemed to work well when implemented for patients who had vested interest in weight loss, demonstrated by having attended at least one Healthy Living Group Class at our Primary Care Center. Students also noted that calling the same cohort of patients each week to follow-up on goals provided continuity and rapport for both student and patient. Students found that taking notes on discussion points, even if unrelated to the patient's dietary or exercise goal, also established rapport. Also, keeping the conversation on track and limiting the calls to 5–10 min made the conversation seem less burdensome to patients. All students who participated in the initiative voiced that the experience provided them the opportunity to hone their communication skills with patients, and gave them a greater appreciation for difficulties faced by patients with chronic diseases.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR

COMMUNITY?): In an under-resourced urban outpatient clinic serving low-income, low-literacy patients, telephone health coaching as a volunteer experience by medical students enhances their appreciation of the patient experience while allowing opportunities to practice patient-centered doctor communication as it relates to setting goals for weight loss.

DEPLOYING A REAL-TIME PATIENT FEEDBACK TOOL FOR PRIMARY CARE UNDER POPULATION HEALTH MANAGEMENT

Stella Safo; Natalie Privett; Michael Escosia; Anna Stapleton; Bruno Silva. Mount Sinai Health System, New York, NY. (Control ID #2705004)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): How can patient feedback be incorporated into practice operations in real-time?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. To show an urban primary care practice that patient feedback can be obtained and reported to staff in real-time. 2. To learn the best mechanism for staff engagement around incorporating patient feedback into clinical and operatoinal workflows.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Population health management requires health systems to approach patient care in a novel manner. Patient feedback is fundamental to improving patient experience, however feedback is often provided to practices a few weeks or months from the time of collection. To address this gap, the multidisciplinary Health System Design (HSD) team at Mount Sinai Health System team used the core competencies of interaction design and process engineering as well as clinician insights to create a "Real-Time Patient Feedback Tool" that will impact practice operations. At a large, urban academic medical center in New York City, the HSD team conducted field observations of four outpatient primary care practices to define the current state of patient feedback, identify user needs of both patients and practice staff related to feedback, and examine current pain points in collecting and utilizing feedback. Insights derived from these observations of patient and staff informed the development of a "Real-Time Patient Feedback Tool." The Feedback Tool was then rapidly prototyped and deployed for testing at a busy, urban primary care practice. Principles of process engineering were used to develop procedures for engaging patients, collecting feedback, and disseminating feedback to the staff in a timely manner.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The Feedback Tool is being developed into an application for easy dissemination. Once completed, it will be piloted at an 18,000-member practice and a pre and post test will be administered to evaluate impact. In addition, qualitative interviews will be administered to staff and patients.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Initial field observation and ethnographic interviews revealed five priorities for the Feedback Tool: engaging patients to provide feedback; relaying feedback to practice leadership in real time; making feedback available to all p staff; generating feedback on all points of patient care; and empowering practice leadership to take action in response to feedback. The Tool was designed to meet these five criteria and was developed as a six-question survey completed at check-out. Results were immediately available to the practice administrator, who could then convey these to other staff. Now that the Tool is developed, current iterations will examine how its real-time feature allows for patient insights to be proactively collected and incorporated into short- and long-term strategic and operational decisions of practice leadership.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1. Principles of interaction design and process engineering were effective to produce a tool providing real-time feedback to practice staff. 2. Future work is needed to measure the impact of real-time feedback on staff workflows.

DESIGNING DASHBOARDS TO ENHANCE RESIDENT LEARNING AND PRACTICE IN POPULATION HEALTH

Gail Berkenblit. Johns Hopkins, Baltimore, MD. (Control ID #2708312)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): The ACGME requires "evaluation of performance data for each resident's continuity panel of patients relating to both chronic disease management and preventive health care", yet ambulatory care dashboards, if available at all, fail to meet resident specific training needs.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): We sought to design a dashboard to aggregate and display performance measures for resident outpatient care in an instructive and meaningful way for trainees to learn and manage population health.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We devised two focus groups, one comprised of key clinical faculty and one comprised of residents to determine priorities for dashboard design, metrics, and display. Focus groups were led by an independent IT consultant to identify priorities for each group.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): In this stage of the project, identification of stakeholder priorities and completion of the dashboard representing a combination of the features desired by faculty and residents is the main outcome. We will demonstrate each of the features as it relates to the input from the focus groups.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Both the faculty and resident focus groups prioritized accessibility, accuracy in attributing patients, appropriate comparator groups, and having metrics be actionable with ability to drill down into individual patient data. Faculty and residents differed in preferences for certain areas. Faculty were more interested in having fewer, selective, evidence based metrics while residents were in favor of having more comprehensive metrics covering more areas of preventive health. While faculty prioritized having comparator groups by clinic site and PGY year in addition to national benchmarks, residents desired comparator data from other residency programs nationwide. Faculty felt strongly that the comparator information within the program should be de-identified, while residents were more ambiguous about anonymity, at least within the focus group setting. Among options for including message boards within the dashboard, faculty wanted to use these for communicating administrative data for the clinic as well as educational links

related to population health. Residents were more interested in using message boards for peer-to-peer discussions. Finally, while faculty saw the dashboard as a catalyst for QI, residents strongly prioritized dashboard features to enhance safety in clinic. This led to the implementation of features such as metrics tracking of orders and referrals and admissions/ED visits. The resident dashboard is now being implemented and future studeies will include resident satisfaction with performance measures as well as change in key perfoamrnce measures.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): This project highlights key aspects of the dashboard design process including stakeholder involvement as well as content and components to consider. Others wil be able to assess and build upon our features to optimize their own resident dashboard.

DEVELOPMENT OF AN ATRIAL FIBRILLATION SHARED DECISION-MAKING TOOL (AFSDM)

Mark H. Eckman; Ruth E. Wise; Alexandru Costea; Mehran Attari; Jitender Munjal; Robert Ireton; Peter Baker; Carol Knochelmann; Matthew L. Flaherty; Anthony C. Leonard; Brett M. Harnett; Dylan Steen; John Kues. University of Cincinnati, Cincinnati, OH. (Control ID #2697099)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Appropriate thromboprophylaxis for patients with atrial fibrillation (AF) remains a national challenge characterized by both underutilization and at times inappropriate usage of oral anticoagulant therapy.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) develop an AF Shared Decision-Making tool; 2) implement use of this tool within a user friendly decision making process that integrates patient education and informed decision making with well communicated results and treatment recommendations; 3) evaluate the impact of this shared decision making interaction on the quality of decision making and patient knowledge.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We developed the AFSDM to support cardiologists during a shared decision-making encounter in the outpatient setting of an academic medical center. The tool generates patient-specific recommendations for thromboprophylaxis based upon risk factor profiles for stroke and major bleeding, and an assessment of personal values and preferences for relevant health outcomes. Patients participate in two visits. At the first visit, baseline surveys are administered to evaluate measures of confidence, comfort, and satisfaction with their current treatment decision, and knowledge about their personal risk of AF-related stroke and major bleeding. A second appointment is scheduled within 3 months for a shared decision-making visit. During that visit, patients' utilities for relevant health outcomes are assessed. Preference values along with clinical and laboratory information automatically extracted from an AF datamart in our electronic health record are used by the AFSDM to generate patient-specific predictions of quality-adjusted life expectancy for strategies including: no antithrombotic therapy, aspirin, warfarin, apixaban, dabigatran, rivaroxaban, and edoxaban. The computational engine of the AFSDM is a 29-state Markov decision model. The same surveys are completed following the second visit.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Outcome measures include decisional conflict, confidence in decision scale, decision self-efficacy, satisfaction with decision scale, Kim Alliance Scale, desire to participate scale, general knowledge about AF (risks and benefits of therapy), patient-specific knowledge about personal risk profile, and anticoagulant medication adherence.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Planned enrollment is 65 patients. To date, 20 patients have completed the second visit. Qualitative feedback from both patients and physicians has been extremely positive, with robust discussions frequently ensuing. Among these 20 patients average scores for decisional conflict decreased (42 to 11, $p < 0.001$), satisfaction with decision and knowledge both increased (4.0 to 4.6, $p < 0.001$) and (8.6 to 9.5, $p = 0.003$), respectively, following the shared decision-making visit.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Shared decision-making visits between cardiologists and their AF patients, facilitated by an AFSDM that engages patients and provides personalized recommendations can reduce decisional conflict, increase disease specific knowledge, and increase patient satisfaction with the decision-making process.

DEVELOPMENT OF ELECTRONIC SUPPORT TOOLS TO FACILITATE COUNSELING FOR UNHEALTHY ALCOHOL USE IN AN ACADEMIC GENERAL MEDICINE PRACTICE

Scott W. Rose[2]; Shana Ratner[1]; Colleen Barclay[3]; Bailey Minish[1]; Daniel Jonas[1, 3]. [1]UNC Chapel Hill, Chapel Hill, NC; [2]University of North Carolina, Durham, NC; [3]University of North Carolina at Chapel Hill, Carrboro, NC. (Control ID #2707379)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Recommended behavioral interventions for patients with unhealthy alcohol use may not be offered in primary care due to competing demands, provider discomfort, and lack of well-organized support tools to deliver counseling.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): We aimed to utilize new EHR capabilities to create structured support tools for providers in the form of templates quickly generated within the EHR by typing quick shortcuts ("documentation tools") to increase rates of evidence-based counseling and improve documentation.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The UNC Internal Medicine clinic is a large practice with over 90 providers. Our multidisciplinary quality improvement team, including faculty and resident providers, nurses, a patient representative, and a social worker, have been developing standard work protocols for screening and delivering appropriate interventions for unhealthy alcohol use. The clinic previously used paper-based resources. After feedback from providers, we concluded that these resources would preferably be updated and incorporated into the new EHR. Beginning in September 2016, we developed and then disseminated a series of four documentation tools to facilitate multi-visit evidence-based counseling interventions for patients with risky drinking behaviors identified by screening. These include an initial visit tool and 2 follow-up visit tools (following a motivational

interviewing approach and the 5 A's approach: assess, advise, assist, agree, and arrange follow up), and a visit summary documentation tool that includes patient information, resources, and a drinking diary. In the development of the documentation tools we used small tests of change to refine the processes and content, including provider feedback, revisions, and resident training in their use.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The main outcome is how often providers use the documentation tools for eligible patients. Other outcomes will include qualitative assessment through surveys of providers to assess comfort with using the tools, barriers to using them, and provider satisfaction.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Among the 88 patients eligible for behavioral counseling over the initial 2 months since releasing the phrases, 5 (5%) were offered counseling by providers documented with the documentation tools. The initial visit tool was used 3 times. Providers used the visit summary tool 2 times. Surveys to assess qualitative measures are in progress.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): EHR tools have the potential to facilitate delivery and documentation of counseling, but uptake of new tools may require additional provider education, which can be challenging in a large clinic. It is important to collect feedback to better tailor tools for providers that will make counseling a more frequent, effective, and efficient process. We found limited use of the EHR tools, but further assessment is needed as they just recently became available.

DOCUMENTING EARLY ALL-STAKEHOLDER EXPERIENCES OF STANFORD'S PRIMARY CARE 2.0: ETHNOGRAPHY AS A TOOL FOR THE LEARNING HEALTH SYSTEM Nadia Safaeinili; Cati Brown-Johnson; Megan Mahoney; Garrett Chan; Jonathan G. Shaw; Marcy Winget. Stanford School of Medicine, Stanford, CA. (Control ID #2707038)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): When healthcare systems implement large-scale transformation, accessing all stakeholder perspectives infrequently occurs; capturing first-hand experience with ethnography can be instrumental in calibrating clinic practices and establishing a Learning Health System (LHS) culture with early and frequent feedback and partnered interpretation of evaluation results.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): In 2016, Stanford launched a team-based primary care redesign, "Primary Care 2.0" (PC 2.0), aiming to radically transform care from the traditional 1:1 provider:patient model to a novel team-based model, in order to address the Quadruple Aim of healthcare: reduce costs; and improve patient outcomes, patient satisfaction, and medical provider and staff experience. As part of an evaluation process, we conducted a small ethnography study to identify initial barriers and facilitators to the model, and to promote participant engagement.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): On Aug. 25, 2016, we began a 3-day ethnography study, which included 27 hours of clinic observation. During this time, 11 patient visits were observed and brief semi-structured interviews were conducted at the implementation clinic with patients, providers, and CCs. At this time, the PC 2.0 Model was mostly implemented, including: team-based care with Care Coordinators (CC) (ie. enhanced Medical Assistants); provider time to coordinate care; onsite extended care (ie. mental health, pharmacy, PT); Lean management/LHS; Telehealth; and health coaching.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The site visit was presented as an LHS activity; within this framework, our goal was to uncover best practices, weaknesses in the model, and/or actionable insights. The success factors, therefore, were two-fold: 1) our ability to obtain honest and open feedback from all stakeholders; and 2) for stakeholders to receive our feedback with intent to improve.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Ethnographic observation was an acceptable method for patients (0 refusals) and staff. From a patient perspective, the greatest changes with PC 2.0 centered on CCs, team-based care, and the onsite extended care team. These elements focused more attention on patients, with multiple caregivers (eg. provider, CC, extended care team), and provider:patient face-to-face connection unmediated by computer. Opportunities exist to strengthen model fidelity: video visits were underutilized, and health coaching for patients was not implemented. Feedback on the above was given to clinic staff by the evaluation team; clinic leadership reported staff perceived observations as non-judgmental and feedback as helpful.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): An all-stakeholder perspective facilitated by ethnography can be fruitful in the context of clinical change, producing rich and multi-leveled data, suitable for clinic leadership feedback as well as system or model insights. Talking to all stakeholders is important; each group can provide surprising revelations. In particular, the often-overlooked Medical Assistant perspective is critical in team-centered care models.

ELECTRONIC CONSULTATION (E-CONSULT): AN INNOVATIVE TOOL TO ACCESS SPECIALTY CARE AT VA MEDICAL CENTERS IN NEW ENGLAND Eun Ji Kim[2]; Sumeet S. Pawar[1]; Sarah L. Cutrona[4]; Melissa K. Afable[6]; Jay D. Orlander[5]; Gouri Gupte[7]; Judith Strymish[6]; Steven R. Simon[6]; Varsha Vimalananda[3]. [1]Boston Medical Center, Boston, MA; [2]Boston University, Boston, MA; [3]Center for Health Organization and Implementation Research (CHOIR), Bedford, MA; [4]University of Massachusetts Medical School and Meyers Primary Care Institute, Worcester, MA; [5]VA Boston HealthCare System, West Roxbury, MA; [6]VA Boston Healthcare System, Boston, MA; [7]Cambridge Health Alliance, Somerville, MA. (Control ID #2706531)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): There exists a significant delay in access to specialty care and barriers in coordinating specialty referral.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To improve access to cardiology specialists' input

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): In 2010, an electronic consultation (e-consult) program was implemented by the Veterans

Health Administration (VHA) to improve access to specialty care. E-consults allow healthcare providers to obtain specialty input through asynchronous consultation within a shared electronic medical record, allowing rapid communication between primary care physicians (PCPs) and specialists. E-consults may mitigate the need for some traditional face-to-face visits and improve access to specialty care.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We reviewed 408 patient medical charts from 4 VAMCs (Boston, Connecticut, Providence, and Togus). We excluded e-consults requested by non-Medicine specialties. We examined demographic information of patients and requesting providers. We categorized the questions providers asked in e-consults and how cardiologists answered them. We calculated the potential miles avoided by receiving e-consults rather than the face-to-face consult by measuring the distance from the patient's zip code of residence to the cardiology clinic where the e-consult was answered.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Among 408 cardiology e-consults reviewed, medical providers requested 239. E-consults were most commonly used for clinical questions (89%), but 8% were used for administrative purposes and in 3% the reason was unclear. Among clinical e-consults, 37% addressed pre-procedure management; the remainder addressed questions unrelated to pre-procedure care. Among e-consults related to pre-procedure management, general preoperative assessment was the most common topic (47%), followed by anticoagulation management (33%). Among those e-consults unrelated to pre-procedure care, the most common questions addressed diagnostic testing (37%) and therapy (36%). Cardiologists were able to answer a majority (85%) of the e-consult questions asked. Reasons for not answering included lack of sufficient data, such as a recent EKG, absence of comment on presence of cardiac symptoms, or lack of outside medical record. E-consult use allowed patients to avoid travel, on average 37.1 miles (SD = 33.7). One-tenth of the e-consults were recommended by cardiologists to be converted to face-to-face consults.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Primary care physicians and medical specialists used cardiology e-consults to answer wide-range of clinical questions. Notably, over one-third of the e-consults addressed pre-procedure management. Pre-procedure assessment may represent an area where e-consults could be effectively used for professional education and to promote practice-based learning. Providing guidelines for requesting providers regarding necessary data for consult placement should be explored in the future.

ENGAGEMENT WITH A DIABETES COLLABORATIVE CARE TEAM IN A SAFETY-NET CLINIC: WOMEN AND PATIENTS WITH CHRONIC PAIN LESS LIKELY TO ENGAGE Brittaney M. Belyeu[1]; Lydia Chwastiak[4]; Joan Russo[4]; Meghan M. Kiefer[2]; Kathy Mertens[5]; Lisa Chew[3]; Sara L. Jackson[2]. [1]Kaiser Permanente West Los Angeles, Los Angeles, CA; [2]University of Washington, Seattle, WA; [3]University of Washington - Harborview Medical Center, Seattle, WA; [4]University of Washington School of Medicine, Seattle, WA; [5]Harborview Medical Center, Seattle, WA. (Control ID #2703744)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): The Collaborative Care Model improves outcomes and cost in populations with complex medical and psychosocial co-morbidity. However, studies of patient factors associated with non-engagement in such programs are limited.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To evaluate patient factors associated with non-engagement in a Diabetes Collaborative Care Team program in an academic urban safety-net clinic.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We studied the first 18 months of a multi-disciplinary nurse care management team-based program, adapted from an evidence-based collaborative care model for our safety-net population. The program included weekly nutrition, psychiatric and internal medicine consultation and was implemented without external funding. Non-engagement was defined as fewer than two visits with a Diabetes Care Team member during the evaluation period.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Patients who did not engage in the program were compared to those who did engage, with respect to demographics, comorbid medical and psychiatric diagnoses, and cardiovascular risk factors, using univariate and multivariate analyses.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Of the 151 patients referred to the DCCT, 68 (45%) were classified as non-engaged. In unadjusted analyses, patients who did not engage were more likely to be female (48.5% of non-engaged vs. 31.3% engaged, $p = 0.04$), and less likely to have major depressive disorder (13.2% non-engaged vs. 28.9% engaged, $p = 0.03$), anxiety disorder (16.2% vs. 38.6%, $p = 0.003$), or any depression diagnosis (including major depressive disorder, dysthymia, depression not specified) (39.7% non-engaged vs. 61.4% engaged, $p = 0.009$), or hyperlipidemia (73.5% non-engaged vs. 88.0% engaged, $p = 0.03$). Female gender and a chronic pain diagnosis were independently associated with non-engagement after multivariate adjustment (for female gender, odds ratio (OR) of non-engagement 2.51 (95% CI 1.21 to 5.21, $p = 0.01$); chronic pain diagnosis, OR 4.63 (95% CI, 1.13 to 18.99, $p = 0.03$)).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): In this study of patients with poorly-controlled diabetes in a large, urban safety-net primary care clinic, female patients and those with chronic pain diagnoses were less likely to engage with the DCCT program. This suggests the need to address barriers for engagement for female patients, and to integrate chronic pain management strategies within multiple condition Collaborative Care Models.

ENGINEERING HIGH RELIABILITY LEARNING LAB (EHRLL): DESIGNING MORE RELIABLE CARE AT CRITICAL JUNCTURES Sara Singer[4, 1]; James Benneyan[5]; Russell Phillips[1]; Gordon D. Schiff[3]; Joe Kimura[8]; Rose M. Kakoza[3]; Matthew Carmody[6]; Jay Berry[7]; Lindsay S. Hunt[1]; Tsega Tamene[2]; Bethany Maylone[2]; Mariam Krikorian[2]. [1]Harvard Medical School, Boston, MA; [2]Harvard T.H. Chan School of Public Health, Boston, MA; [3]Brigham and Women's Hospital, Boston, MA; [4]Harvard School of Public Health, Boston, MA; [5]Northeastern University, Boston, MA; [6]Mount Auburn Hospital, Cambridge, MA; [7]Boston Children's Hospital, Boston, MA; [8]AtriusHealth, Newton, MA. (Control ID #2706509)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Progress designing safer healthcare processes is often elusive, especially where coordination challenges exist such as between primary and specialty care. To achieve greater and more generalizable breakthroughs, experimentation with new approaches and collaborations is useful.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): (1) Foster a redesign and learning ecosystem that blends systems engineering, organizational, and patient safety methods; (2) Support health systems applying these methods to understand, design, and spread safety innovations; (3) Assess the impact on patient outcomes, engagement, and confidence in their safety.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): EHRLL was established in 2015 under an AHRQ patient safety learning lab program to promote research, learning, and collaboration in new approaches to safety. Four health systems, teams of clinicians, organization experts, and systems engineers applied a common design roadmap to a range of problems (specialty referrals, perioperative care, opioid management, home health care) for which primary-specialty coordination creates safety challenges. The lab uses systems, organizations, and safety theory and methods more successfully used in manufacturing and other highly reliable industries but less so in health care. Teams were supported by weekly faculty coaching, alternating half-day learning sessions and 4-month activity periods, and bimonthly reflection activities and feedback, as well as efforts to study lessons learned about usability, implementation, barriers, and dynamics enabling and limiting these approaches.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Program evaluation uses mixed methods, including data analysis, staff surveys, semi-structured interviews, and ethnographic observations during team meetings and learning sessions. Project-specific evaluation is focused on key indicators for each project and utilization, cost, and quality outcomes.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): After Year 1, all teams have engaged and are making progress using new methods and collaborating within and across teams. Teams have applied swim lane diagrams, failure mode and effects analysis, risk stratification, and other tools, and begun designing new processes based on problem analysis. Approaches have resulted in care redesigns including: prioritization criteria and standardized close-loop referral processes, direct preoperative collaboration between primary care and anesthesia, risk stratified urine toxicity screening for opiod users, and a template for primary-home health communication. Participant evaluations indicate belief that the learning lab is fostering the structure, clarity, and positive environment to spur within- and across-team creativity. Logistics barriers have included onboarding, data access, personnel bandwidth, and continuity.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Embedding engineering concepts and methods into safety projects has potential to help drive complex system understanding and breakthrough improvement, but is more specialized, necessitates different mindsets, moves at a different pace, and presents challenges of working across organizations, cultures, and professions.

ENHANCED CARE PROGRAM, A MODEL FOR COMPLEX CARE MANAGEMENT: QUALITY OF CARE OUTCOMES Swati Shroff[4]; Jodie Bryk[2]; Anita B. Lyons[1]; Deborah M. Simak[3]; Gary Fisher[5]; Wishwa N. Kapoor[3]. [1]UPMC, Pittsburgh, PA; [2]University of Pittsburgh, Pittsburgh, PA, PA; [3]University of Pittsburgh Medical Center, Pittsburgh, PA; [4]University of Pittsburgh/VA Hospital, Pittsburgh, PA; [5]University of Pittsburgh, Pittsburgh, PA. (Control ID #2697639)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Five percent of the population accounts for over half of healthcare expenditures in the US.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Our innovation is the design and implementation of an Enhanced Care Program (ECP) to meet the needs of complex, high-utilizing individuals. The program aims to: reduce unnecessary healthcare utilization, improve quality of care, and improve the patient experience.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The ECP is being implemented in the University of Pittsburgh General Internal Medicine practice in Oakland (GIMO) in collaboration with UPMC Health Plan (UPMC-HP). Individuals are invited to participate if they meet the following criteria: 1) > 1 inpatient hospitalization or > 5 ED visits in previous year; 2) ≥ 18 years of age; 3) UPMC-HP member; 4) Receive primary care at GIMO; and 5) Agree to participate. The ECP is embedded within a patient centered medical home primary care practice. The primary ECP team consists of physicians, nurse care managers, and a secretary, with assistance from a pharmacist, psychologist, and psychiatrist. After individualized care plan development, patients have regular follow up with the team, including 24/7 direct telephone access, same day walk-in appointments and home visits.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Quality of care outcomes include pre and post-ECP adherence to HgbA1C goals, blood pressure goals, and age-appropriate preventive care services after ≥ 6 months of ECP participation.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): From July 2014 to December 2016, 769 patients were screened, and 324 were eligible for the ECP. Of eligible patients, 194 were enrolled and 51 were withdrawn, leaving 143 actively enrolled patients. Of the 194 enrolled, 141 remained in the program for at least 6 months and were included in the quality data analysis if applicable. In hypertensive patients, blood pressure < 140/90 improved from 54 to 68%. For diabetic patients, rates of HgbA1C < 9 improved from 69 to 71%, foot exams 69 to 83%, eye exam 48 to 73%, and blood pressure < 140/90 56 to 66%. Rates of cervical cancer screening improved from 79% to 86%, breast cancer screening 60 to 64%, and colorectal cancer screening 75 to 85%. The rate of patients with mental health illness linked to psychiatric care improved from 53 to 88%, and 20% of patients on chronic opioids were weaned off.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): It has been essential to keep patients engaged through continuous contact, including 24/7 telephone access, flexible appointments, and home visits. Behavioral health resources are important given high rates of mental health illness. Highly coordinated, multidisciplinary care is required for these patients. Staff education on complex patient management is crucial to avoid burnout.

ENHANCING HEPATITIS C AND HIV SCREENING AND LINKAGE TO TREATMENT IN PRIMARY CARE PRACTICE Leah S. Karliner; Brent Kobashi; Chiara Kuryan; Rosemary Lam; Rena K. Fox. UCSF, San Francisco, CA. (Control ID #2706208)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): In light of new and improving treatments, both the Centers for Disease Control and the US Preventative Services Task Force recommend routine screening for hepatitis C (HCV) and HIV; however, it remains a challenge to achieve high rates of screening and then early linkage to treatment in primary care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): In our urban academic general internal medicine (GIM) practice: 1. To substantially increase routine hepatitis C screening for eligible patients born 1945–1965; 2. To substantially increase routine HIV screening for eligible patients age 18–64; 3. For patients with positive results, to offer linkage to treatment options including experts embedded in our own primary care practice and specialists in hepatology and infectious disease in our academic health system.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We formed a work-group made up of three GIM faculty members (QI Director, HCV content expert, HIV content expert - both available to see patients in primary care for linkage to treatment), the practice Quality Analyst, and a Linkage to Care Navigator. We divided plans for the year into three categories: *Laying the Foundation*: We hung educational posters in practice waiting areas, disseminated program information to PCPs via email, newsletters, faculty and team meetings, gave information and received feedback at all-staff meetings, programmed data queries, created a tracking database for patients with positive results; and worked with the lab to develop an in-house HCV-ab with reflex to RNA test. *Screening In-reach*: We worked with Primary Care leadership and IT to add routine HCV and HIV screening for the appropriate cohorts to our EMR Health Care Maintenance (HCM) banner, allowing these topics to become part of our regular work-flow during clinical visits. *Screening Out-reach*: we are in planning stages for outreach efforts.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We have three main measures of success: 1) number of eligible patients screened for each infection, 2) percentage of eligible patients screened for each infection, 3) timeliness of linkage to an appointment at which treatment was discussed and offered.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): In the month after the HCM go-live, HCV screening increased by 30 and HIV screening increased by 56%. Overall since the beginning of the project, the percentage of eligible patients screened for HCV has increased from 60.6% to 65.3%, and for HIV has increased from 46.2 to 48.9%. Our HCV ab positive rate is 3.87% (31/801 tests) and HIV ab positive rate is 0.1% (1/994); of the 10 patients HCV RNA+, 7 have been successfully linked to treatment within 90-days; efforts continue to link the remaining 3 and 1 HIV+ patient.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our program has benefitted from a diverse team with distinct roles. Early engagement of the lab, primary care leadership and IT has helped create the necessary infrastructure for larger-scale screening. Integration of screening into regular work-flow is fundamental to in-reach efforts.

ENHANCING PATIENT ACCESS TO A PRIMARY CARE RESIDENT CLINIC- A QUALITY IMPROVEMENT PROJECT Milind Chaudhari[1]; Roberto O. Diaz Del Carpio[2]; Natdanai Punnanithinont[1]. [1]University at Buffalo, Williamsville, NY; [2]University at Buffalo, Buffalo, NY. (Control ID #2705613)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): A majority of patients experience significant barriers with telephone access to primary care clinic, resulting in increased emergency room visits, and low patient satisfaction.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. To improve patient access to clinic by increasing the percent answered calls by 25% by the end of June 2017. 2. To improve patient satisfaction by enhancing timely access to our clinic staff.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Hertel Elmwood Internal Medicine center is a patient centered medical home serving broad, multicultural and low socioeconomic population in north Buffalo, NY. Based on Institute for Healthcare Improvement model for improvement, we designed a quality improvement (QI) project to identify and address barriers to patient access to our clinic. We first reviewed and analyzed phone triage data to determine current rate of answered calls, average call wait time, and pattern of high volume calls. We shared this data with clinic stakeholders (front desk staff, receptionist, clinical staff) to get their feedback and increase awareness of the problem. Based on initial root cause analysis, we identified front desk staff multitasking, and inadequate staffing as one of the causes for inefficient phone triage. Therefore, our first intervention was to improve call center management by avoiding multitasking and adjusting staffing to meet call volume needs. We also engaged all clinic stakeholders in designing a phone log to identify the reasons for unanswered phone calls. Appointment/scheduling and prescription renewal/refill were among the most common causes for phone calls. We designed patient education program to inform them about the online portal where they can access their data, test results, medications and also contact clinic or physician by email.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): *Outcome Measures*: 1. Percentage of calls answered, 2. Patient satisfaction on clinic access by phone *Process Measures*: 1. Total number of phone calls, 2. Percentage of abandoned calls, 3. Average call wait time *Balancing Measures*: 1. Clerical staff satisfaction, 2. Number of same day appointment

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Initial phone triage data showed that only 50% of the incoming calls were answered by agents, and average call wait time was 7min 07sec. About 80% of our patients reported being dissatisfied when using phone to access our center. Initial analysis of phone logs showed that majority of phone calls are from pharmacies regarding medication refill or renewal. We also noticed that most of the patients were unaware of patient portal and some patient did not know how to use it. Further finding based on our current and subsequent interventions will be discussed.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Timely access to healthcare is the most common and universal issue cited in patient satisfaction survey. A multifaceted intervention, aligning clinical learning priorities, engaging stakeholders, and using QI methodology is necessary for the success of quality improvement project to improve patient access to the clinic. Timely access increases patient satisfaction, and improve all aspects of care delivery.

ENHANCING SPECIALTY ACCESS TO CARE IN A VA SUBACUTE AND CHRONIC CARE MEDICAL UNIT: AN EVALUATION OF ELECTRONIC CONSULTATIONS (E-CONSULTS) Shivani Jindal[1]; Judith Strymish[4]; Marcus D. Ruopp[2]; Amy W. Baughman[4]; Melissa K. Afable[3]; Jay D. Orlander[3]; Steven R. Simon[5]. [1]Boston VA Health Care System, Brockton, MA; [2]VA Boston, Brockton, MA; [3]VA Boston HealthCare System, West Roxbury, MA; [4]VA Boston Healthcare System, Cambridge, MA; [5]VA Boston Healthcare System, Boston, MA. (Control ID #2707394)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Access to specialty care in the Community Living Center (CLC) is logistically challenging for the patients, clinicians and the health system.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Electronic consultations (E-consults) offer referring clinicians specialist input on questions addressable by chart review. E-consults are associated with increased access to subspecialty care, patient satisfaction and clinical efficiency. The landscape of E-consult use in subacute care has not been well characterized.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The VA Boston Healthcare System is a tertiary care facility consisting of 3 geographically dispersed main campuses and 5 community-based outpatient clinics. The CLC is a 110-bed nursing home that provides transitional (skilled nursing or rehabilitation), palliative/hospice and long-term care. The CLC is located more than 20 miles from the medical/surgical acute care services and most subspecialty clinics. In the current model of care, subspecialists do not consult at the bedside but provide expertise by either scheduled outpatient consults or through E-consults. E-consults can provide clinicians with decision-making support to improve clinical care. The process provides access to specialists that may avoid unnecessary travel, decrease amount of admin time to arrange appointments, and limit the disruption in rehabilitation services for patients for whom in-person evaluation is unnecessary. In an effort to improve access to specialty care, VA nationwide has encouraged the use of E-consults, which are asynchronous provider-provider consults on a shared electronic health record (EHR) platform.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): E-consults were introduced to the VA Boston CLC in 2011. This study characterizes all E-consults in the VA Boston CLC since 2011 by specialty, type of question and disease type (within each specialty). Type of question was categorized as: Diagnosis, Prognosis, Management, Self-Improvement and Request for Direction.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): From 2011 to 2016, 474 E-consults were requested from the following specialties: Infectious Diseases (26%), Endocrinology (13%), Cardiology (12%), Hematology (8%), Renal (5%), Urology (4%), Gastroenterology (4%), Psychiatry (4%), Pulmonary (4%). The annual number of E-consults requested from the CLC grew from 14 in 2011 to 141 in 2016. The median time to response within the top ten requested specialties was between 2.28 and 23.95 h. Majority of requests (67.5%) were focused on management followed by diagnosis/work up (23.5%).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): E-consult use in our subacute facility has seen steady increase since introduction with the majority focused on management issues. E- consults enable the avoidance of significant logistic and administrative burden of in-person consults and rapid clinical decision-making support (time to response less than 24 h). Future evaluation includes type of E-consult converted to live visit, efficacy of patient care and clinician satisfaction. This evaluation shows the increasing use and importance of E-consults for access to specialist care for patients in a subacute setting.

ENHANCING THE PREVENTION OF MICROVASCULAR COMPLICATIONS OF DIABETES TYPE 2: A QI PROJECT. Raed Al Yacoub; Adel Hanna; Roberto O. Diaz Del Carpio. University at Buffalo, Buffalo, NY. (Control ID #2705520)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Suboptimal screening rates for DM2 retinopathy and nephropathy in our primary care resident clinic.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Our aim is to improve by 40% the care of patients with DM2 (screening for retinopathy and nephropathy) at HEIMC by July 2017.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): HEIMC, a certified level 3 Patient Centered Medical Home, is an academic internal medicine outpatient center affiliated with the University at Buffalo and part of the Kaleida Health System. We provide primary care for a diverse, mostly low-income, urban population. Our outpatient center has 5 FTE internal medicine attending physicians, 1 nurse practitioner and 31 internal medicine residents that rotate in a 4 + 1 schedule. In our 2015 Physician Quality Review, our DM2 retinopathy and nephropathy screening rates were 28 and 40% respectively. These metrics were suboptimal compared to local, regional and national benchmarks. Based on our root analysis our first intervention combined individual-based-changes by enhancing provider medical knowledge and system-based changes by simplifying the use of our electronic health record (EHR).Our second intervention focused on using reminders and a checklist as part of our organizational change during our morning huddles. Process mapping helped us to simplify our ophthalmology referral process and consult scanning process. Data was analyzed using QI Macros 2015.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Outcomes: Percentage of patients with completed screening labs and ophthalmology consults documented in patients with DM2 on weekly basis. Process Percentage of DM2 patients with

ordered nephropathy screening labs and ophthalmology referrals. Balancing: Percentage of uncontrolled DM2 patients (A1C > 9).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): As of December 2016, the percentage of DM2 patients that have had a retinopathy and nephropathy screening test increased to 40 and 75% respectively. Similarly, orders placed for ophthalmo and nephropathy screening increased to 60 and 70%. Further analysis showed a nonrandom variation trend during the last weeks, especially with received ophthalmology consults. The proportion of patients with uncontrolled DM2 remained the same, 12%.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Despite the availability screening tests, their utilization rates were surprisingly low. This was multifactorial problem and required multifaceted solutions. Because of our project alignment with our clinical learning environment improvement priorities we were able to engage key stakeholders since the beginning and have support from our leadership. Our interventions have improved our quality metrics for DM2 but this is still not sustainable. Further interventions will focus on having point of care retinopathy screening.

ESCALATIONS OF CARE TO THE INPATIENT SETTING DURING HOSPITAL AT HOME ADMISSION Gabriel Silversmith1, 1; Tacara Soones[1]; Christian Escobar[1, 1]; Janeen Marshall[1]; Ania Wajnberg[1, 1]; Albert L. Siu[1]; Linda DeCherrie[1, 1]; Bruce leff[2]. [1]Icahn School of Medicine at Mount Sinai, New York, NY; [2]Johns Hopkins University School of Medicine, Baltimore, MD. (Control ID #2706262)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Hospital at Home (HaH) programs are a safe alternative to inpatient admission; patient safety sometimes requires that HaH patients are escalated to the hospital.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To examine rates and the causes of care escalations.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Funded by the Centers for Medicare and Medicaid Services' Innovation Center (CMMI), the Icahn School of Medicine at Mount Sinai implemented a HaH program called the Mobile Acute Care Team (MACT) in 2014. MACT employs a multidisciplinary team to address acute care needs in the home and provides additional post-acute care for 30 days after discharge. Patients are admitted from the Emergency Department (ED) or from home if they meet medical, geographic, and home safety criteria. Patients are visited up to twice daily by a nurse and daily by a medical provider and may receive IV medicines and fluids, oxygen, nebulizer treatments, and wound care. Labs, xrays, ultrasounds, and EKGs can be performed at home, and patients have telephonic access to a MACT physician 24 hours per day.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Descriptive analysis of MACT HaH hospital escalation rate overall and by sociodemographic and medical characteristics. A rubric for defining reasons for escalations was derived from a published study on readmissions.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Between November 1, 2014 and October 31, 2016, 198 patients were admitted to MACT HaH. Overall, 8.1% (16/198) of patients were escalated. The probability of escalation, by primary admission diagnosis, was: pneumonia 17% (6/36), dehydration 17% (4/24), COPD 11% (2/18), asthma 10% (1/10), cellulitis 9% (2/22), CHF 4% (1/24), UTI 0% (0/48), other 0% (0/16). Of patients under 75 years old, 11% (11/103) were escalated while 5% (5/95) of those age 75 years and older were escalated. The escalation rate was relatively stable over time. Chart reviews of the 16 escalated cases identified the following factors that appeared to play a role in escalations: inadequate response to therapy in the setting of incomplete initial workup and diagnostic uncertainty (in 8/16 escalations), clinical decisions not consistent with guidelines (8/16), unavailable diagnostic procedures in the home (8/16), unavailable therapeutic procedures (6/16), patient/family anxiety (4/16), poor patient/family adherence to the care plan (3/16), inadequate home support (3/16), clinically high risk on admission (2/16), and IV access difficulty (2/16). Patients or families initiated 31% of escalations without clear evidence that this was medically necessary. Following escalation, 2 patients were discharged from the ED; of those who were admitted, the average length of stay was 7.0 +/− 4.5 days.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 8% of HaH patients were escalated to hospital care. This is comparable with an escalation rate reported in the HaH literature. HaH programs may benefit from better standardization of care protocols customized to the home setting.

FEASTWORTHY: A DELIVERED PREPARED MEAL PROGRAM FOR FAMILIES IN MOTEL-SHELTERS Avik Chatterjee[1, 2]; Rory Brown[3]. [1]Harvard Medical School, Cambridge, MA; [2]Boston Health Care for the Homeless Program, Boston, MA; [3]Harvard College, Cambridge, MA. (Control ID #2699751)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Families experiencing homelessness face many barriers to healthful eating—including poor access to healthy food, its high cost, and no facilities to prepare and store meals—as well as high rates of overweight and obesity but also nutritional deficiencies.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To evaluate whether a delivered, prepared meal program is feasible and improves self-reported nutrition behaviors, food security, and health.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Our intervention site was a 60-family motel-shelter where our health center has an outreach clinic. A nearby motel-shelter served as a control site. With community partners, we developed a 3-month delivered, prepared meal program consisting of 5 frozen, microwavable meals/person/week made from donated surplus prepared food from nearby colleges. Meals had at least 1 serving of vegetables, lean meat, and whole grains.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We used baseline and post-program

surveys with targeted questions about eating behaviors, family demographics and food security. We also used semi-structured interviews to assess families' experiences with the program.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Feastworthy delivered 4875 meals to 129 individuals in 38 families. Twenty-two intervention families agreed to participate in the study, but 9 moved out of the shelter before completing the final survey and 4 were lost to follow-up. Nine families at the control shelter participated, but 4 moved out before completing the final survey. 80% of families had a female primary caregiver, and 61% had at least one family member employed. Half of participants were White, 40% Black, and 45% reported Hispanic or Latino ethnicity. 69% of adults and 34% of children were overweight or obese. 94% reported receiving SNAP, and 85% reported low or very low food security. Mean weekly out-of-pocket food expense was $96. In difference-in-differences analysis, vegetable intake increased by 0.98 servings/day ($P = 0.28$) in intervention adults and 0.76 servings/day (0.19) in children, compared to controls. Fast food meals/week and snack food consumption/day also improved, though changes were not statistically significant. Relative food security score improved (−0.22, $P = 0.95$) and out-of-pocket expense on food decreased (−$55, $P = 0.47$). Families were universally knowledgeable about healthy eating: "Healthy food is…vegetables…fruits, whole wheat, yeah, that's healthy food." Post-program, 100% of families were satisfied with Feastworthy, and many described improved food security: "We've been able to actually maintain our food budget around [Feastworthy meals]." As one parent stated, "Feastworthy is something that gives us a little part of our dignity [as parents] back."

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Participants praised the financial and health benefits of Feastworthy. While outcomes improved for almost all measures—improved nutrition as well as food security—high loss to follow-up made finding statistically significant differences difficult. Replicating Feastworthy's model as a policy intervention could improve access to healthy food for homeless families across the US while decreasing food waste.

FEEDBACK FOR DOCTORS ABOUT THEIR NOTES: A MIXED METHODS STUDY OF PATIENTS AT SAFETY-NET CLINICS

Brittaney Belyeu[3]; Jared Klein[2]; Joann G. Elmore[1]; Lisa Reisch[2]; Sue Peacock[2]; Natalia Oster[2]; Sara L. Jackson2. [1]Univ of WA, Seattle, WA; [2]University of Washington, Seattle, WA; [3]Kaiser Permanente West Los Angeles Medical Center, Los Angeles, CA. (Control ID #2703694)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Patients are increasingly offered electronic access to their doctors' clinic notes. While survey data suggests patients perceive benefits from access to their notes, specific feedback from patients about the note content is limited, particularly from patients in safety-net settings.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To increase understanding about safety-net patients perceptions of their doctor's notes, and suggest opportunities for improving communication using the platform of an electronic portal and written notes for this population.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We conducted four focus groups among patients with poorly controlled diabetes attending one of two urban safety-net primary care clinics (3 groups in a large general medicine teaching clinic, and 1 group from an HIV/AIDS clinic) in Washington state. Before participating in the group discussion, patients read their own clinic note and after visit summary from their last visit to the clinic, completed a brief survey, and engaged in discussion about their experience with the electronic health portal and their perceptions of the clinic note and after visit summary.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The pre-discussion group survey collected demographic information and perceptions of their last clinic note, their after visit summary, and their experience using the electronic portal. Focus data were analyzed for themes by three of the study authors.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Twenty-seven patients participated in the four focus groups; 70% were male, 41% were Black, 48% were unemployed or disabled, and 56% reported fair/poor health. Ten had accessed the electronic patient portal. Lack of access or familiarity with technology was the primary reason patients reported for not accessing ($n = 7$). In each focus group one or more portal users were enthusiastically willing to teach others. A minority of patients felt that the notes were not accurate (19%), had too much medical jargon (29%) or were too long (26%), while the majority felt their note content was clear and useful (89%). Themes identified in the discussion included identification of inaccuracies in notes, particularly in heavily templated note fields; reliance on the provider to explain what the patient does not understand; and desire for more detail rather then less.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The majority of safety-net focus group participants had not accessed the electronic portal, but those who had were motivated to promote the portal benefits and assist others. Patients identified specific opportunities to improve clinic notes and fter visit summaries, yet generally found the content useful.

FIT IN FIVE: A UNIQUE APPROACH TO PREVENTING BURNOUT IN AN INTERNAL MEDICINE RESIDENCY PROGRAM

Lindsey Rearigh[1]; Kristin Olson1; Russell Hamilton[1]; Brian Whyms[1]; Rajveer Sangera[1, 2]; Louise Convery[1]; Daniela Frankova[1]. [1]Mercy Medical Center, Des Moines, IA; [2]Deborah Heart and Lung, Browns Mill, NJ. (Control ID #2706557)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): As physician burnout rates continue to climb, increasing attention is now focused on burnout in residency training programs, residents experiencing burnout are high-risk to become burned out physicians.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): A wellness program termed "Fit in Five" was developed among an Internal Medicine residency consisting of 29 residents. The objectives of the program were to decrease burnout rates among the residency members, improve program communication, and focus on individual self-care.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT,

PRACTICE OR COMMUNITY CHARACTERISTICS): Fit in Five consisted of a five-month competition beginning January 1st and ending May 31st, which combined monthly well-being goals with different team competitions. All residents, attendings, and staff were encouraged to participate, with a total of 28 residents, nine attendings and one staff member joining. Participants were divided into two teams with each team having a captain. Each participant was to submit an individual, measureable goal to their team captain at the beginning of every month; examples included weight loss, nutritional, and exercise goals. At the end of each month, team members were to check in with their captain as to whether or not they have accomplished their monthly goal. Team competitions ranged from dodge ball games to basketball tournaments, with a different competition planned each of the five months. Implementing team activities encouraged teamwork and increased communication skills, while the monthly goals focused on individual health and well-being.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): An abbreviated Maslach Burnout Inventory (A-MBI) was distributed prior to the beginning of Fit in Five. The A-MBI is an anonymous survey consisting of fifteen questions that were used to determine levels of burnout among individual participants as well as the residency as a whole. Questions assessed three categories including emotional exhaustion, depersonalization and personal accomplishment. Burnout rates were determined based upon a combined score of emotional exhaustion and depersonalization. Participates that scored greater than the 75th percentile fell into the severe burnout category.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A pre-intervention response rate of 51% has been reported with an overall burnout rate of 25%. The highest rate of burnout was recorded among residents in their second and third years of training. Personal accomplishment was high among almost all participants with only 5% scoring low in this category. A post-intervention A-MBI will be distributed following the program completion to allow comparison of pre-intervention and post-intervention burnout rates.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Consequences of burnout can be quite high with severe burnout affecting job performance and patient care. Increased attention to interventions such as this may help decrease burnout rates among residents and hopefully lead to decreased burnout rates once residents become practicing physicians.

FRESH PRESCRIPTION: IMPROVING NUTRITION EDUCATION AND ACCESS TO FRESH PRODUCE IN DETROIT Jasmine Omar[2]; Danielle L. Heidemann[1]; Barbara Blum-Alexandar[3]; Chinyere Uju-Eke[3]; Zarina Alam[3]; David E. Willens[1]; Kimberlydawn Wisdom[1]. [1]Henry Ford Health System, Detroit, MI; [2]Henry Ford Hospital, Macomb, MI; [3]Henry Ford Hospital, Detroit, MI. (Control ID #2706393)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Lack of basic knowledge of nutrition and limited access to fresh produce contribute to difficulty in controlling chronic diseases like obesity, diabetes, and cardiovascular disease among underserved adults in Detroit.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To improve patient's knowledge of nutrition and confidence in their ability to eat healthy. To improve access to fresh produce by 1) providing financial support, 2) introducing patients to new local Detroit farmer's markets.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Fresh Prescription is a program that serves patients at several different sites in the Detroit area. We implemented Fresh Prescription at our tertiary-care academic institution in the outpatient Internal Medicine clinic. Eligible participants with body mass index >25 and motivation to learn healthy eating habits were enrolled by their primary care physician from July- September 2016. Participants were given a $10 reward on a rechargeable debit card for completing a nutrition educational counseling session, which could include tele-counseling, cooking demonstrations, and other events. They were able to redeem their reward at local farmer's markets or with boxed food deliveries to receive a maximum total of $40 in fresh produce. Patients underwent a total of 4 counseling sessions over 6 weeks and received an additional $20 boxed food delivery for returning for a 12 week follow up.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Success was measured through comparison of pre- and post-survey responses.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A total of 149 patients were referred to the program by their primary care physician. 39 of these patients were enrolled, and 28 patients completed the program (72% completion rate). Post-survey responses are available for 27 of the 39 patients enrolled in the program. 96% of participants reported they were better able to manage their health and their chronic conditions. 78% of participants reported an increase in their daily intake for fresh fruits and vegetables, with an average increase of 2 cups/day. 48% of participants reported a decrease in their intake of unhealthy food items, with an average decrease of 1 item/day. There was an increase in measures of knowledge base, which included ability to select, prepare, and store fresh produce. 85% of participants reported better knowledge of where to buy fresh produce. Price, access, and transportation were still noted to be barriers for many participants. Of the 39 patients who completed the program, 16 returned for follow up on biometrics, including weight and blood pressure. 5 of 16 participants had weight loss, and 5 of 16 had improvement in blood pressure.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Increasing general nutrition knowledge base among participants led to an increase in the amount of fresh produce consumed, a decrease in unhealthy food items consumed, and increase in ability to manage chronic health conditions. Providing financial resources and improving access to fresh produce are important in supporting patients in an underserved population while encouraging healthy eating habits.

FROM FOE TO FRIEND: MAKING THE ELECTRONIC HEALTH RECORD (EHR) WORK FOR YOU Tanvir Hussain[2]; Elizabeth Lyden[1]; Nizar Wehbi[2]; Lynette Smith[2]; Michael Ash[2]. [1]UNMC, Omaha, NE; [2]Unversity of Nebraska Medical Center, Omaha, NE. (Control ID #2707606)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Provider groups require practical strategies for Medicare's new Quality Payment Program (QPP) which will use performance data beginning January 2017

on a minimum of six clinical quality measures to determine Part B reimbursement.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To use clinical decision support (CDS) to improve performance on quality measures

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We designed CDS, named quality measure alerts, or QMAs, for the ambulatory EHR, Epic, for 12 quality measures, which were released over three phases (March, June, September of 2016), across 42 primary care and specialty clinics at an academic health system in Omaha, NE. Phase 1 QMAs included obesity screening and counseling (S&C), breast cancer screening, depression S&C, and influenza immunization. Phase 2 included medicine reconciliation, fall risk screening, hemoglobin A1c control, and tobacco use S&C. Phase 3 included blood pressure control, colon cancer screening, pneumonia vaccination for 65+, and aspirin in vascular disease. QMAs follow PQRS measure specifications. QMAs identify open care gaps and provide instructions tailored to the licensed scope of practice of medical assistants and nurses (who routinely room patients), with expanded single click orders or documentation features and patient data relevant for providers. For example, rooming staff are nudged to screen patients for depression so that providers need only to counsel patients who screen positive. Care provided by one team member modifies the QMA action suggested to subsequent team members in real time until the quality gap is closed. QMAs are clinician-driven self-checks, not pop-ups or hard stops.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): To determine if the trend in monthly performance improved with the implementation of QMAs, we used a generalized estimating equations approach to fit an interrupted time-series model for each of the quality measures. We restricted analysis to the 77,538 patients seen both in 2015 and in 2016 to reduce confounding due to patient factors. We performed sensitivity analyses introducing indicator variables for each QMA phase to test if performance changed as new measures were added and also modeled results including all patient visits.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Trend in monthly performance statistically significant improved following the implementation of the respective CDS for each of the 12 quality measures. Performance improvement was maintained or accelerated with the introduction of new quality measures. Using 2015 national peer benchmarking data, average percentile performance across the twelve measures increased from the 42%-tile in 2015 to 71%-tile in 2016. Findings did not change in sensitivity analyses.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): One physician quality executive and two clinical informaticists, 0.25 FTE each for nine months, were dedicated to this project. Clinician engagement, technical support from the EHR vendor, and change management strategies targeted at physicians were critical to QMA adoption and success.

GETTING WITH THE GUIDELINES: DEINTENSIFICATION OF GLYCEMIC CONTROL AMONG ELDERLY PATIENTS WITH DIABETES ACROSS TWO GENERAL INTERNAL MEDICINE TEACHING PRACTICES

Betsy Varghese[3]; Robertino Garcia-Cortes[3]; John A. Andrilli[2]; Alfred Burger[4]; Joyce Fogel[3]; Daniel I. Steinberg[1]. [1]Beth Israel Medical Center, New York, NY; [2]Mount Sinai Beth Israel, New York, NY; [3]Mount Sinai Beth Israel, Union City, NJ; [4]Mount Sinai Beth Israel, Icahn School of Medicine at Mount Sinai, New York, NY. (Control ID #2708376)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): One of the American Geriatric Society Choosing Wisely recommendations is to avoid intensive glucose control in elderly patients with type 2 diabetes as it increases the risk of hypoglycemia and medication related side effects without improving clinical outcomes.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Reduce the number of patients seen at 2 teaching clinics with type 2 DM > 75 years old and a hemoglobin A1C less than 7.0% by 15% over one year. 2. Maintain reasonable control with a HgbA1c of less than 9.0% in patients whose regimen is deescalated. 3. Educate faculty and residents on appropriate DM management in the >75 population in accordance with AGS and ADA recommendations.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Medical residents and faculty practicing at one of two resident primary clinic sites will participate in a one hour interactive, case-based learning session on deintensification of therapy in patients over the age of 75 with type 2 diabetes. Resources will include the AGS Choosing Wisely guideline and the American Diabetes Association's suggested approach to determining the appropriate hemoglobin A1c for older patients. Residents and faculty will learn a standard approach to deintensification of therapy that includes removing or reducing sulfonylurea medications, making maximum safe use of metformin and reducing dosages of insulin. Patients will be identified at their next visit via an electronic alert that will prompt their provider to evaluate them for deintensification. The standard approach taught in the educational session will be posted in exam rooms as well as printed on a laminated pocket card that will be distributed to residents and faculty.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): After deintensification, a follow-up hemoglobin A1c will be measured 3 months later and then as clinically indicated. The most recent hemoglobin A1c measurement will be counted as the outcome measure for each patient.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A query of our electronic health record revealed 84 patients at Clinic A and 140 patients at Clinic B who are greater than 75 years old and have a hemoglobin A1c of less than 7.0%. Our target of 15% reduction in hemoglobin A1C would positively impact 34 patients.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): By highlighting the prevalence of intensive glucose control in the elderly population and educating primary care physicians on a systematic method for deintensification, we hope to provide a valuable approach for reducing polypharmacy and adverse outcomes related to type 2 diabetes management.

GOALS OF CARE DOCUMENTATION: A STANDARD OF CARE WHICH IS EASIER SAID THAN DONE
Tuyet-Trinh Truong[2]; Julie M. Pearson[2]; Vinh-Tung Nguyen[1]; Beth G. Raucher[3]. [1]Icahn School of Medicine at Mount Sinai, New York, NY; [2]Mount Sinai Hospital, New York, NY; [3]Mount Sinai School of Medicine, New York, NY. (Control ID #2705846)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Despite the benefits of GOC discussions inpatient providers frequently fail to have this conversation and/or adequately document it in the electronic medical record (EMR), leading to potential delays in resuscitation efforts or against a patient's wishes, urgent/rushed conversations during critical illness, or serious medical errors.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): A physician-lead mortality review workgroup comprised of 30 hospitalists, sub-specialists and internal medicine residents found that advanced planning and GOC documentation was inadequate in nearly 20% of cases reviewed ($N = 126$, Oct 14–Sept 15) and only 30% of cases had a palliative care (PC) consult. A subcommittee was formed to address these deficiencies with the following objectives: 1) improve physician communication skills regarding end of life care, 2) improve GOC documentation in the EMR, and 3) increase PC involvement.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): An online mortality review tool was completed for all mortalities on a medicine inpatient service (teaching and non-teaching). The tool assessed completeness of documentation, adequacy of handoffs and supervision, diagnostic errors/delays, medication or treatment errors, adverse events, and appropriate care escalation. Questions on end of life care include documentation of advanced directives and involvement of PC. The main barriers to adequate GOC documentation were inability of patients to participate, lack of healthcare proxy or surrogate, disagreement between family members (including cases where discussions were had but there was no clear decision made), and death early in the hospitalization. Surprisingly, providers did not identify personal discomfort in having the GOC discussion. A multi-modal approach was used to address these barriers. Educational sessions with residents and hospitalists using case-based examples with inadequate GOC documentation were utilized to facilitate a conversation about barriers and how to overcome them. A standardized EMR tab to document advanced directions was developed and disseminated to attending and housestaff physicians. Hospitalists were also selected to participate in a 6-week Geriatrics Communication Course which included role playing for difficult GOC discussions.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The mortality review group continued to assess cases for adequate GOC documentation (measured by completeness of advanced directive EMR aid) and PC involvement (as yes or no question regarding the presence of a PC consult).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Of 122 cases reviewed (Oct 15–Mar 16), only 6% of cases reviewed had inadequate GOC documentation. PC involvement increased to almost 60% in the same timeframe.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): GOC documentation is often inadequate which can lead to confusion and errors when a life threatening event occurs. Compliance with documentation and involvement of PC improved when providers were made aware of the problem and given a template which included all of the required fields to ensure complete documentation.

HENNEPIN HEALTH ACCESS CLINIC: PAYER-PROVIDER PARTNERSHIPS ADDRESSING PSYCHOSOCIAL BARRIERS IN PRIMARY CARE
Kate Hust. Hennepin County Medical Center, Minneapolis, MN. (Control ID #2702849)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Does engagement in team-based primary care with payer-specific partnerships increase primary care engagement and decrease utilization of emergency and inpatient services?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Provide services for a population of Hennepin Health members to (1) decrease emergency department utilization, (2) decrease inpatient hospitalizations, and (3) increase engagement in primary care.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The Hennepin Health Access (HHA) Clinic provides team-based primary care within a safety-net health system in Minneapolis. The clinic aims to address psychosocial barriers to engagement in traditional primary care for single adults covered by a unique Medicaid payer, Hennepin Health (a managed care program partnering with the county departments of public health and human services, the local safety-net hospital, and a local community health center). HHA patients are mostly men and younger than 50 years old. They have high rates of homelessness (78%), chemical dependency (68%), and mental illness (75%). The clinic team includes a psychologist, a chemical dependency counselor, care coordination staff, and medical providers. Utilizing payer-specific resources, the HHA team works closely with community-based providers for mobile case management and housing navigation.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Anecdotal evidence suggests there are fewer ED visits and hospitalizations for patients after engagement with HHA. Chart review of the first patients to visit the HHA Clinic compared utilization of ED services and inpatient admissions in the year prior to their first clinic visit with utilization patterns after engagement. Only patients with at least 6 months of post-engagement data available were included, and rates were adjusted to represent average annual utilization. Data were analyzed using paired t-tests. Visits with the HHA team were counted as a marker of primary care engagement.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Chart review of 222 individuals showed downward trend in ED visits and hospitalizations, comparing both average and total occurrences, but no significant difference in pre- and post-engagement utilization ($p = 0.44$ for medical hospitalizations, $p > 0.9$ for psychiatric hospitalizations, urgent care, ED, and psychiatric ED visits). Patients had an average of 12.3 total clinic visits in 12 months: 5.87 medical, 3.45 care coordination, 1.52 chemical dependency, and 1.48 psychology. While there is no statistically significant difference in

utilization based on this chart review, data previously collected by Hennepin Health did show economic impact with total per member per month (PMPM) costs decreasing 36.4% after at least one encounter in the HHA Clinic. ED and inpatient PMPM claims costs decreased 56.8 and 54.2% respectively with a 13.5% increase in outpatient PMPM claims costs.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Expanding primary care teams to include experts in addressing psychosocial needs may change patients' utilization patterns. It also provides support to primary care providers whose patients' may need stabilization of basic needs prior to successful engagement with a medical regimen.

HIGH-RISK COPD ASYNCHRONOUS SPECIALTY REVIEW Luis Ticona[1]; Susan A. Goldstein[2]; Jessica McCannon[2]; Sandhya K. Rao[1]. [1]Massachusetts General Hospital, Boston, MA; [2]Mass General Hospital, Boston, MA. (Control ID #2705955)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Implementation of guideline or evidence based therapies, confirmation of disease diagnosis, and use of interventions such as pulmonary rehab, chronic oxygen therapy, and vaccinations by primary care physicians is uneven.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) Develop an algorithm to identify 'high risk' COPD patients using administrative and billing data 2) Complete a pulmonologist COPD chart review to identify gaps in guideline driven therapy 3) Disseminate reports that alert primary care providers to existing gaps of care

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): In 2012, approximately 4300 patients had a diagnosis of COPD at MGH. There were 567 COPD-related admissions in this population, with a 30 day readmission rate of 21%. While it is known that this is often a high risk population; the observed to expected admissions ratio using risk adjusted data was 1.18. When compared to a population of similar risk status (age, gender and co-morbidities), the patient population of MGH had a proportionally higher hospital readmission rate. Additionally, there is evidence that readmissions after discharge with COPD were higher in the community health centers affiliated with MGH than in other academic practices, reaching almost 35%. Billing data can be used to design algorithms to identify potentially 'high risk' patients for COPD, using hospital and ED utilization, as well as clinical features such as the number of exacerbations during a year. Based on the algorithm, 70% (50/71) of patients were flagged as potentially "high risk". As care of COPD patients is shared among primary care providers, subspecialty providers in inpatient and outpatient care settings; multidisciplinary partnerships are needed to improve care of patients with COPD. We partnered with a pulmonologist to review the potential high risk cases identified, as described above, to quantify the gaps of care across several guideline driven aspects of COPD care, including appropriate diagnosis, pharmacologic therapy, and vaccinations.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1)Physician assessment of report utility (SURVEY) 2)Count of recommended changes/patient (Chart review database): Proportion of patients with 1 recommended change, 2 recommended changes, >2 recommended changes 3)Count of completed recommendations/patient: At 3 and 6 months. 4)Coung of high Yield recommendations: (Pulmonary rehab, Lung cancer screening, diagnosis of COPD). *Future metrics*: Number of Urgent care visits, ED visits, COPD admissions 6 months post report dissemination.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Pulmonology Chart review findings: (Amongst many other findings) −32% had no record of spirometry −30% needed different or extra medications −46% needed cancer screening −81% needed pulmonary rehabilitation

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): −Specialty review of high risk COPD patients is feasible, and relatively easy to do for pulmonology staff using an electronic medical record. -High Risk COPD patients without a pulmonologist have significant gaps in care. -Partnering with specialty providers to asynchronously review high-risk cases can yield valuable clinical information.

HIGH-VALUE CHRONIC KIDNEY DISEASE CARE: DESIGNING A COMPREHENSIVE OUTPATIENT PROGRAM TO TRANSITION PATIENTS TO RENAL REPLACEMENT THERAPY Daniela Iribarne; Sri Lekha Tummalapalli; Alexis Kowalski; Joji Tokita; Lindsay E. Jubelt. Icahn School of Medicine at Mount Sinai, New York, NY. (Control ID #2706320)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Sixty percent of patients with end-stage renal disease (ESRD) in our health system start renal replacement therapy (RRT) via unplanned hemodialysis, which is associated with higher use of central venous catheters, higher hospitalization and mortality rates, and higher costs.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) Identify patients with chronic kidney disease (CKD) at high risk of progressing to ESRD, 2) educate patients on RRT treatment modality options, and 3) increase the percentage of patients with CKD undergoing a timely and planned transition to RRT.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Our intervention is a CKD transitions clinic that incorporates automated patient identification, shared decision-making, and standardized care pathways. To inform the clinic design, we conducted semi-structured interviews with supervisors of eight external CKD transitions programs identified by convenience sampling. Based on our findings, we staffed the clinic with a clinical nurse specialist, a care coordinator, and a nephrologist. We developed an algorithm that creates a registry of CKD patients from the electronic health record. Eligible patients had CKD with an estimated glomerular filtration rate (eGFR) $<20mL/min/1.73^2$ and a visit within the health system in the last 18 months. Once referred, a patient has a 1:1 intake evaluation with the nurse to collect key pieces of medical information and identify readiness for the program. Subsequent visits use shared decision-making to help the patient select an RRT modality. The patient then follows a standardized care pathway tailored to the modality choice. The care coordinator oversees the patient's trajectory through the care pathway to ensure timely access and adherence to the treatment plan. The nephrologist and nurse specialist work together to ensure patients are meeting evidence-based CKD quality measures.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO

EVALUATE PROGRAM/INTERVENTION): Our primary outcome measure is rate of planned outpatient RRT initiation. Secondary outcome measures are rate of RRT initiation with home modalities and rate of central venous catheter use for RRT initiation.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Our automated electronic registry identified 2,436 patients with high-risk CKD. Of these, only 473 (19%) had a recent visit with a nephrologist. Our interviews identified the following themes in CKD transitions care: 1) extended visits for patient education, 2) multidisciplinary involvement including vascular surgery, 3) technology solutions that automate evidence-based medical practices, and 4) operation under alternative reimbursement models.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The large number of patients in our health system with high-risk CKD who are not yet engaged in nephrology care confirms a strong need for a proactive and coordinated CKD transitions program. Early results from external multidisciplinary CKD programs show a higher utilization of home RRT modalities. More information is needed to better understand patient barriers to planned RRT and cost effectiveness of our intervention.

HIGHLY SUCCESSFUL EFFECTIVENESS OF TOBACCO USE SCREENING AT OUTSET OF ALL INPATIENT ENCOUNTERS, AN INSTITUTION-WIDE INITIATIVE

Alpesh Amin. UC Irvine, Orange, CA. (Control ID #2707726)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): To analyze the effectiveness of an initiative to screen for tobacco use, screen for willingness to quit, and refer appropriate patients for treatment at the beginning of all inpatient encounters.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Tobacco use is the leading cause of preventable morbidity and mortality in the nation and continues to be a major contributor of excess medical care costs. Despite widespread education about the adverse health effects of cigarette smoking, approximately 40 million adults continue to smoke in the US today. For this reason, tobacco cessation techniques remain a heavily studied preventive medicine topic. This study analyzes (1) the effectiveness of an initiative to screen for tobacco use, (2) screen for willingness to quit, and (3) refer appropriate patients for treatment at the beginning of all inpatient encounters at UC Irvine Medical Center.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Hospitalist led, institution-wide training and EMR changes were initiated to facilitate screening of all adult hospitalized patients. Novel workflows were created, with RNs/MAs involved with patient intake, were tasked with initiation of screening and referral to tobacco use quit-line. These workflows standardized the process of tobacco use screening, referral, and follow up for all patients. A significant change in our workflows was that the initial assessment of current tobacco use and willingness to quit made by a RN or MA at the beginning of an encounter. Tobacco users with an interest in quitting were automatically referred to a cessation program using a custom designed electronic referral through our EMR system to a hotline 90 miles away. Physicians then reviewed the screening results and were able to provide counseling and/or pharmacologic treatment.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): This study analyzed the effectiveness of this practice, which differed from other institutions where assessment of tobacco use and willingness to quit was made at a later time than the outset of an encounter or admission, and was most often done by a physician.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): All adult patients seen in the hospital were included in this study; no patients were excluded. There was nearly a ten-fold increase institution-wide in total number of patients screened for tobacco use, with greater than 97% of patient's screened. Over a 7 month period, a total of 776 patients were referred to the quit-line, with 367 (47.3%) of those patients being successfully enrolled, surpassing totals at comparison institutions within the same collaborative over the same period of time.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Initiating tobacco use screening and cessation techniques utilizing a team approach at the beginning of the encounter by non-physician staff is effective compared to physician-initiated screening later in encounter or hospital admission. Our workflows automate the process of tobacco use screening and willingness to quit, are highly effective, and resulted in nearly universal screening of adult inpatient encounters. These efforts helped UC Irvine physicians achieve success in PQRS preventive care measures for tobacco use.

HOW FEASIBLE IS ELECTRONIC PORTAL ACCESS TO INPATIENT DISCHARGE SUMMARIES FOR PATIENTS IN A SAFETY-NET HOSPITAL?

Jacob Stein[1]; Jared W. Klein[2]; Sue Peacock[2]; Natalia Oster[2]; Sara L. Jackson[2]; Thomas Payne[2]; Joann G. Elmore[1]. [1]Univ of WA, Seattle, WA; [2]University of Washington, Seattle, WA. (Control ID #2706733)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Patients' access to their outpatient electronic medical records via online portals may increase patient satisfaction and understanding of their health care. However, little is known about the utilization and acceptability of patient access to *inpatient* medical records post-discharge, especially among vulnerable patient populations.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To evaluate the feasibility of electronically communicating inpatient discharge summary records to vulnerable patient populations via a secure online portal.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Over a 6-week period in 2016, daily admissions to the medicine service of a public safety-net hospital were reviewed by a study physician. Potentially eligible patients were age 18 or older, spoke English, considered mentally and physically competent, with likely discharge to home. Study staff then approached potentially eligible patients to further assess eligibility, and determine if the patient had access to both email and a telephone. All eligible patients who consented to the study were then randomized to receive either 1) an intervention that included a personal training session about using an electronic patient portal or 2) usual discharge planning and care instructions. Patients randomized to the intervention were scheduled to receive two email reminders to log into the patient portal

within one week of being discharged. A follow-up survey was conducted with all patients (intervention and control) two weeks after discharge.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): A follow-up survey was conducted with all patients (intervention and control) two weeks after discharge, initially by email, and if no response then via telephone, email, and postal mail.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Of the 533 charts reviewed during the study period, 108 (20.3%) were not approachable (e.g., they could not be located or were indisposed each time staff sought them out prior to discharge), 219 (41.1%) were ineligible, and 87 (37.3%) reported having no email and thus would not be able to access the electronic portal. Of the 107 eligible and consented patients, 67 were randomized to the intervention and 40 to the control (usual discharge care). We are currently in the process of conducting follow-up surveys, and thus far have found that patients often provided unusable email and telephone addresses (data collection ongoing).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): At least one third of patients assessed for inclusion in this safety-net hospital population did not have email access; among those who reported having email addresses, many were not usable. These pilot data have implications for better understanding the utilization and effectiveness of electronic communication with vulnerable patient populations with complex medical conditions. Use of peer navigators or post-discharge outreach medical providers could be an effective link for high-risk patients' continuity of care and may improve the potential utility of electronic health information in patient care.

IMPACT OF A HIGH VALUE CARE CHAMPION ON PHYSICIAN ORDERING PRACTICES DURING A 3RD YEAR INTERNAL MEDICINE CLERKSHIP Ryan Nall. University of Florida, Gainseville, FL. (Control ID #2707360)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can a 3rd year medical student serving as a high value care (HVC) champion impact physician ordering practices?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The objectives of this intervention are twofold. First, to evaluate whether by serving as a HVC champion, 3rd year medical students on an inpatient internal medicine teaching service can reduce the ordering of unnecessary tests and procedures by physicians on the team. Second, to assess the effect playing an active role in HVC has on students' attitudes about HVC.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): All students on the internal medicine clerkship at the University of Florida College of Medicine learn about HVC through a series of online self-study modules. This intervention added an additional 15 min orientation for all students on the Society of Hospital Medicine's 5 "Choosing Wisely" Guidelines during the orientation for the rotation. A subgroup of students rotating on two of the internal medicine teams were oriented, to the role of HVC champions through a 15 min presentation on ways they can advocate for the HVC guidelines. They were encouraged to initiate discussion of HVC on rounds and serve as a reminder to the SHM's "Choosing Wisely" Guidelines. How the students decided to implement the role of HVC Champion was up to them, there were no defined expectations. Examples of ways to advocate for HVC included but weren't limited to: − Giving a short presentation on the SHM "Choosing Wisely" Guidelines to the team - Reviewing the team's patient list each day before rounds with the senior resident and identify all patients on telemetry or with a urinary catheter and discuss with the team if these interventions are still needed - Reviewing "daily labs" ordered for the team's patients with interns and resident to determine if chemistry panels and CBCs are still indicated on a daily basis - Asking a question about the value of a particular test or treatment on rounds - Starting a discussion about the indications for red blood cell transfusion All attendings, residents, and interns on the intervention teams will be made aware of this project and the role of the HVC champion through an email at the beginning of rotation.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Data on number of CBCs, CMPs, red blood cell transfusions, telemetry days, urinary catheter days, age, gender, admitting diagnosis, and length of stay will be collected for patients cared for on the teams with a high value care champion. The same data will be compared to teams without a student serving in this role. Retrospective data on ordering practices will also be reviewed.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Data is currently under active review and will be available at the time of the conference.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): This intervention demonstrates a unique approach (one other similar project to our knowledge) to both educating students on high value care principals and attempting to impact physician ordering practices and reduce unnecessary tests and procedures. The approach would be easily dissmeninated at other academic medical centers.

IMPLEMENTATION OF A NALOXONE PRESCRIBING TOOLKIT IN AN ACADEMIC PRIMARY CARE CLINIC Benjamin A. Howell[1]; Tamara Malm[2]. [1]Yale School of Medicine, New Haven, CT; [2]University of St. Joseph, West Hartford, CT. (Control ID #2705481)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Despite many patients in primary care clinics being at high risk for opiate overdose, the rate of prescribing naloxone in primary care remains low.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To increase knowledge of and comfort with prescribing naloxone among internal medicine residents. To address barriers to prescribing naloxone to patients at high risk of opiate overdose in a primary care clinic.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): It has previously been determined by this group that the naloxone prescribing rate for patients at high risk of opiate overdose in our primary care clinic is ~2%, despite the increased awareness of opioid-related deaths. Internal medicine residents and attendings were surveyed to determine barriers to prescribing naloxone, and it was found that there was a gap in both knowledge of the product and comfort

with prescribing. An interdisciplinary team, including pharmacists and physicians, was assembled to develop and implement a Naloxone Prescribing Toolkit. The toolkit included checklists and other resources for counselling and prescribing naloxone based on the barriers identified by physicians in the survey. These included how to take a thorough history around opioid use, language for discussion of opioid use, signs and symptoms of overdose and how naloxone works, specific diagrams and directions for use of each naloxone formulation, and steps for proper follow-up with patients after naloxone has been prescribed. The toolkit was disseminated via regular educational sessions for medicine residents. Personalized letters to every provider were disseminated, listing names of patients on their patient panel that were eligible for naloxone prescription.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): After 3 and 6 months of the intervention, we will reassess the rate of naloxone prescribing in our primary care clinic. Additionally, monthly feedback on the accuracy of the patients listed on the personalized letter, and the utility of the educational sessions, and toolkit will be used to further refine the Naloxone Prescribing Toolkit.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Anecdotally, both resident and attending physicians at our Primary Care Center have inquired about naloxone prescribing and asked for guidance in correct naloxone teaching and prescribing since the implementation of the intervention. Feedback from physicians to date has uncovered weaknesses in the report used to generate patient lists for each PCP. Subsequently, different methods for collecting this information from the EMR are being investigated.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Despite the increased awareness of the opioid epidemic rates of naloxone prescribing in primary care are still low creating barriers to accessing this life-saving medication. Before our intervention many medical residents lacked basic knowledge about assessing risk of opiate overdose and were ill equipped to prescribe naloxone, lacking the necessary tools to discuss different naloxone formulations and comfort prescribing this medication. Physicians and pharmacists can work together to ensure that patients at high risk of overdose receive thorough counseling and access to naloxone.

IMPLEMENTATION OF A PHARMACIST-DELIVERED ASTHMA EDUCATION AND MANAGEMENT PROGRAM IN A COMMUNITY TEACHING PRACTICE Brandon Sucher[4]; Laura Sherman[2]; Nicole Soiseth[2]; Dale Terasaki[2]; Angela Thompson[3]; Elisabeth Ihler[1, 2]. [1]Presbyterian/St. Luke's Medical Center, Denver, CO; [2]University of Colorado, Aurora, CO; [3]University of Colorado School of Pharmacy, Aurora, CO; [4]Regis University School of Pharmacy, Denver, CO. (Control ID #2705302)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Poor patient understanding of asthma has been shown to be associated with increased morbidity.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To identify patients with poorly controlled asthma To improve adherence to standard guidelines for asthma care To improve asthma control in these patients

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): A comprehensive asthma education and management program (CAEMP) was implemented in a primary care teaching practice. Physicians used the clinic EHR and "warm handoffs" when possible to refer patients to the CAEMP. The CAEMP was free to patients and was delivered by onsite clinical pharmacists. The program includes 3 visits lasting 30 to 60 min 6 to 8 weeks apart. The CAEMP addressed all of the National Asthma Control Initiative's Guidelines Implementation Panel priority messages and included: education on pathophysiology and roles of medications; identifying triggers and comorbidities; controlling environmental triggers; assessing asthma severity and control; demonstrating inhaler technique and inspiratory flow; provision of PEF meters, spacers, and nebulizers if needed; identifying a PEF personal best; developing asthma action plans; referrals for tobacco cessation counseling; and provision of influenza and pneumococcal vaccinations.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Percentage of referred patients who completed CAEMP visits Change in ACT (asthma control test) before and after education. (A score of <20 indicates poor asthma control.) Receipt of influenza and pneumococcal vaccination Identification of common errors in inhaler use

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Between 12/19/14 and 10/17/16, 45 patients were referred to the CAEMP. Twenty-six patients (57%) attended at least one visit. Eighteen (69%) attended one visit, and only 2 patients completed the full 3 visits. ACT scores at referral of the two groups were similar (mean of 14.75 in the visit group, 15.26 in the non-visit group, NS). Only 3 patients in the non-visit group had a follow up ACT score compared with 15 patients in the visit group (follow-up ACT mean of 17, an increase of 3, $p = 0.1$). Influenza vaccination (2015–16 season): 17 patients in the visit group (65%) and 10 (52%) in the non-visit group. Pneumococcal vaccination: 20 patients (77%) in the visit group and 15 (79%) in the non-visit group. Eighteen of the 26 patients (69%) who had asthma teaching visits had errors with inhaler use. The most common errors: inhaling too fast and failing to actuate the inhaler.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Referral of patients with uncontrolled asthma to pharmacist-led sessions for education and management identified frequent errors in medication usage, and suggest a trend toward improvement in asthma control after. However, uptake was low and very few patients were willing to attend more than one session. When possible, a "warm handoff" between clinician and educator may result in increased patient uptake.

IMPLEMENTATION OF AN ACADEMIC CLINICAL PARTNERSHIP WITH THE INDIAN HEALTH SERVICE Matthew Tobey; Tom Peteet; Devin Oller; Omar Amir; Katrina Armstrong. Massachusetts General Hospital, Somerville, MA. (Control ID #2705547)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Many rural American Indian communities experience severe health disparities and strained health systems; however, few academic health centers provide clinicians to staff Indian Health Service sites.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Chronic understaffing and administrative lapses of Indian Health Service (IHS) sites in the Northern Plains has been the subject of multiple Congressional inquiries. A year ago, a failed Center for Medicare and Medicaid Services (CMS) survey of the sites led to temporary decommissioning of departments at several IHS sites. Therefore, 1) Using the clinical resources of an academic health center, we sought to create a sustainable, long-distance clinical partnership at an IHS site to stabilize care systems. 2) Given the challenges to care delivery within such an IHS site, few innovative or community-based services exist; we sought to facilitate such programs.
DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): To help meet the needs of an understaffed Indian Health Service site, we have developed a full-time rotating clinical position with academic internists at a rural IHS hospital and clinic. To our knowledge, this constitutes the first such partnership in the United States. Early partnership goals have included effectively sharing a patient panel, enhancing inpatient and outpatient care services at the site, engaging with the community, and participating in efforts to cultivate links between federally-managed care and community initiatives. Our program's providers serve in two-week rotations. One of four academic clinicians is present at all times.
MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1. Faculty review of the program with qualitative surveys is planned semiannually for the first three years of the partnership. 2. The primary measure of success - per the community - will consist of a stable clinical presence at the site. Missed days or rotations will be reviewed in detail. 3. Qualitative community and patient input is sought monthly as part of monitoring and evaluation
FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We have successfully established a 365 day/year academic partnership at a challenged IHS site. In the initial phase of implementation we have: −Developed a high-risk patient care system -Streamlined shared clinical responsibilities -Learned lessons regarding clinical process improvement, as below -Learned lessons regarding community engagement, as below
KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Category A: IHS-based care 1. Shared panel management is possible with a complex care list, shared notifications, shared notes, and weekly 30-min calls 2. Chronic understaffing of administrative and support positions can limit clinic system redesign 3. Our team have thus far made fewer requests for telemedicine and tele-specialty consultation than anticipated Category B: Community-based care: 1. Clinical work at community activities (basketball games, traditional ceremonies) serves as a helpful scaffold for community partnership 2. Effective clinical care helps develop a positive reputation in the community 3. Productive communication with both IHS and community leaders is possible even in times of relative disagreement between them

IMPLEMENTATION OF DIABETIC RETINAL SCREENINGS AT PRIMARY CARE TRIAGE IMPROVES ACCESS TO CARE WITH MINIMAL BURDEN TO THE PCP Stacie Schmidt; Jada C. Bussey-Jones; Lesley Miller. Emory University, Atlanta, GA. (Control ID #2671834)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can diabetic retinal screening exams be implemented in Primary Care with minimal impact to clinic flow and physician workload?
OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): We aimed to establish diabetic retinal photo services within the Primary Care Center which could: 1. Identify patients eligible for annual diabetic retinal screening exams through the use of Best Practice Advisories (BPAs) 2. Provide easy-to-administer annual diabetic retinal screening exams within our Primary Care Center, with minimal impact to clinic flow or physician workload
DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Diabetes is the leading cause of preventable blindness in the United States. Approximately 30% of patients with diabetes have diabetic retinopathy. Despite this knowledge, national diabetic retinal screening rates are currently less than 40%. This is partly related to the fact that annual diabetic eye exams require patients to schedule separate eye appointments rinvolving travel to specialty clinics outside of the primary care office. To overcome these barriers, our clinic partnered with Intelligent Retinal Imaging Systems (IRIS) to provide simple, automated diabetic retinal photos within the Primary Care Center. Screenings by CMAs at triage involve use of an automated fundus camera requiring minimal manipulation, and take less than 5 min to complete. Photo images were uploaded and interpreted offsite by a trained retinal specialist; written diagnoses and recommendations for follow-up were communicated to the ordering provider (via the electronic health record) within 24 hours of image capture.
MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Reports are run on a weekly basis to determine the number of patients being screened, the percentage of pathology identified, and the number of non-readable images. Future reports will determine how well patients are appropariately scheduled for follow-up in the eye clinic, after receiving abnormal results.
FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Implementation of diabetic retinal eye exams can occur within the primary care setting with minimal burden to physicians, particularly if clinical staff can be identified as champions of implementation. By allowing our CMAs to "own" the process (including administering the test, reviewing written results and establishing follow-up visits accordingly) we created a protocolized process that distributed work to non-physician clinical staff. Of the 625 patients already examined within the Grady Primary Care Center over the first two months of implementation, 2.4% were diagnosed with Proliferative Diabetic Retinopathy (PDR). The significance of this number is that the average incidence of PDR of all IRIS programs implemented over the last year is 1.3%. We suspect this discrepancy is due to the unique population we serve—which are largely uninsured and of low health literacy—and who often have limited access to the health care system.
KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Diabetic retinal screening photos can be implemented within primary care, with minimal burden to physicians. It also offers a unique opportunity to study the patient experience after receiving screenings in this setting.

IMPLEMENTATION OF OPEN-ACCESS SCHEDULING IN A PRIMARY CARE PRACTICE

Rui Jiang[1]; Anoop Raman[2]; Lindsay E. Jubelt[1]. [1]Icahn School of Medicine at Mount Sinai, New York, NY; [2]Mount Sinai Health System, New York, NY. (Control ID #2707517)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): In primary care, traditional scheduling may be associated with practice inefficiency, including a high no show rate and long wait times for appointment availability, which calls for a need for a different kind of scheduling practice.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Open access scheduling, a model that allows patients to schedule non-emergent appointments on the same day, may improve (1) patient access to care, (2) practice efficiency, and 3) provider, staff, and patient satisfaction.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The study environment was a union-sponsored primary care clinic in Atlantic City, New Jersey. The intervention was a new scheduling model that reserved 70-80% of visit slots to be used for same day appointments while allowing 20-30% of visit slots to be booked in advance. With the new open access model, patients were required to make appointments the day prior to or the day of their appointment request, unless they had any of the following: 1) language difficulties; 2) transportation difficulties; 3) recent hospital discharge; 4) provider requested. There were 3 time periods for transitioning to open-access scheduling: pre-implementation (May to September 2016), implementation period (October to November 2016), and post-implementation (December 2017 and beyond).

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Access to primary care was measured by time in days until next available appointment and the percent of walk-in patients accommodated the same day. Practice efficiency was measured by number of visits per provider-day and percentage of no show visits per month. Patient satisfaction was evaluated via a survey. Provider and staff perceptions of open access were evaluated by semi-structured interviews.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Since implementation, there was a decrease in time to next available appointment from 6.37 days to 0.33 days in the implementation period. The percentage of walk-in patients accommodated increased from 93 to 96%. Though final data is pending, available data shows the total number of visits per provider-day decreased from an average of 13.6 pre implementation to 11.1 during implementation. The no-show rates for scheduled visits decreased from 20 to 15% during implementation. In the patient satisfaction survey post-implementation, 96% of patients indicated that they would "definitely" (most favorable response) refer their family/friends to the clinic. Data is pending on provider and staff satisfaction.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Open access scheduling successfully improved patient access and practice efficiency. Patient satisfaction was high post- implementation. The number of visits per provider day decreased, which may also indicate improved clinic efficiency via reducing unnecessary visits. Our data suggest that open access can be implemented in a short time period and leads to positive outcomes for a primary care practice and its patients.

IMPLEMENTATION OF SCREENING AND INTERVENTIONS FOR UNHEALTHY ALCOHOL USE IN AN ACADEMIC GENERAL INTERNAL MEDICINE PRACTICE UTILIZING ELECTRONIC HEALTH RECORD TOOLS

Daniel Jonas1, 1; Colleen Barclay[1]; Bailey Minish[1]; Tamrah J. Watson[2]; Julia G. George[1]; Scott W. Rose[1]; Nancy M. McElveen[1]; eve webster[2]; Shana Ratner[1]. [1]University of North Carolina at Chapel Hill, Chapel Hill, NC; [2]UNC Health Care, Chapel Hill, NC. (Control ID #2706587)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): After implementing a new electronic health record (EHR), our general internal medicine resident and faculty practice did not have a system to screen for unhealthy alcohol use despite national recommendations to do so.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): We aimed to (1) implement and test an evidence-based, systematic approach to screening, (2) train resident and faculty providers in evidence-based screening and counseling for unhealthy alcohol use, and (3) build tools within our EHR to facilitate screening, delivery of appropriate interventions, and referrals.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Beginning in July 2016, our multidisciplinary quality improvement team including faculty and resident providers, nurses, a patient representative, and a social worker developed standard work protocols for screening and appropriate interventions in our outpatient academic general internal medicine clinic. We used small tests of change to refine the processes and content, and to inform the development of tools in our EHR. We used the single alcohol screening question followed by the Alcohol Use Disorders Identification Test (AUDIT) for those with positive initial screens. Providers received training on (1) recognizing when patients have alcohol use disorder (AUD) versus risky drinking without AUD, (2) delivering behavioral counseling, and (3) accessing and using resources for referral and treatment for patients with AUD. We developed visit-based reminders, tracking systems, and EHR documentation tools to facilitate screening, appropriate interventions, and referrals, aligning processes with those used in our clinic for depression screening and treatment.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Our main outcome is the number (proportion) of patients screened. Other outcomes include the proportion of those with positive screens who complete the AUDIT, documentation of whether patients with positive screens have AUD, documentation of appropriate counseling, documentation of appropriate referral or treatment for AUD, and nurse and provider satisfaction.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Nurses have screened 1,348 (11%) patients over the first 5 months as we expanded to include all providers and nurses. After development of initial EHR tools, 1-on-1 and group trainings, and incentives, about 70% of eligible patients are being screened each week. Of the patients screened, 119 (9%) screened positive; 98 (82%) of those with positive screens

completed the AUDIT and 2 (2%) likely have AUD. The rate of documentation of appropriate counseling has been relatively low (29%).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): EHR tools can facilitate implementation of screening for unhealthy alcohol use. A multidisciplinary team effort, training of providers and staff, and formal systems and support tools were required. Competing demands may limit optimal delivery of appropriate counseling and other interventions; focus on mitigating obstacles may be needed.

IMPLEMENTING A COMBINED WORKFLOW-INFORMATICS SYSTEM FOR THE MANAGEMENT OF PATIENTS ON CHRONIC OPIOIDS AT A LARGE ACADEMIC PRIMARY CARE PRACTICE

Alev Atalay[3]; Rose M. Kakoza[2]; Adrian Zai[4, 5]; Patrick R. Cronin[4]; Lori W. Tishler[1]. [1]Brigham and Women, Boston, MA; [2]Brigham and Women's Hospital, Boston, MA; [3]Brigham and Women's Hospital, Jamaica Plain, MA; [4]Massachusetts General Hospital, Boston, MA; [5]SRG Technology, Boston, MA. (Control ID #2705098)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): With increasing rates of opioid addiction and opioid-related deaths, primary care clinics need to identify, risk stratify and monitor their patients on chronic opioids to develop a systematic approach, based on CDC guidelines, to safely manage their opioid prescriptions.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. To develop an electronic registry of patients on chronic opioids. 2. To establish safe opioid prescribing guidelines based on the 2016 CDC Guidelines. 3. To improve opioid prescribing practices by integrating the registry to the practice's clinical workflow.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We developed an electronic registry (TopCare) to identify and track patients on chronic opioids at our academic practice consisting of 45 attendings and 64 resident primary care physicians (PCPs). The registry lists: patient name, name of the opioid prescribed, its morphine equivalent daily dose (MEDD), risk stratification, concurrent benzodiazepine use, prescriptions for intranasal naloxone, next opioid prescription refill date, past and future visit dates with their PCP and other providers at the practice, and date of the most recent urine drug test (UDT). Using the registry, we developed new clinical workflows that include proactive opioid refills and routine urine drug toxicology screening. Additional workflows in development include scheduling follow-up visits and systematic prescribing of naloxone.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Success of the opioid registry is defined by the ability of the registry to accurately identify patients on chronic opioids and to use the registry to monitor and improve safe opioid prescribing practices. Safe opioid prescribing was defined by rates of UDT testing within the last year, PCP visits every 3 months, naloxone prescriptions for patients on a MEDD $\geq$ 50 mg/day, and risk stratification of patients by their PCPs.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We improved our opioid patient identification algorithm significantly over several iterations (True Positive from .23 to 1.0). Over the past 6 months, we improved UDT rates from 20 to 58%. Additional workflows are still in development. Currently, less than 1 percent of patients on a MEDD >= 50% have an active naloxone prescription. The percentage of patients with appropriate PCP follow up has fallen from 40 to 10%. Only 14% of patients have a risk assessment documented in the registry.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): In the wake of the opioid epidemic, PCPs need to address the needs of their patients on chronic opioids. Based on our experience, few patients met safe prescribing goals. We believe that our combined workflow-informatics intervention can successfully improve the efficacy of opioid management and that the following lessons are keys to its success: (1) identify current workflow problems before suggesting an overall approach that includes an informatics solution, (2) request that all stakeholders be involved with the design team, (3) determine how and if physicians need to be part of the workflow, and (4) aligning user interface design with clinical workflow, and (5) continuously track outcomes of our intervention.

IMPLEMENTING OPIOID EDUCATION AND NALOXONE DISTRIBUTION (OEND) IN A VA PRIMARY CARE PRACTICE

Leif Petterson[4]; Anna L. Dill[1, 4]; Jonathan N. Pumilia[2]; Leila Haghighat[1, 4]; Benjamin Lu[1, 4]; Stephanie Leung[4]; Cory Curley[4]; Susan Langerman[4]; Danielle Wojtaszek[4]; Brent A. Moore[3]; Kathleen White[4]. [1]Yale Internal Medicine-Primary Care, New Haven, CT; [2]Yale-New Haven Hospital, New Haven, CT; [3]Yale University School of Medicine, New Haven, CT; [4]VA Connecitcut Healthcare System, West Haven, CT. (Control ID #2707570)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): VA has created OEND (Opioid Education and Naloxone Distribution) to educate providers on the indications for and availability of naloxone for high-risk opioid users, but has not established a means for local care teams to identify eligible patients and distribute this potentially lifesaving medication.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To educate providers and support staff on the indications for and availability of naloxone for high-risk opioid users To monitor naloxone prescription receipt and to identify patients in need of outreach To create a system where individual care teams perform their own outreach and education

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Using the "Primary Care Almanac" on CPRS, we generated lists of high-risk patients (defined as those receiving >90 milliequivalents of morphine every 28 days) for each individual PACT team. Each care team underwent a 30-min seminar designed by a multi-disciplinary team on the epidemiology of opioid abuse and misuse, the safety and efficacy of naloxone, and how to train eligible patients. After this training, each care team received a list of patients on their panel who were identified as appropriate for naloxone; were ready to perform outreach to eligible patients. Patients can be educated on proper naloxone use by an RN or a provider; and clinic staff can provide training the same day the prescription is written. Monthly lists will be generated and distributed to the individual PACT teams, which will serve as a list of patients who need to be contacted and as a report card on their team's success over the past 30 days. A focus-group will be

conducted at 90 days with the entire primary care practice to assess challenges faced and successess achieved by individual care teams.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Intervention success will be evaluated based on the percentage of eligible patients who have received the medication and appropriate education, as well as reduction in the total number of patients who receive >90 milliequivalents of morphine each month. The focus-group will provide a forum for participating providers and support staff to discuss challenges they have faced in outreach and implementation, and to generate solutions based on their collective experience.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Findings will be discussed once further data has been collected and the focus-group has been held.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our intervention demonstrates that implementing national directives on the local, practice level can be achieved by utilizing panel management to identify target patients, and generating “report cards” for individual providers to monitor their progress at enrolling their own patients. Centralized data generation and regular feedback in the form of the report cards provides an objective measure of team’s performance, while encouraging individual care teams to determine the best way to engage their patients allows for a personalized and flexible approach.

IMPLEMENTING PERSONAL HEALTH PLANNING IN VA: RESULTS OF A QUALITATIVE, MULTISITE EVALUATION

Gemmae Fix[1]; Rendelle Bolton[2]; Timothy P. Hogan[4]; Tana Luger[6]; Anna M. Barker[5]; Donald Miller[3]; Mollie A. Ruben[3]; Barbara Bokhour[5]. [1]Center for Healthcare Organization and Implementation Research/Boston University School of Public Health, Bedford, MA; [2]Edith Nourse Rogers Memorial VA Hospital, Bedford, MA; [3]US Department of Veterans Affairs, Boston, MA; [4]United States Department of Veterans Affairs, Bedford, MA; [5]Veterans Health Administration, Bedford, MA; [6]Pitzer, California, CA. (Control ID #2705885)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Healthcare has typically been disease focused. There is increasing demand for patient-centered care (PCC). The Department of Veteran Health Affairs (VHA) is implementing an innovative approach to establishing PCC, through focusing clinical encounters on developing shared goals, using goals using Personal Health Planning (PHP). We sought to understand how VHAs are implementing the PHP & the impact of PHP on patients.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Use PHP to align care with patient goals.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The PHP consists of a series of questions designed to identify “what really matters” to the patient. It includes eight realms of patients’ lives: food and drink, working the body and personal development This process allows patients and providers to collaborate on goal identification and create a plan based on patients’ values and preferences.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We conducted a mixed methods evaluation of PHP across 10 VHA facilities. We examined qualitatively through interviews and observations: 1) how facilities implemented PHP; 2) keys to successful implementation; 3) alignment of the process with key principles of PCC. Qualitative data were analyzed using an iterative approach combining emergent & a priori coding procedures based on VHA’s PHP program & PCC theories. We collected mailed surveys ($N = 418$ patients) at 2 sites, including patient reported outcomes (experiences of care, self-reported health status, self-efficacy and activation).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The 10 facilities used a variety of approaches to structure their PHP program, centering on: a) location, b) patients targeted, & c) staff responsible. From the site visits, we identified 5 practices critical to PHP implementation. 1) Developing a local vision, including facility-level strategic planning & self-reflection. 2) Defining roles & communication practices across the team. 3) Creating infrastructure to support the PHP process. 4) Iterative rounds of piloting to incorporate staff, provider and patient needs. 5) Fostering an organizational climate that supports PHP, such as identifying and supporting PCC champions. Presently, these programs only partially met PCC principles. While PHP fostered some practices aligned with PCC, patients’ life context, values & preferences were not shared across the team or always evident in the resulting plan. From the surveys we found significant correlations between experiencing a PHP & all patient reported outcomes (p ranged from $< .001$ to $< .05$)

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our mixed-methods evaluation found PHP may be effective for improving patient-reported outcomes. However, facilities need to use concurrent, multilevel strategies to implement a complex PCC initiative, like PHP. Piecemeal implementation resulted in care practices which fell short of PCC. As healthcare systems embark on PCC, implementing programs such as PHP can facilitate a shift toward PCC practice. Having staff dedicated to PCC is necessary, but insufficient to affect these changes. PCC implementation must engage all stakeholders and be evident across all team members.

IMPROVING CONTINUITY OF CARE: A BUILDING BLOCK FOR HIGH-FUNCTIONING PRIMARY CARE RESIDENCY CLINICS

Roberto O. Diaz Del Carpio. University at Buffalo, Buffalo, NY. (Control ID #2701048)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): There was no continuity of care in our primary care residency clinic.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. To increase patient and resident perceived continuity of care by 80% in our primary care residency clinic by June 2017. 2. To increase patient and resident satisfaction with continuity of care by 80% in our primary care residency clinic by June 2017.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Our outpatient center has 5 FTE internal medicine attending physicians, 1 nurse practitioner and 31 internal medicine residents. Residents are scheduled to see patients every five weeks as part of our 4 + 1 schedule. The continuity of care among residents and attendings was on average 30 and 80% respectively. In our center,

multiple attempts have been made to increase continuity, most of them at a policy level. We used the model for improvement from the Institute of healthcare Improvement and received mentorship from the Centre for Quality Improvement and Patient Safety from the University of Toronto. Based in our root cause analysis, our first intervention targeted human factors and infrastructure. Our EHR team simplified the discharge template and provided discharge process training to all our providers. Our infrastructure problem was related to the lack of an adequate scheduling software. After a structured interview with our front desk office team we decided to change our residents schedule from individual to a block schedule to facilitate patient appointments. Subsequent interventions have focused on simplification and standardization of the resident block schedule by empaneling patients and consolidating didactic teaching activities. Audit and feedback to/from residents, front desk staff and attendings continue to help redesigning our block schedule. We reviewed data in a weekly basis. Data was analyzed using QI Macros 2015.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Process measures: 1. Percentage of correct discharge order sets completed by providers 2. Percentage of follow up appointments correctly scheduled by front desk staff Outcomes measures: 3. Percentage of patients scheduled for a follow up visit that were seen by the same provider 4. Patient/resident satisfaction Balancing measures 5. Patient volume 6. No-show rate

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): By December 2016: 1. 97% of discharge order sets were completed correctly by residents. 2. 90% of follow up appointment were correclty scheduled by front desk staff 3. Continuity of care increased to 80% among residents' patients 4. Patient satisfaction with continuity incrased by 20%. Resident satisfaction increased by 50% 5. Patient volume increased by 20% among residents. 6. Patient no-show rate remained the same: 20%

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Continuity of care is among the building blocks of a high-functioning primary care residency clinic. Our continuity of care has improved as well as our provider and patient satisfaction. Using rigorous QI methodology, engaging key stakeholders and having data readily available have helped us to overcome barriers. Our residents have ranked our clinical learning environment among the best training locations in our program.

IMPROVING HANDOFFS FROM ACUTE TO SUB-ACUTE CARE: A VA INTERDISCIPLINARY HFMEA QUALITY IMPROVEMENT PROJECT Amy W. Baughman[2]; Barbara Shahood[2]; Lakshmana Swamy[2]; Marcus D. Ruopp[2]; Christopher Worsham[2]; Patricia Soonthornprapuet[2]; Frederick Pasche[2]; Denice Mitchell[2]; Manuela Ferreira[2]; Shivani Jindal[2]; Sandra Vilbrun-Bruno[2]; Matthew Ronan[1]; Caitlin Oliveira[2]; Steven R. Simon[2]. [1]VA Boston, Brockton, MA; [2]VA Boston Healthcare System, Boston, MA. (Control ID #2703158)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Communication has been cited as the most common root cause in sentinel events, with failed patient care handoffs contributing to an estimated 80% of serious preventable adverse events; handoffs to sub-acute care such as nursing homes are at particularly high risk for communication breakdown given high patient complexity and comorbidity.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Improve the handoff process from an acute inpatient hospital to a sub-acute care facility by: 1) Standardizing verbal handoff content and usage 2) Simplifying communication modes 3) Decreasing inappropriate transfers and delays in care (transfer time, discharge summary completion)

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Background: Our healthcare system includes a 400-bed acute care hospital and 112-bed sub-acute care facility. Handoff processes were highly variable in quality, format and completion. Communication about travel and team/unit assignment was chaotic, involving multiple providers, social workers, nurses, and unit secretaries. Observational data from June 2014 - April 2015 showed for 159 transfers, handoff was absent for 29 transfers (18%). Intervention: In conjunction with Patient Safety leadership, we conducted a Healthcare Failure Modes Effects Analysis (HFMEA) from March-October 2016. Strategy: 1) Establish Interdisciplinary Team: hospital and subacute care providers, nurses, social workers, and unit secretaries. 2) Define goals, outcomes, and a data collection system 3) Create detailed process-maps 4) Conduct Failure Modes Analysis to identify failures 5) Construct Hazard Analysis to prioritize failures based on severity and probability 6) Action Plans for high scoring failures: ■ Standard Operating Procedures (SOP) for transfer notification and cancellations ■ Standardize verbal handoff content for providers (I-PASS [I: Illness severity; P: Patient summary; A: Action items; S: Situation awareness and contingency planning; S: Synthesis by receiver]) ■ Retrain administrative staff on travel processes

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Seven measures were tracked daily from April-October 2016 (interventions began June 2016).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Completion of provider verbal handoff improved from 80 to 100%. I-PASS usage, which was started in July, improved from 11% to 82%. Discharge documentation was high at baseline (93-96%) and remained at 95%. Nursing verbal handoffs also were high at baseline (93-100%) and remained at 100%. There were only 2 inappropriate transfers, 1 in the baseline period and 1 in the intervention period. Transfers with "unfinished business" decreased from 10% to zero in the last two months. Transfers with adverse events or delays in care decreased from 13% to zero.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The HFMEA process improved several hand-off process measures for acute to sub-acute care transfers. Key features were sound data collection, collaboration with Patient Safety, and having an interdisciplinary team from both acute and sub-acute care. A systematic process was essential: process maps to evaluate processes and failures, analysis to prioritize failures, and action plans to develop interventions.

IMPROVING INTERN EFFICIENCY USING THE ELECTRONIC MEDICAL RECORD AT A VA INTERNAL MEDICINE CLINIC Ruth Fernandez Ruiz; Susan Slycord; Maria Story. University of Iowa Hospitals and Clinics and Iowa City VA Medical Center, Iowa City, IA. (Control ID #2702242)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Learning to successfully navigate the electronic medical record utilized by the Veterans Affairs (VA) Health Care system, the Computerized Patient Records System (CPRS), can be challenging for interns starting their clinics at the Iowa City VA Medical Center. A more practical guide is necessary to help residents increase their efficiency.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Identify barriers residents face learning how to navigate CPRS in clinic, and assess their baseline level of efficiency Design a pocket guide, focused on the areas where residents performed poorly Compare the efficiency and performance on common clinic topics between the residents that underwent regular orientation and the ones that also received the new pocket guide.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Attending staff from the VA outpatient clinic were interviewed to identify frequently asked questions and common problems interns face when beginning to work in the clinic. Ten residents rotating at the same-day scheduling clinic without prior experience in the VA outpatient setting were surveyed to assess level of comfort completing specific tasks in clinic, the time required to complete these tasks, and their overall feeling of efficiency. Based on faculty interviews and resident surveys, we created a booklet containing details on how to complete tasks commonly encountered in clinic. Another survey was performed 5 months after distribution of the manual to new interns (91% responded).

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We compared the results obtained from the groups of residents before and after the distribution of the pocket guide. The efficiency means were calculated in both groups, as well as the percentage of change. For questions dedicated to assess knowledge, we obtained the percentage of correct responses. The group who had access to the pocket guide was asked to evaluate the usefulness of this manual and to provide additional comments for improvement.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Since July 2016, 80% of the interns ($n = 10$) have read the manual at least once and the average rating of usefulness was 6 (range from 4–8) on a scale of 1–10. Objective evaluation on how to resolve a clinical reminder improved from 30% to 70% after implementation of the manual. Subjectively, level of comfort managing clinical reminders also improved 42%, from a mean of 4.5 to 6.4 (on a scale from 1–10, with 1 being very uncomfortable and 10 completely comfortable). Self-rated efficiency of residents improved 16%, from a mean of 4.3 to 5.0. The most common request for improvement from survey respondents was the need for development of an electronic version of the manual.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The orientation interns receive prior to beginning work at their VA clinics has several areas for improvement. We have identified many of these by conducting a brief survey. The creation of a tool aimed to improve physician comfort and efficiency using CPRS in the form of a pocket guide was shown to be successful, however, further work remains. We expect to continue to improve the resident's manual, taking into consideration input from the users.

IMPROVING MEANINGFUL USE OF PATIENT PORTALS IN AN ACADEMIC SAFETY-NET CLINIC

Elaine C. Khoong[2]; Natalie Combs[2]; Malia Honda[2]; Samuel Miller[2]; Lisa Ochoa-Frongia[1]; Shobha Sadasivaiah[2]; Courtney R. Lyles[3]. [1]University Of California San Francisco, San Francisco, CA; [2]University of California - San Francisco, San Francisco, CA; [3]University of California San Francisco, San Francisco, CA. (Control ID #2706935)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Patient portal enrollment and use in safety-net clinics lags behind other healthcare settings.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Increase enrollment and use of a patient portal in a safety-net clinic 2. Ascertain provider and patient-level barriers to patient portal use

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): This was a resident-led quality improvement effort at a single academic safety-net general medicine clinic staffed by resident and attending physicians as well as nurse practitioners. Our clinic serves only patients who are uninsured or have Medicare and/or Medicaid. Half our patients have limited English proficiency. We used a multi-faceted approach targeting providers and patients to increase patient portal enrollment and use. In early 2016, the research team conducted provider education sessions focused on portal functions and how to offer patients portal access. In spring 2016, a volunteer approached patients in the waiting room to enroll patients in the portal; in winter 2016, the volunteer began contacting web-enabled patients to arrange in-person training for portal use.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Two primary outcomes are based on previously defined Meaningful Use (MU) metrics: a) offering patients portal access (i.e. "web-enabling"); b) portal use after enrollment. Secondary outcomes included: c) provider self-rated knowledge about the portal; and d) patient reasons for declining enrollment or not using the portal.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Data in the 4th quarter of 2015 (baseline) showed 38% (1586/4190) of patient encounters were with a web-enabled patient. In the first six months of 2016 this improved to 50% (3554/7083). While the majority of patients were offered portal access, patient use of the portal website once enrolled did not improve. At baseline, 1.8% (56/3082) of encounters were with patients who had used the portal, but in the first half of 2016, this rate was similar (119/7083 = 1.7%). Analyses of these metrics will continue as data become available. Provider self-assessments ($n = 59$ at baseline; $n = 40$ at follow-up) about the portal improved: a) self-reported confidence in ability to describe the portal to patients from 25 to 63%; b) self-reported knowledge about web-enablement from 29 to 60%. Most patients (720/978 = 82%) approached in the waiting room declined enrollment. Common reasons for declining were language barrier (25%), lack of computer/Internet access (22%), and poor computer skills (19%). When web-enabled patient were contacted to arrange in-person trainings, the majority (66/99 = 67%) were interested in training but a large portion were unaware they had portal access (25/99 = 25%).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Major barriers exist to enrolling and engaging vulnerable – particularly limited English proficient and technologically illiterate – patients in online portal use. Education and workflow improvements increase provider knowledge and skills but have limited impact on sustained patient use of portals. Safety net settings need more support to address the hurdles that prevent underserved patients from using portal websites for healthcare management.

IMPROVING MEDICATION RECONCILIATION IN A VA NURSING HOME AS PART OF MARQUIS2 Amy W. Baughman[2]; Nicole Murphy[2]; Laura Driscoll[2]; Caitlin Moses[2]; Jeni Norstrom[2]; Rajani Balasubramaniam[2]; Kathryn Lange[2]; Adam Woolley[2]; Sandra Vilbrun-Bruno[2]; Nancy Connors[2]; Wei Shen[2]; Amy Hanson[2]; Marcus D. Ruopp[2]; Shivani Jindal[2]; Barbara Shahood[2]; Gilda Cain[2]; Tosha B. Wetterneck[1]; Amanda S. Mixon[3]; Steven R. Simon[2]. [1]University of Wisconsin School of Medicine and Public Health, Madison, WI; [2]VA Boston Healthcare System, Boston, MA; [3]VA Tennessee Valley Healthcare System and Vanderbilt University, Nashville, TN. (Control ID #2706413)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Accurate, efficient medication reconciliation (med rec) is a known safety concern for healthcare professionals caring for patients with polypharmacy, multimorbidity, and cognitive impairment.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Improve med rec by implementing best practices in a nursing home. 2. Evaluate a novel software tool. 3. Improve clinician experience.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Setting: VA Boston's Community Living Center (Brockton, MA) is a 110-bed nursing home that provides transitional (skilled or rehabilitation), palliative/hospice and long-term care. Patients are medically complex and often have limited medication knowledge. The interdisciplinary quality improvement (QI) team includes pharmacists, nurses, physicians, nurse practitioners, physician assistants, information technologists and QI experts. Intervention: This study will span October 2016 - June 2018 as part of MARQUIS2 (Multi-Center Medication Reconciliation Quality Improvement Study 2). Baseline assessments included policy review, completion of a provider survey, and process mapping of all current med rec processes. In the next phase, we will implement interventions based on identified challenges and established best practices. These include pharmacist-driven intensive med rec for high-risk patients and the Avicenna MedRec Tool, proprietary software to overcome existing barriers in our current electronic medical record.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Primary outcome: unintentional medication discrepancies, tracked from a random sample of 22 patients per month by study pharmacists. We will also evaluate clinician satisfaction with med rec processes as we test various interventions.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): In our baseline survey, 11 providers (response rate 100%) reported spending approximately 30 min on each admission and discharge reconciliation, identifying 2.7 errors per patient. Most (7/11) lacked confidence in the accuracy of the med rec process. Yet the majority identified med rec as important. Few received formal education (2/11), incentives (1/11) or resources (2/11) to address medication discrepancies. After 5 weeks of discrepancy data collection, 24 patients have been reviewed. 13 patients were found to have unintentional discrepancies on admission. For the 8 patients discharged to date, 2 unintentional discrepancies were found at discharge. There have been 29 discrepancies total; of these, 23 were due to history errors and 6 were due to reconciliation errors.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): ■ Nursing homes represent a critical setting for medication reconciliation efforts due to the often challenging but clinically important determination of medication lists. ■ Medication reconciliation is time consuming and error-prone in the current state. ■ Stakeholder surveys and process maps will inform targeted interventions by providing detailed information on work flow and practice variation.

IMPROVING OSA SCREENING IN HYPERTENSIVE PATIENTS USING THE STOP-BANG QUESTIONNAIRE IN PRIMARY CARE CLINIC: QUALITY IMPROVEMENT PROJECT Musa Saeed[1]; Mansi Nigam[1]; Amita Krishnan[1]; Marwan Saoud[1]; Smita Y. Bakhai[2]. [1]SUNY University at Buffalo, Amherst, NY; [2]SUNY at BUffalo, Williamsville, NY. (Control ID #2691242)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Obstructive sleep apnea (OSA) is more prevalent in patients with Hypertension (HTN), while it is associated with morbidities such as stroke, heart failure and premature death, it remains underdiagnosed.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The purpose of this project is to increase the use of the STOP-BANG questionnaire by 10% from baseline in hypertensive patients between the ages of 18–75 over 6 months.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We used Plan Do Study Act (PDSA) model and root cause analysis using fish-bone diagram in a group discussion with preceptors and residents to identify system, provider and patient barriers. System barriers were identified as lack of electronic database, documentation and unavailability of STOP-BANG questionnaire in the EMR. Provider barriers were lack of knowledge about relationship between HTN and OSA, lack of reminders and extra time spent during the visit to use the questionnaire. Patient barriers were identified as lack of knowledge about OSA and procedure of sleep study as well as cost or insurance coverage. Electronic patient registry was created in collaboration with the Information Technology Department using Allscript (EMR). Customized workflow was created in the EMR to remind and document STOP-BANG questionnaire. A presentation on OSA and discussions about EMR workflow for documentation was reviewed with all the 40 residents in our Internal Medicine Clinic at ECMC. Nurses were educated about STOP-BANG questionnaire and paper format of the questionnaire was given to the patients while checking them in the examination room. Time spent during visits on questionnaire leading to backlog of patients waiting in the clinic was determined to be the balance measure.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Outcome measure was identified as number of patients with HTN screened for OSA and number of Sleep Studies ordered for all those screened as high risk for OSA. Data analysis was performed using monthly run charts.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Prior to initiation of this project, less than 1% of hypertensive patients were screened for OSA using the STOP-BANG questionnaire. After physician education was introduced, screening rates increased to 3.92% in the month of September. After nursing education and administration of paper-formatted questionnaires to the patients were done, screening rates increased to 9.23% in the month of November. The extra time used on the screening tool did not lead to any patient backlog in the clinic.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): STOP-BANG integration in EMR and introduction of a team approach by educating physicians and nursing staff can lead to a dramatic increase in screening for OSA. Cost and lack of insurance coverage for sleep study was identified as a major barrier. Confirmation of OSA after screening will help reiterate the need for OSA Screening with STOP-BANG questionnaire in all patients with HTN.

IMPROVING OUTCOMES IN UNCONTROLLED DIABETICS

oluwatoyin opelami. MetroHealth, Cleveland heights, OH. (Control ID #2706713)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): The aim of the program was to achieve a 20% HbA1c reduction in patients with type 2 diabetes seen at a community primary care practice within a 12 month period, by increasing frequency of office visits, reducing medication titration intervals and scheduling regular diabetic education visits.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Increase patient's adherence to diabetic therapy by reducing the interval for medication titration. Having regular structured patient education.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The study was designed using a population in an outpatient clinic within an urban community with a low household income and low literacy levels as compared to the general population. Frequent clinic visits were scheduled for patients with HbA1C > 9% using a known electronic medical record for sample selection. These visits were held concurrently with both their physician/nurse and a DM educator. Two consecutive weekly visits followed by a fortnight visit and then two consecutive monthly visits were scheduled with the aim of titrating medications to achieve a fasting blood glucose goal between 80–130 mg/dl and 1–2 hours postprandial glucose less than 180 mg/dl. At each initial visit, the patient was educated on the diagnosis of diabetes, possible complications and available treatments, including diet, oral medications and insulin. A blood glucose (BG) meter was prescribed in addition to other materials needed to check BG at home (initially twice daily for people on oral hypoglycemic agents and at least three times daily for people on insulin). Patients with HbA1C > 10 at initiation were started on long acting insulin at bedtime. During that visit, they also met the DM educators to establish a relationship. They were instructed on how to use a meter and administer insulin, if prescribed. They were given a brief overview on the sugar contents of some common meals and some handouts to take home. During the program HbA1c levels were checked at 6 months to evaluate the effectiveness of the current regimen. Patients who were at goal were encouraged to join new group classes while those not at goal had their regimen modified. Group diabetic education classes were organized in an informal setting with the diabetic educator as the facilitator.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): HbA1c was checked at the start of the program, at 6 months and at 12 months.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Twenty eight patients participated in the pilot phase of the program. 54% of participants were females and all were self-identified African-Americans. 64% of program participants were on insulin, either alone or in combination with other agents. Average HbA1c at the start of the program was 10.9. At the end of 6 months, there was a 23% reduction in HbA1c and this was sustained at the end of 12 months.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A cost-analysis is to be carried out following which the program will be extended to other providers within the practice and eventually to providers within the larger health system.

IMPROVING OUTPATIENT FOLLOW-UP WITH PRIMARY CARE PHYSICIANS AFTER AN EMERGENCY DEPARTMENT VISIT

Casey White; Roberto O. Diaz Del Carpio; Pojchawan Yampikulsakul. University at Buffalo State University of New York, Amherst, NY. (Control ID #2707067)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Following an internal chart review, post-Emergency Department (ED) discharge appointment compliance amongst Hertel-Elmwood Internal Medicine Center (HEIMC) patients was found to be suboptimal at only 30%.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To increase by 30% the rate of follow up visits post-ED discharge by March 2017 at HEIMC.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): HEIMC is an academic outpatient clinic, part of the Kaleida Health System (KHS), and is affiliated with the Department of Medicine at the University at Buffalo. HEIMC provides healthcare to a diverse population of patients from various cultural backgrounds and low socioeconomic status. Our center has 5 internal medicine attending physicians, 1 nurse practitioner, and 31 internal medicine residents who rotate in a 4 + 1 schedule. Coordination of care among our inpatient and outpatient centers have become a priority, especially considering our accreditation as a certified level 3 Patient Centered Medical Home (PCMH). Our follow up rates of patients being discharged from KHS EDs were suboptimal. Initial root cause analysis revealed a lack of structured outpatient scheduling at the time of ED discharge, time constraints of providers, and deficiency in communication with patients following discharge as main drivers of suboptimal ED follow up. At the system level, we created a

structured network for patient follow-up. Our designated nurse will contact all patients who were discharged from the ED and direct messages to providers for review and to front desk personnel for making appointments using our designed template.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Process measures: % of HEIMC patients who visited KHS ED and were contacted by our nurse. % of HEIMC patients that are scheduled for follow up appointment. Outcomes measures: The rate of outpatient follow up appointment compliance, including time from the ED visit to office visit. Balancing measures: Number of HEIMC patients that visited the ED Staff/Provider satisfaction

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): As of December 2016, after we started our intervention, All HEIMC patients who were discharged from ED were contacted, 96% of patients were reached by phone call, 67% had been scheduled for follow up. The rate of outpatient follow up appointment compliance to date is 37%, another 30% already have pending appointments.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): As preliminary data has shown thus far, there is an objectively measurable increase in post-ED discharge communication and follow-up through this initiative. As identified through root cause analysis, poor appointment compliance is multifactorial and is recognized by our designated nurse and staff. Our model encourages participation amongst staff members and defines new roles that allow bidirectional contribution to the team. Having a designated nurse contact will help to both screen patients in need of urgent evaluation by physicians, as well as allow for patient education. Since its initiation, this model has been met with an overall increase in appointment compliance and concurrent staff support and satisfaction.

IMPROVING PRIMARY CARE PROVIDER EFFICIENCY IN NEW PATIENT VISITS VIA A NEW PATIENT INTAKE FORM Anne Linker[1]; Charlotte Herring[3]; Vijay Kotecha[1]; Andrew Lau[3]; Satvik Ramakrishna[1]; Lauren Rettberg[3]; Maya H. Dulay[2]. [1]UCSF, San Francisco, CA; [2]UCSF/VA, San Francisco, CA; [3]San Francisco VA Medical Center, San Francisco, CA. (Control ID #2706756)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Our local needs assessment found that primary care providers (PCPs) at the San Francisco VA (SFVA) Medical Practice Clinic frequently judged intake visits to be inefficient, in part due to time spent reviewing each patient's past medical history.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Our objective was to develop an intake form to improve the percentage of providers who find new patient visits "efficient" or "very efficient," from a baseline of 5% to at least 25%, and to decrease overall time spent reviewing a new patient's history during the intake visit.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): SFVA Medical Practice Clinic is an adult primary care clinic serving approximately 9,000 patients from the Northern California area. PCPs include MD/NP trainees and attending providers ($n = 62$). Our quality improvement project was led by an interprofessional trainee team of the SFVA Center of Excellence in Primary Care Education, and was conducted from October 2015 through May 2016. We collected baseline data on new clinic patients seen in October 2015, and on PCP perceptions of intake visits. Patients were willing to complete forms prior to the first clinic visit and most preferred to complete forms in the waiting room instead of at home prior to the visit. We also surveyed PCPs and found that 22% of providers spent more than half of the initial visit on past medical history, and 83% thought an intake form would be helpful. We then designed a new patient intake form and performed three PDSA cycles, gathering feedback from patients and providers at each step.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We evaluated our intervention using patient and PCP surveys with 5 point Likert scales (1 = very inefficient/ dissatisfied, 5 = very efficient/satisfied).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Between the 1st and 3rd PDSA cycles, we found a significant increase in providers' perceived efficiency using the form (3.95 to 4.4 ($p = 0.083$)) and a decrease in time spent reviewing prior history during the visit (2.23 to 1.33 (1 = 10-15min, 2 = 15–20 min, 3 = 20-30min, 4= >30min, $p = 0.004$)). Providers were highly satisfied with the last iteration of the form (4.6 ± 0.5). 30% of clinic providers completed a final electronic survey. Of these providers, 60% found the new patient visits while using the form to be "efficient" or "very efficient". Patients were satisfied with the form (3.7 ± 0.92), and most patients found the form to be an appropriate length (3.0 ± 0.21).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): We successfully developed a clinic intake form that enhanced provider efficiency during new patient visits. Early in our PDSA cycles, the importance of engaging all stakeholders (clinic staff) in a new intervention became clear, and we found greater success when we incorporated feedback on process measures from clinic administrative staff. Frequent introduction of new administrative staff and new providers was also challenging, and we had to include additional training for staff and publicity for the project. We believe that intake tools such as our survey can be used more widely to enhance clinic efficiency.

IMPROVING SAFETY AND APPROPRIATENESS OF PERIPHERALLY INSERTED CENTRAL CATHETERS(PICC): A RESIDENT EDUCATION AND QUALITY IMPROVEMENT INITIATIVE Serena M. Ogunwole[2, 3]; Jack Badawy[1, 2]; Scott DePaul[2, 3]; Kristine Coronado[3]; Robert Quitta[3]; Joshua pozos[2, 3]; Alison Wiseman[2, 3]; Marcos Restrepo[3, 2]. [1]University of texas Southwestern, Dallas, TX; [2]UT health Science Center at San Antonio, San Antonio, TX; [3]South Texas Veterans Health Care System, San Antonio, TX. (Control ID #2707485)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Most Internal medicine residency programs do not offer formal PICC line education for trainees. Because of this lack of knowledge and the prior lack of uniform guidelines, a large number of PICC lines are placed inappropriately. This has led to increased morbidity in patients with PICC lines, increased lengths of stay, failure to meet core measures and increased overall costs for hospitals.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Primary aim: We aim to decrease rate of inappropriate PICC line insertion by 25% at the ALM-VA inpatients in the period of January-February 2017 when compared to Oct2015 to Oct2016. Secondary Aims: We aim to increase the rate of midline catheter use by 25% at the ALM-VA inpatients in the period of January-February 2017 when compared to Oct2015 to Oct2016. We aim to decrease rate of complications of PICC line (CLABSI) insertion by 10% at the ALM-VA inpatients in the period of January-February 2017 when compared to Oct2015 to Oct2016.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): In 2015, an international panel was convened that applied the RAND/UCLA Appropriateness Method to develop criteria for use of PICCs and the Michigan Appropriateness Guide for Intravenous Catheters (MAGIC) were published. Using these guidelines and in consultation with various groups from the hospital (including hospital medicine, nephrology, medical and surgical ICU, nursing, and pharmacy) we have created our own criteria for appropriate IV access. We used these criteria as the basis of the following interventions: Interventions: Changing the electronic medical record consult for IV access to reflect appropriateness criteria defined by our team Resident education in a case based format to introduce appropriate IV access decision making Resident pocket cards will be created that reflect the algorithm for making a decision on the best IV access for individual patient scenarios

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Complication rates of complications of PICC line (CLABSI) Return on investment from increased use of midline and ultrasound gudied peripheral IV

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 1. Resident Survey: understating perceptions and attitudes regarding the use of PICC lines by trainees All residents who identifed as internal medicine residents were asked to partcipate- 60% of residents completed survey Survey includes demographic infomation on all residents including PGY year, plans for future practice(inpatient vs outpatient) 92% of residents have never recieved formal training on indications for PICC line placement, while 100% of them order picc lines for their patients The most common indication for placing picc consults was longterm antibitoics 51% of residents would be interested in formal education regarding indications for PICC line training

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?):.This kind of project will broaden the scope of traditional training by exposing residents to the importance of resources allocation, cost effectiveness, and patient experience. Furthermore it will push trainees to recognize that evidence based medicine is not limited to diagnostic decisions but should be factored into all of the decisions that we make for our patients.

IMPROVING SCREENING FOR WOMEN WITH DISABILITIES

Peter D. Bulova[1]; Stephen Corey[2]. [1]UPMC, Pittsburgh, PA; [2]Magee Hospital, Pittsburgh, PA. (Control ID #2703831)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Does a dedicated center for women with disabilities improve the rates of breast cancer and cervical cancer screening?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Although women with disabilities are living longer, healthier lives, they are less likely than their able counterparts to have basic breast and cervical cancer screening performed. We established a dedicated center to serve women with disabilities with the purpose of providing improved care for this underserved population. 2. We reviewed our patient files to compare the screening rates of breast and cervical cancer in age appropriate patients, compared to national rates of women with disabilities.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The Magee Center for women with disabilities is designed to provide easy access for women with disabilities, with adaptive equipment, dedicated staff with experience working with women with disabilities, and flexible length to appointment times. The center is designed to overcome physical barriers to routine women's health care. Women in wheelchairs are weighed on a scale in their chairs and the wheelchair is weighed separately later. Our mammogram equipment is wheelchair accessible. Our specialized equipment includes: Scales for weighing women in wheelchairs, universally accessible exam tables, Patient lifts and padded velcro stirrups for comfort. This is solely an outpatient program. It is in an academic hospital.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Higher rates of screening of breast and cervical cancer compared to other cohorts of women with disabilities

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We performed a retrospective chart review to determine rates of screening for mammograms and Pap Smears in patients seen at our facility. We obtained EPIC as a medical records system in 2009, and obtained data from 2009–2012. We found that we saw a total of 560 face to face encounters. In patients ages 20–69, 363 of 432 had received a pap smear. This is a rate of 84%. In our sample of women between the ages of 50–65, 166 of 200 had a recent mammogram - for a rate of 83%. This is considerably higher than other national estimates for women with disabilities. In a CDC study in 2010[1], 75% of women without disabilities and 61% of those with disabilities received a mammogram. In a national CDC survey of women with any basic actions difficulty or complex activity limitation the rates of Pap smears within 5 years was 66% in 2013[2]. 1. Wisdom, J.P., et al..(2010). Health disparities between women with and without disabilities: A review of the research. *Social Work in Public Health*, *25*(3), 368–386. 2. CDC Table 71. Use of Pap smears among women aged 18 and over

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): While there is a great discrepancy in care for women with disabilities, it is remarkable that well known and easily reproducible interventions such as adaptive equipment, educated staff and appropriate time for appointments, can have a significant effect on care. While more studies are needed, we feel that our center is easily reproducible and is a valuable intervention.

IMPROVING THE QUALITY OF CARE FOR HIGH-RISK DIABETIC PATIENTS: THE IMPACT OF A CLINICAL PHARMACIST IN AN URBAN PRIMARY CARE PRACTICE

Stephanie C. Wang; Deborah

Wittman; Naa-Abia Casely-Hayford; Theresa Mack. Mount Sinai St. Luke's Hospital, New York, NY. (Control ID #2706322)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Limited resources for high-risk diabetes care management exert greater pressure on the primary care physician (PCP) leading to physician burnout.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Incorporation of a clinical pharmacist (CP) into a collaborative team-based approach will: 1. Improve diabetic glycemic control 2. Increase cost-savings by enhancing access to healthcare 3. Reduce physician burnout by distributing the care burden of high-risk diabetic patients

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Mount Sinai Doctors Faculty Practice (MSDFP) is a community based academic primary care office located in Harlem, NY. MSDFP serves a predominantly African and Hispanic American population, of which 15% are diabetic. A CP was integrated into the practice to improve quality of care for high-risk patients. CPs with their expertise in medication therapy management (MTM) can assist PCPs in managing chronic diseases, expand patient access and improve patient health outcomes. A collaborative team-based approach can reduce physician burnout, and expand high-quality, low-cost care. The CP developed the collaborative drug therapy management (CDTM) agreements based on current practice guidelines. Diabetic patients with a hemoglobin A1c (HbA1c) > 9% were referred to the CP either during an office visit or via referral. The CP reviewed all medications, provided education on disease state management and proper medication use. All patient visits and MTM adjustments were communicated to the PCP via documentation in the patient's medical record.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The primary endpoint was change in HbA1c. Secondary endpoints included change in low-density lipoprotein, blood pressure and body mass index. Cost analysis was performed on a sampling of patient encounters. Relative value units (RVUs) were calculated and used to compare the difference between collaborative versus usual care (PCP only). Results were examined using descriptive statistics and paired t-tests.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A total of 21 patients with HbA1c > 9% were referred to the CP. The average patient age was 58.6 years (range 39 to 72). The majority were female (71%), and African American (90%). Baseline mean HbA1c was 12.0% (95% CI 11.2 to 13.1). The average HbA1c improved from 12.0 to 8.4% (CI 7.9 to 8.9) over an average of 5 visits in 4 months. Secondary measures trended toward statistical significance. Based on CP productivity, a potential revenue of $60,000 annually was determined. Over a 4 month period, a collaborative team-based approach would result in an estimated $99 of cost-savings per patient compared to usual care.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): This study demonstrated that the redesign of healthcare delivery for a high-risk diabetic population using a CP can improve health outcomes, minimize physician isolation and redistribute the burden of care decreasing physician burnout. Services performed by a CP can generate practice based revenue streams with built-in-cost savings and financial incentives from pay-for-performance programs. Analysis of emergency room and hospital utilization may reveal additional cost savings in avoidable admissions.

INCREASING CLINICIANS' RESILIENCE, ENGAGEMENT AND USE OF COACHING SKILLS THROUGH A PEER-BASED COACHING AND MENTORING PROGRAM Andrea L. Sikon; Elaine Schulte. Cleveland Clinic, Cleveland, OH. (Control ID #2703545)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can a peer-based coaching and mentoring program increase participant engagement and resilience during a time of rapid change in healthcare?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): *1. Facilitate* a coaching and mentoring network for all faculty to increase their resilience, engagement and achievement of development goals. 2.Create *training* for participants in asset-based coaching and mentoring.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Staff Coaching and Mentoring Program (SCMP) was created in 2008 to provide peer coaching for professional development and mentorship for all of our institution's faculty. Participants complete a CME orientation course, differentiating program roles and teaching coaching skills based on fundamentals of relationship-centered communication and positive psychology. The Coach serves as a thinking partner, aiding Coachee in identifying goals and values and how those align with actions, translating these into actionable steps. Coachee may also meet with a Mentor/s, who serve as self defined experts in one of 8 domains, offering specific advice. Program participation is voluntary and peer based.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Course evaluations were assessed and a participant survey administered to understand participant practices and to measure self reported impact of participation on components of engagement, resilience and use of learned skills in daily interactions with colleagues, patients, and in one's personal life. Survey quantitative analysis of participants of both training and also matched relationships used confirmatory factor analysis in the three aforementioned factors. Course evaluations were qualitatively coded from categorizing repeated verbiage according to *3S Understanding* to describe the major emergent themes from the orientation courses.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 335 program participants from across specialties were surveyed in 2016. All roles (coaches, mentors, coach/mentees) reported an increase in the above with those in a matched coaching or mentoring relationship showing a statistically significant increase. Participants reported a moderate-significant increase in expanded relationship with colleagues across the institution. Two revealed staying at our organization due to experience in SCMP. Qualitatively, each theme from 395 evaluations also aligned with one of the three domains of engagement, resilience and use of coaching skills.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A Peer coaching and mentoring program can positively impact engagement and resilience, and provide valuable coaching skills that can be

used in daily interactions across contexts. Even unmatched participants reported additional benefits, suggesting that the training itself can have a positive impact. Additional benefits gained by the organization from having peers engage in such programming extends beyond the direct benefits gained by coachees/mentees. Formal similar initiatives can result in a trained network that supports personal, professional, and organizational resilience and engagement, which ultimately encourages retention and increased quality of patient care.

INCREASING NARCAN CO-PRESCRIPTION RATES FOR PATIENTS ON CHRONIC OPIATES AT AN ACADEMIC PRIMARY CARE CLINIC Jon E. Freise[2]; Elizabeth E. McCarthy[2]; Leslie Sheu[2]; Michelle E. Guy[1]. [1]University of California San Francisco, San Francisco, CA; [2]University of California, San Francisco, San Francisco, CA. (Control ID #2692082)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): In light of the national opioid epidemic, the CDC recommends increasing the prescription of Narcan within primary care practices, but Narcan co-prescription rates with opioids remain low.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): We aimed to explore barriers to prescribing Narcan at an academic primary care clinic. We then designed an intervention to address barriers and increase co-prescription rates of Narcan for patients on chronic opiates.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Our intervention was multi-pronged. First, we administered a 12 question anonymous survey to physicians within the University of California, San Francisco Division of General Internal Medicine to assess barriers to Narcan prescription and provider suggestions to increase Narcan prescription rates. 53 out of 117 (45%) providers completed the survey. Notable barriers to prescribing Narcan included lack of time in appointments (30%) and lack of understanding of how to educate patients about Narcan use (21%). Based on this, we sent individualized emails to providers identifying their patients on chronic opiates, those not prescribed Narcan, and information on prescribing Narcan to encourage discussions. To address concerns about lack of time, medical assistants were asked to pend Narcan during the check-in process for high-dose chronic opiate patients, and providers were encouraged to have clinic nurses educate patients on how to use Narcan.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Improvement in Narcan prescription rate for patients on chronic opiates, particularly those on high-dose opiates (≥50 morphine milligram equivalents/day), is our quantitative measure of success.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): From the start of our intervention on October 3rd, 2016, to December 7th, 2016, the Narcan prescription rate for the 269 high-dose chronic opiate patients increased from 75 (28%) to 99 (37%). Of the 597 total patients on chronic opiates, Narcan prescription rates increased from 103 (17%) to 133 (22%). Looking forward, we will continue our interventions, email providers every two months with updates on individual and collective success, and will additionally interview clinical staff about the impact of discussing Narcan on overall work flow to refine our intervention.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): This quality improvement effort illustrates promising initial improvement of opiate safety through increasing co-prescription of Narcan for patients on chronic opiate therapy. It highlights the importance of performing a needs assessment to inform quality improvement, and the effectiveness of an interprofessional team-based intervention. We hope to provide a reproducible model for other clinics to use to increase Narcan prescription as a harm reduction strategy for patients on chronic opiates.

INDIVIDUALIZED COACHING AS A MEANS OF REDUCING PHYSICIAN BURNOUT. Karim Awad; Anne Dixon; Peter Dreyfus; Joe Kimura. Atrius Health, Boston, MA. (Control ID #2702585)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): The objective of this study is to test the hypothesis that physician coaching will help reduce the severity of burnout in physicians in an ambulatory practice.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Objective: Reduce Maslach Burnout Inventory (MBI) scale by 3 points after 12-weeks of coaching, which will be sustained 1-year after the intervention is completed. A one-point reduction in the MBI scale leads to clinically significant improvements.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Atrius Health is a large multispecialty group practice serving 675,000 patients in eastern Massachusetts. Currently, 54% of physicians experience burnout. Clinician burnout is recognized as a tremendous problem across the country and has been demonstrated to have many consequences, including: lower patient satisfaction scores (J Healthc Manag. 2016;61:105), decreased productivity (BMC Health Serv Res. 2014;14:254), increased medical errors (Annals of Surgery 2010;6:995), and higher turnover rate (J Clin Oncol. 2014;32:1127). Our pilot program will enroll burned out physicians in a formal coaching over a 12-week period. Weekly coaching session will be held to specifically address the physician's burnout drivers.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Reduction in MBI scale by 3 points.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Currently, a high percentage of our physicians are exhibiting symptoms of burnout.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Interventions to help reduce burnout are few. Research indicates that strategies like mindfulness and stress reduction is only modestly beneficial. Our study wishes to prove that coaching physicians is an extremely valuable and beneficial tool to help with burnout.

INPATIENT NALOXONE DISTRIBUTION AT A LARGE URBAN ACADEMIC MEDICAL CENTER Andrea Jakubowski[1]; Alexander Pappas[1]; Lee Isaachsohn[1]; Felipe Castillo[2]; Mariya Mayusokova[1]; Richard J. Silvera[1]; Evan Rausch[1]; Louisa Holaday[1]; Sameen Farooq[1]; Marcus

Bachhuber[1]. [1]Montefiore Medical Center, New York, NY; [2]Montefiore Medical Center, Bronx, NY. (Control ID #2702497)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Inpatient general medical settings are a promising venue to provide overdose education and naloxone distribution (OEND) to patients at risk for overdose, however, few such programs exist.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) To develop and pilot an OEND program on two general medical floors of a large urban medical center.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Led by ten resident physicians from three post-graduate training programs (Family Medicine, Internal Medicine, Psychiatry) and two faculty mentors, we developed and piloted an OEND program. We obtained take-home naloxone kits free-of-charge from the New York City Department of Health and Mental Hygiene (DOHMH) and worked with the inpatient pharmacy to incorporate kits into the inpatient formulary. For the program, we chose a consult service model, whereby the admitting or primary inpatient care team paged the clinical consult team (consisting of rotating members from the planning committee) for any newly admitted patient who had used any opioid in the past year. The consult team members then screened the patients for eligibility. Eligibility criteria were based on current guidelines and included: opioid misuse, receipt of high dose opioid analgesics, concurrent use of opioids with benzodiazepines or alcohol, current hospitalization for opioid overdose or withdrawal, methadone or buprenorphine use, recent release from incarceration, and patient request. Patients meeting eligibility criteria then received OEND from a consult team member through a short video training; patient understanding was informally assessed through teach-back, and the patient was given a take-home naloxone kit upon training completion.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1) Number of consults received 2) Number of eligible patients 3) Number of patients receiving education and a naloxone kit

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): From implementation (April 2016) to the present, we were consulted on 54 patients, resulting in 52 eligible patients. Of those, 21 (40%) were taking high doses of opioid analgesics, 19 (37%) used heroin, 11 (21%) used daily methadone or buprenorphine, 17 (33%) were taking opioids combined with benzodiazepines/alcohol, 7 (13%) were hospitalized for withdrawal or overdose, and 1 (2%) requested training. We trained and provided naloxone kits to 35 (67%) patients; 9 (17%) patients declined training, 5 (10%) were discharged, eloped, or left against medical advice prior to training, 2 (4%) was not able to consent to training, and 2 (4%) already had a naloxone kit.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1) Implementation OEND in the inpatient setting is possible and requires multidisciplinary collaboration with clinical leadership, pharmacy, and public health agencies. 2) Most patients we identified as eligible for OEND had never received it, suggesting that inpatient settings are promising for reaching those who do not currently have access to naloxone. 3) Relying on the primary medical team to page a consult team may have limited our program's reach; alternatives such as identifying eligible patients directly from electronic medical records may be needed.

INTEGRATING BEHAVIORAL HEALTH INTO AN ACADEMIC PRIMARY CARE PRACTICE: COLLABORATION IS KEY Neda Laiteerapong[1]; Mara Terras[1]; Erin M. Staab[1]; Nancy Beckman[1]; Pooja Dave[2]; Sachin D. Shah[1]; Daniel Yohanna[1]; Lisa M. Vinci[1]. [1]University of Chicago, Chicago, IL; [2]University of Chicago Medicine, Chicago, IL. (Control ID #2705881)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): There is a large unmet need for behavioral health care among primary care (PC) patients; however, improving behavioral health care in PC requires a complex health systems intervention.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To improve behavioral health care in PC by integrating behavioral health services, implementing electronic clinical decision support, increasing provider resources, educating providers, and assessing referrals to mental health.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Academic PC practice (Faculty/resident combined full-time equivalents: 18; 26,000 unique patients/year; 40,000 encounters/year). A stakeholder-led team (PC medical director, PC physician champion, chair of psychiatry, psychologist, director of medical informatics, and health services researcher) began meeting monthly in August 2014. Year 1 focused on increasing access and improving the quality of behavioral health care. Year 2 focused on identifying undiagnosed depression. Piloted interventions included an embedded behavioral health clinic 3 half-days per week, clinical decision support for depression screening and management, and physician feedback on screening rates and referral completion.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Faculty/staff perception of level of integration of PC-behavioral health clinic at baseline and 6 months, using a validated tool (score 0 (low)- 100 (high)) and faculty/staff satisfaction with integration of the behavioral health clinic. Change in depression screening rates.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): At baseline, the overall level of integration score was 64.5 (SD 8.4). The program was rated highly in beliefs and commitment (81.8 ± 11.2), leadership (74.6 ± 16.0), and interdisciplinary alliance (70.0 ± 11.2). At 6-month follow-up, the overall score increased significantly (64.5 vs. 70.1, $p = 0.001$), as did three areas with the greatest need for improvement: systems integration (57.0 to 63.8, $p = 0.001$), integrated clinical practice (60.0 to 68.4, $p < 0.001$), and training (56.7 to 65.3, $p = 0.001$). Depression screening increased from 10.0% to 18.2% from 2/16 to 10/16. Each month was associated with a 7% increased odds of screening (odds ratio 1.07, 95% CI 1.06-1.09), adjusting for attending vs. resident physician and patient race, age and gender. About half of providers/staff were satisfied with our progress at 6-months; areas for improvement included expanding to a full-time behavioral health clinic and increasing scheduling of referred patients. We received approval to hire a full-time behavioral health faculty for PC in 11/16.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Improving behavioral health care for PC patients requires a multi-level, multi-stakeholder intervention. Early engagement with a broad range of administrative, clinical, and research stakeholders was key to driving the intervention. Access to patient-level data and use of data analytics to assess the impact of our interventions was instrumental to our advocacy efforts at re-directing resources toward PC-behavioral health integration.

INTEGRATING INDICATIONS FOR USE INTO THE MEDICATION PRESCRIBING PROCESS AT A TERTIARY ACADEMIC MEDICAL CENTER Jackie Ho; Carolyn Wrzesniewski; Noelle Hasson. VA Palo Alto Health Care System, Mountain View, CA. (Control ID #2702164)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): The Joint Commission requires that a diagnosis, condition or indication for use exists for each medication ordered; to our knowledge no studies have described the integration of indications for use into the prescribing process at a health-system.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Describe the development and implementation of a patient-centric clinical indications library into the medication prescribing process. Highlight the operational, humanistic and clinical outcomes of indications on patient prescription labels.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Indications for use on medication orders can increase patient safety by: 1) empowering and engaging patients in their health care and reinforcing adherence to medications; 2) articulating the use of the drug to other health care team members; and 3) decreasing prescribing errors by ensuring the right drug is issued for the right condition. The U.S. Department of Veterans Affairs uses the Computerized Patient Record System (CPRS) Electronic Health Record (EHR) system. In recent months, pharmacists and prescribers have been instructed to ensure that all medications have an indication in the directions on prescription labels. This has caused prescription processing delays and provider/pharmacist frustration. A well-designed organizational workflow and development of outcome measures are needed to determine and track the best way to increase the number of prescriptions with an indication. This project existed in three phases: 1) developing an indications library for each medication orderable item in the EHR system; 2) integrating indications into the prescribing process; 3) measuring outcomes to continually improve both the indications library and operational processes.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Operationally, the percent of medication orderable items with a default indication in the EHR, the percent of outpatient prescriptions with an indication, and the overall prescription verification time for pharmacists before and after the intervention will be measured. Qualitatively, survey of physicians and pharmacists satisfaction with standard work developed around inclusion of indications into the prescribing process will be evaluated. Patient satisfaction surveys will be distributed to assess patient's perception of indication on prescription labels. Lastly, the relationship between indication on patient prescription labels and medication adherence will be analyzed.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): After development of the clinical indications library, medication orderable items in our system with a default indication increased from 29.8% ($n = 717/2,409$) to 72.4% ($n = 1,743/2,409$). Clinical indications library and standard work implementation increased the number of prescriptions with an indication from 64% to 90%. Other findings will be discussed.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1) Recognize the value and benefits of integrating medication indications into the prescribing process 2) Understand the implications and barriers of incorporating indications for use on prescriptions 3) Evaluate how providers can improve patient care through the use of indication information

INTEGRATION OF CLINIC-BASED, OPT-OUT TESTING FOR HCV INTO AN EXISTING HIV TESTING FRAMEWORK AT A COMMUNITY HEALTH CENTER IN CHICAGO Kristin Keglovitz-Baker; Magda Houlberg; Chad Hendry; Laura Rusie; Tommy Schafer. Howard Brown Health, Chicago, IL. (Control ID #2692020)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): How can a community health center best integrate opt-out Hepatitis C testing into an already existing framework for rapid HIV testing?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Systematically determine best practices for the integration of HCV testing into an existing opt-out HIV testing framework. Continuously evaluate and revise current practices to elucidate what would work for our clinical setting. Build a system for ongoing recording and analysis of testing outcomes in order to disseminate successes and opportunities for improvement.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Howard Brown Health, one of the nation's largest LGBTQ healthcare organizations, was awarded funding in 2015 to create best practices around the expansion of routine opt-out Human Immunodeficiency Virus (HIV) testing and integration of Hepatitis C virus (HCV) screening into this framework. After modification of the Electronic Medical Record to prompt for HIV testing, testing was routinized by training Medical Assistants (MAs) to offer testing using a script while rooming/vitaling patients. HIV testing was rapid unless patients preferred lab-based. HCV testing was routinized by adding labs to order-sets for a variety of visits. Education emphasized the importance of HCV screening for patients born 1945–1965, living with HIV, and with IV drug use/sexual risk factors. Positive HCV Ab tests auto-reflexed to a viral load test to determine active HCV.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The following were quantified monthly: the number and percentage of visits where HIV and/or HCV testing were offered and conducted, the number of new HIV and HCV positives identified through opt-out testing, and the number of new HIV and HCV positives linked to care. Patient refusal reasons for testing and barriers perceived by provider (e.g. high HCV testing cost) were documented.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 6961 patients were seen in HBH primary care, an increase of 7.8% from 2013. 85.8% more HIV tests were offered to eligible patients (2982 vs. 1605 in 2013). 10.6% of patients refused tests in 2015 vs. 8.3% in 2013, most due to "no risk". HIV positivity was 1.05% in 2015 vs. 0.88% in 2013. 3 acute HIV infections were found in each year and all new positives were linked to care. 593 of the projected 1500 HCV tests were offered to eligible patients, 282 accepted a test and 18 were positive. 4558 total patients were tested for HCV and 82 were positive. All 31 RNA positives were linked to care. MA-perceived barriers were most often: busy clinic, provider prefers lab test, and visit not related to sexual health.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): HIV test refusal increased in 2015, but a high testing rate was maintained along with higher HIV testing volume. Opt-out testing identified new HIV positives, aided in disclosure for known positives, and facilitated prevention discussion with HIV negatives. High HCV positivity in eligible patients confirmed a need for targeted testing and high positivity in the general primary care population indicates a similar need for general screening. Allowing flexibility in testing type was a barrier for MAs but necessary for buy-in from providers.

INTEGRATIVE PAIN MANAGEMENT CLINIC SERVING HIGH-RISK PRIMARY CARE PATIENTS WITH CHRONIC PAIN Emily E. Hurstak[4, 1]; Barbara Wismer[2]; Kristina Leonoudakis[2]; Joseph Pace[2]; Maria T. Chao[3, 4]. [1]San Francisco Free Clinic, San Francisco, CA; [2]San Francisco Department of Public Health, San Francisco, CA; [3]UCSF, San Francisco, CA; [4]University of San Francisco, San Francisco, CA. (Control ID #2703723)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Primary care clinics have limited access to multimodal treatments to improve patients' pain and minimize reliance on opioid analgesics.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To create an integrative pain management clinic within a primary care safety-net clinic serving a community with high prevalence of chronic pain and high rates of opioid analgesic overdose. To determine feasibility and acceptability of the program by measuring program referrals and participation. To assess the effects of the program on patients' pain intensity, health-related quality of life, and opioid analgesic use.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We designed and implemented an integrative pain management program (IPMP) within an outpatient primary care clinic serving a high proportion of patients with poverty, unstable housing, substance use, and mental health conditions. We designed the program with input from patient and staff focus groups, a multidisciplinary steering committee, and the support of leadership from the San Francisco Department of Public Health. IPMP accepts patients with chronic pain greater than 3 months duration who are prescribed opioid analgesics. IPMP involves group-based participation in behavioral health techniques, educational sessions on topics including neurobiology of pain and medication safety, physical movement sessions guided by a physical therapist, and individual sessions of acupuncture and massage therapy.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Assess program feasibility and acceptability through referrals, participation rates, and qualitative interviews Assess short-term pain management outcomes including patient pain intensity, health-related quality of life, and opioid analgesic use.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Participation: 147 patients were referred to the program. Fifty-five patients completed 12 weeks of participation in one of three cohorts; 15% of participants dropped out before program completion. Sixty-five percent of patients attended greater than 75% of recommended sessions. Pilot Satisfaction: Patients and providers reported high satisfaction with the program; 62% of patients chose to enroll in a graduate group after pilot completion. The most popular program aspects included home-group sessions, massage therapy, mindfulness instruction, physical movement classes, and individual acupuncture sessions. Pain and Functioning: Patients who completed the 12-week program reported decreased isolation, improved coping skills, improved mood, building a sense of community, and decreased pain intensity. Pre and post intervention comparison tests indicate statistically significant improvements in pain interference and pain self-efficacy.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): We found that an integrative pain management program delivered within a safety-net primary care clinic was feasible to patients and providers, and associated with high rates of participation and satisfaction. Given the initial success of this model, leadership within our health system decided to expand the clinic services. Group based multimodal pain approaches may be one strategy to address chronic pain treatment in safety-net clinical settings.

INTERVIEW OSCE (OBJECTIVE STRUCTURED CLINICAL EXAMINATION): A NOVEL STRATEGY IN INTERVIEWING HOSPITALIST APPLICANTS Katherine A. Hochman[2]; Nicole Adler[1]; joshua smith[1]. [1]NYULMC, New York, NY; [2]New York University School of Medicine, New York, NY. (Control ID #2701145)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Hospitalist directors typically rely on the review of curriculum vitae, recommendations from peers and traditional interviews in hiring hospitalists; while important, this strategy has limitations.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Our goal was to complement the traditional strategy in hiring hospitalists with one that allows for direct observation of how an applicant reasons through various common clinical scenarios in real-time. We designed an "Interview OSCE" to complement the traditional strategy.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): After review of the curriculum vitae, recommendations from peers and a brief telephone conversation, applicants were invited to formally interview in person. 4–6 hospitalist applicants were interviewed each day. The interview day consists of opening remarks from the Hospitalist Director and introductions of three additional hospitalist faculty over breakfast. The candidates then rotate through four

stations: one formal interview conducted by the Hospitalist Director and 3 OSCE stations staffed by members of the hospitalist faculty. The three OSCE cases reflected our institutional priorities. These were 1.) goals of care, 2.) value-based medicine and 3.) transitions of care. Before entering each room, hospitalist applicants read a one-paragraph case presentation. Hospitalist faculty were provided a checklist of what constitutes an excellent answer. For the value-based medicine case, for example, the candidates are expected to a.) identify that routine daily labs are wasteful especially on the day of discharge when they have been stable, b.) proceed with discharging a stable patient despite a hemolyzed potassium and c.) use this moment as a teaching opportunity. Each case was designed to last 10 min with 5 min of feedback and discussion. Hospitalist faculty subsequently filled out a short evaluation form. At the conclusion of the rotation, the hospitalist faculty would convene and discuss the candidates in aggregate. Some candidates who performed well on the formal interview were less impressive in the OSCE stations, and vice versa.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We will measure success in two ways: 1.) end-of-year hospitalist satisfaction survey 2.) hospitalist retention

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 23 candidates were invited to participate in the Interview OSCE for the 2015–6 recruitment season (for hospitalists positions to start July 1, 2015). Of these, 16 were offered positions and 9 accepted. Of the 9 that accepted, 100% completed the year successfully and 5 signed on for another year (the remaining 4 enrolled in fellowship programs).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The Interview OSCE is a highly portable, low-cost and effective strategy to complement the traditional means of evaluating hospitalist candidates. In addition to helping choose candidates whose strengths align with instiutional initiatives, the Interview OSCE becomes a powerful means of engaging the current hospitalist faculty in shaping the program.

JOB SHARING IN ACADEMIC INTERNAL MEDICINE, A 25 year EXPERIENCE Janet Sundquist; Catherine P. O'Neill. University at Buffalo, East Aurora, NY. (Control ID #2707018)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Academic medicine suffers from attrition of young faculty and young faculty often struggle with work life balance.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Demonstrate the feasibility and sustainability of an academic medicine job share. Identify potential advantages alternative work arrangements can bring to academic medical centers, including patients and other faculty.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The University at Buffalo Internal Medicine Residency is an academic program training approximately 100 housestaff at three major teaching hospitals in Buffalo, New York. Two physicians arranged a job share of one full time clinical faculty position after completing residency in 1992. The physicians strove to match the job expectations of a full time person, dividing the week into a Monday, Tuesday and alternate Wednesdays schedule for one physician. The other physician worked Thursday, Fridays and alternate Wednesdays. Like most institutions, work responsibilities and schedules as well as employers have evolved; but the job share arrangement adapted over the course of 25 years. Initially responsibilities included both inpatient care in an urban teaching hospital along with outpatient care in a hospital based safety net clinic. The clinic is a continuity site for 30 medical residents as well as rotating medical students. As inpatient responsibilities increased a one week on one week off schedule was developed which was considered half time. Recently the physicians have transitioned to outpatient only.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Length of employment of full time faculty over the same time period can be compared to the length of employment of the physicians in the job share arrangement. Other measures include engagement of the physicians in teaching and administration as well as promotion and recognition.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Over the past 25 years 14 full time physicians have come and gone from the same clinical setting. Only one person hired since 1992 has remained for more than 10 years. Continuity of care is an important goal in resident clinics and faculty with flexible work arrangements may paradoxically give patients greater continuity than full time faculty who move on quickly. Recruiting and replacing faculty is expensive and may offset the cost of benefits for job share physicians. In times of stress a job share is a more flexible arrangement as both physicians can work simultaneously if needed to cover an emergency for another faculty member. Work arrangements developed within the job share such as alternating weeks have become standard for hospitalists.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A job share model can allow physicians the freedom to adapt to changing needs. The program can benefit by retaining faculty and potentially decreasing cost of turnover. Description of a successful job share may help other faculty negotiate and develop alternative work arrangements.

LEAN METHODOLOGIES AND PATIENT SCHEDULING: IMPROVING CONTINUITY IN AN INTERNAL MEDICINE RESIDENT CLINIC Richard M. Atkins[1, 2]; Sonal Patel[1, 2]; Leigh Wynkoop[2]. [1]Duke University, Durham, NC; [2]Durham VA Healthcare System, Durham, NC. (Control ID #2705324)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Patient-provider continuity in the Durham Veterans Affairs (VA) Healthcare System resident clinic is poor and may reduce satisfaction for both housestaff and patients.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Quantify continuity for an Internal Medicine residency ambulatory clinic 2. Study the principal drivers of patient-provider discontinuity through multiple LEAN methodologies 3. Use iterative Plan-Do-Study-Act (PDSA) cycles to improve patient-provider continuity.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT,

PRACTICE OR COMMUNITY CHARACTERISTICS): The Durham VA PRIME clinic is one of three Duke Internal Medicine Residency continuity clinics. Visit level data was obtained from the VA's Corporate Data Warehouse (CDW) for all patient visits from the preceding 12 months. Patient-provider continuity was defined as office encounters during which a patient saw the primary care provider (PCP) identified for him/her in the EMR at the time of the encounter. We studied the data using statistical control charts of weekly continuity. Next, we performed gemba walks and process flow mapping to understand the process of scheduling office visits.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1. Outcome measure - Patient-provider continuity 2. Process measure - Proportion of RTC orders that follow the specified format

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): At baseline, 51% of patient visits to the PRIME clinic were with the identified PCP. This process was in control aside from an unexplained two-month run of improvement in fall of 2015 and drop in continuity in late June/early July 2016, during the period of expected turnover in residents related to academic years. We also found that continuity was higher for PGY-2 and 3 residents (56%) than PGY-1 residents (41%). Based on in-person observations, the "Return To Clinic" (RTC) order placed at the end of every visit was identified as a source of significant variation between PCPs. PDSA interventions designed to standardize this process include the following: 1. At every clinic session, each resident is given his/her schedule for the remainder of the year listing clinic weeks. The resident may then use this schedule to determine the RTC date as the first day of a future week he/she has clinic. Currently, we are tracking how frequently RTC orders are entered according to these instructions using control charts. To date, only ~38% of RTC orders are in the appropriate format which is also in statistical control. 2. We are changing the RTC order template within the EMR to nudge PCPs to enter RTC in the appropriate format and will educate providers on this new process.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1. Achieving patient-provider continuity in IM resident clinics is difficult and can be affected at numerous levels by multiple people or processes. 2. Local scheduling processes (e.g. return-to-clinic orders) can have a large impact on continuity.

LPN-LED INSULIN AND ANTIHYPERTENSIVE MEDICATION TITRATION PROTOCOLS IMPROVE HEMOGLOBIN A1C AND BLOOD PRESSURE IN AN URBAN, UNDERSERVED PRIMARY CARE OFFICE Valerie Ganetsky[2]; Steven Kaufman[1]; Rachel Adams[2]. [1]Cooper Health System, Camden, NJ; [2]Cooper University Hospital, Camden, NJ. (Control ID #2705889)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Long wait times for primary care provider (PCP) appointments and endocrine care limit access to medication adjustment and detract physicians from more complex medical decision-making.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The program objectives were to enhance operational efficiency, patient engagement, and education by task shifting medication titration for insulin and antihypertensive medications to LPNs.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The Cooper Health System Urban Health Institute (UHI) in Camden, New Jersey offers licensed practical nurse (LPN)-led insulin and antihypertensive medication titration protocols to a high-risk, underserved patient population. Titration protocols developed by a PCP, endocrinologist, advanced practice nurse (APN), and PharmD were used to promote patient education and improve blood pressure (BP) and glycemic control were used during visits. Patients meeting the following criteria were eligible to be referred into the LPN protocols from the UHI primary care clinic or from the diabetes group medical visit (GMV) for the insulin titration protocol. Eligible patients included: type 1 or 2 diabetes plus, new insulin start or currently on insulin with hemoglobin A1c (HbA1c) >8% (insulin titration protocol); any patient with BP >150/90 mm Hg or newly initiated on medication (antihypertensive titration protocol). For both protocols, patients were asked to attend a minimum of 4 sessions for education and medication titration.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Pre- and post-intervention HbA1c, systolic blood pressure (SBP), and diastolic blood pressure (DBP) were collected and analyzed using paired t-tests.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A total of 135 and 151 patients were enrolled in the insulin and antihypertensive titration protocols, respectively, between 7/2015 and 10/2016. Mean age was 57 years and mean number of protocol visits was 4 ± 3. The population consisted of underserved racial/ethnic minorities (60% African American, 35% Hispanic), with 45% of patients on Medicaid insurance. Mean baseline HbA1c and BP was 10.2 and 152/90 mm Hg, respectively. Among the 70 patients that had baseline and follow-up HbA1c values within 6 months of the most recent LPN visit, there was a statistically significant difference in the mean pre- and post-HbA1c: −0.85 (95% CI, −0.15 to −1.55, $P = 0.02$). Among the 47 patients that were enrolled in the insulin titration protocol and did not attend diabetes GMVs, the mean pre- and post-HbA1c was −0.57 (95% CI, 0.30 to −1.44, $P = 0.2$). There was also a statistically significant difference in pre- and post-SBP [−9.5 mm Hg (95% CI −5.62 to −13.34, P value <0.00001)] and DBP [−4.83 mm Hg (95% CI −2.67 to −7.00, P value <0.00001)]. Mean post-intervention BP was 142/85 mm Hg.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Low-resource PCP offices have limited resources for patient education and frequent visits for medication titration. Task shifting insulin and antihypertensive medication titration from physicians to LPNs enables relationship building, increases patient education, and frees physician appointments for complex decision-making in a cost-efficient manner.

MEDICAID ENROLLMENT INITIATIVE AT A STUDENT-FACULTY COLLABORATIVE CLINIC IN A BOSTON JAIL Kavitha Anandalingam[2]; Christian Kaufman[1]; Daniel McGuire[1]; Manjinder Kandola[2]; Molly Zhao[3]; Justin Reynolds[3]; Kimberly Sue[1]; Matthew Tobey[1]; David Beckmann[1, 2]; Lisa Simon[4, 2]. [1]Massachusetts General Hospital, Boston, MA; [2]Harvard Medical School, Boston, MA; [3]Harvard College, Cambridge,

MA; [4]Harvard School of Dental Medicine, Boston, MA. (Control ID #2700402)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Millions of people leave incarceration or detention without health insurance; these individuals have higher rates of physical and mental health conditions than the general population, and post-release remain less likely to access medical care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) Develop a team as a component of the weekly student-faculty collaborative clinic at a large county jail in Boston to begin the Medicaid insurance enrollment process for detainees, which may help expand healthcare access, increase social stability, and lead to decreased rates of recidivism. 2) Provide an opportunity for interested members of the clinic team to become more involved in advocacy and research efforts.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The Nashua Street Jail (NSJ) houses nearly 600 male detainees engaged in court processes, who stay for a time ranging from several days to two years. The jail has a single discharge planner who aids detainees' transition back to the community, including enrolling them for health insurance through Medicaid. The student-faculty collaborative clinic at NSJ is part of the Crimson Care Collaborative, an interprofessional organization administered by the Stoeckle Center for Primary Care Innovation at Massachusetts General Hospital. The clinic includes medical students, nurse practitioner and physician assistant students, dental students, and undergraduates. Clinics are held at the jail once per week and include medical, mental health, education, dental and Medicaid enrollment teams. Students involved in Medicaid initiative complete online modules to become a Certified Application Counselor and are trained by the jail's discharge planner to complete Medicaid applications. The discharge planner identifies the individuals to be registered. During each clinic, a student will help 3 to 4 detainees complete the first of two necessary steps for Medicaid enrollment.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): During the 2.5 months of the pilot phase of this initiative, 30 detainees started the process for obtaining MassHealth during our weekly clinics at NSJ. Detainees may also register to vote. As of December, nine students have completed the certification and training process.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Our experience in the clinic has helped to elucidate the varied challenges individuals face when attempting to enroll for coverage, including having a native language other than English, differing levels of literacy, and difficulties with vision. Additional efforts are required from participants after discharge, including documentation attesting they are no longer incarcerated and selecting a specific insurance plan, and in the future, we hope to follow up with individuals to explore further barriers to insurance enrollment and access to care after release.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A individual's time in jail or prison offers an opportunity to plan and arrange follow-up just prior to a critical transition of care. Students can play an important role in both establishing and supporting existing systems to aid in that transition.

MENDING THE DISCHARGE FENCE: IMPLEMENTATION OF A COMMUNITY HEALTH HOSPITALIST AMBASSADORSHIP PROGRAM (CHHAP) Patrick Ryan[1, 3]; Chi Zheng[2, 3]; Sarah A. Stella[2, 3]; Rebecca Hanratty[1, 3]. [1]Denver Health, Denver, CO; [2]Denver Health Medical Center, Denver, CO; [3]University of Colorado, Aurora, CO. (Control ID #2705027)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Since the advent of hospitalist medicine there has been an increasing division of labor between inpatient and outpatient providers leading to fractured care, decreased provider satisfaction and the potential for errors in discharge transitions.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The goals of this program were to: 1) improve communication between inpatient and outpatient providers, 2) identify transitional care practices needing improvement, 3) improve provider satisfaction.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): In a vertically integrated system with a 525 bed hospital and 9 federally qualified community health centers with a shared electronic health record (EHR), communication between hospitalists and primary care providers (PCP) is not standardized, and there was a perceived lack of communication and collaboration on issues pertaining to transitions of care. Through a Transitions of Care (TOC) workgroup comprised of hospitalist and PCP leaders, hospitalists volunteered as "ambassadors" to each CHS clinic and would attend clinic staff meetings on a quarterly basis. This provided a point-of-contact and opportunities for regular face-to-face interactions with PCPs. The TOC workgroup would review findings of the CHHAPs program in monthly meetings, and identify system-based processes needing improvement. We hypothesized that the CHHAPs program might improve communication and feedback between hospitalists and PCPs, and identify interdisciplinary solutions to address system-wide gaps in transitional care. We also hypothesized that increasing hospitalists' engagement in the community they serve might improve collegiality and satisfaction among both hospitalists and PCPs.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Questionnaire of PCP and hospitalist leadership was used to measure sense of community and collaboration between PCPs and hospitalists and provider satisfaction with CHHAPs.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 100% of 11 identified PCP and hospitalist leaders responded. 64% of respondents identified a lack of time as a barrier to communication between PCP and hospitalists. 82% found that the use of CHHAPs provides a means to address barriers in communication. 64% found that CHHAPs improves sense of community between departments identifying themes of feeling connected, improving team work in patient care and developing collaborative partnerships. 82% identified CHHAPs as a means of improving provider satisfaction. CHHAPs has had an integral role in QI projects in improving the accuracy of admission medication reconciliation and process of home oxygen ordering upon discharge.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A hospitalist ambassadorship program may improve communication and increase satisfaction and engagement among PCPs and hospitalists, and create a venue for systematically studying the needs of community health as they relate to transitions of care and developing collaborative solutions to address unmet needs. While this program has been sustainable in a vertically integrated system, it may also be of benefit in non-academic, community based settings that lack shared resources and EHR.

MOBILE INSULIN TITRATION INTERVENTION (MITI) - A TEXTING PROGRAM TO HELP TYPE 2 DIABETES (T2D) PATIENTS AT BELLEVUE HOSPITAL AND GOUVERNEUR HEALTH FIND THEIR BASAL INSULIN DOSE - AN INTERIM ANALYSIS
Natalie K. Levy2; Natasha Orzeck-Byrnes[2]; Dana Moloney[2]; Sneha R. Aidasani[2]; Lu Hu[1]; Aisha Langford[1]; Yiding Jiang[1]; Mary Ann Sevick[1]; Erin Rogers[1]. [1]NYU School of Medicine, New York, NY; [2]NYU School of Medicine, Bellevue Hospital, New York, NY. (Control ID #2693330)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): T2D patients needing insulin adjustments require multiple clinic visits for titration, but face barriers (missed work, transportation costs, clinic co-pays) all of which disproportionately affect vulnerable populations.
OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): MITI aims to be clinically efficacious, patient-centered, and highly accessible (only requires text messaging and phone calls).
DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): MITI is an efficacious, patient-centered, accessible program that remotely guides T2D patients to their correct basal insulin dose (glargine, detemir). Eligible patients have T2D, an A1c >8%, a phone that can text, and need titration of basal insulin. Patients referred by their providers are enrolled on a secure website which sends a weekday text message asking 'What was your fasting blood sugar this morning?' Each day the MITI nurse checks the website for alarm values (extreme high or low values). Once a week, the MITI nurse calls patients and, using the MITI titration algorithm, advises them on dose adjustments. The goal of the program is to find the optimal basal insulin dose (OID), which is the dose that achieves a fasting blood sugar between 80 and 130 (or the maximal dose of 50 units). MITI lasts a maximum of 12 weeks. When the program ends, patients return to usual care.
MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Using a single-group, quasi-experimental approach, we examined the proportion of patients reaching OID within 12 weeks, the mean number of days required to reach OID, and reductions in fasting glucose and A1c. We described participant response rates, staff time required to deliver the intervention, and patient time saved. Qualitative interviews were also conducted.
FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Of the 71 participants who completed the program, 86% reached OID, 5.6% did not reach OID, and 8.5% terminated the program early. Those reaching OID did so in a mean of 21 (SD 21) days. Fasting glucose levels decreased from 209 (SD 77) mg/dl to 140 (SD 45), and mean A1c (for those with follow up labs thus far) decreased from 11.6% (SD 1.9) to 10.0% (SD 2.2). Ninety-one percent of text prompts received a response from the participant. Mean staff time required to deliver MITI was 16 min (SD 5) per participant per week, and patients reported a mean time saving of 150 (SD 74) min each time an in-person visit was averted. Qualitative interviews suggest that clinical staff perceived MITI to be a preferred alternative to clinic-based insulin titration, one that resulted in good care without interfering with clinic flow. Patients reported that the enrollment process was easy and that MITI motivated them to eat healthier food, take their insulin, and check their blood sugars. Because of MITI they reported feeling more connected to their medical team.
KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): MITI is a clinically efficacious, patient-centered and accessible program for the titration of basal insulin for T2D patients. By eliminating the need for in-person access, MITI proves especially helpful for vulnerable populations. Patients and staff found MITI to be convenient, time-saving, and motivating for patients.

MPATH-LUNG: AN EHR-BASED CLINICAL INFORMATICS LUNG CANCER SCREENING PROGRAM
Ajay Dharod[1]; Christina Bellinger[2]; Kristie Foley[2]; Doug Case[3]; David P. Miller[1]. [1]Wake Forest School of Medicine, Winston-Salem, NC; [2]Wake Forest School of Medicine, Winston Salem, NC; [3]Wake Forest, Winston-Salem, NC. (Control ID #2706102)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Despite guidelines recommending Low Dose Computed Tomography screening (LDCTscr) for lung cancer in high-risk individuals (defined by age and smoking history), usage of LDCTscr in the United States has been low.
OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): −Create an EHR algorithm to identify potential candidates for LDCTscr. -Create a LDCTscr web application (mPATH-Lung WebApp) to determine patients' eligibility for LDCTscr and, if eligible, present a personalized decision aid with instructions for obtaining a LDCTscr. -In a pilot study of 1000 patients, assess the feasibility of a clinical informatics LDCTscr intervention that combines the EHR algorithm and mPATH-Lung WebApp.
DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We combined the EHR algorithm and WebApp into a system for population-level LDCTscr. The EHR algorithm identifies potential candidates for LDCTscr scheduled to see a primary care provider within 1 month. These patients are sent a secure patient portal message notifying them of their potential eligibility for LDCTscr and invitation to complete the mPATH-Lung WebApp via hyperlink. The mPATH-Lung WebApp allows users to determine their risk of developing lung cancer over the next 6 years and presents personalized risk-benefit information.
MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The primary measure of success is the number of patients who complete the mPATH-Lung web-decision aid. Secondary measures include: proportion of patients who read the patient portal message, proportion who click on the embedded web app link, proportion

confirmed eligible for LDCTscr, proportion who request a LDCTscr test, proportion having a LDCTscr test ordered, and proportion completing screening.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Among the first 388 potentially eligible patients who were sent patient portal messages, 130 (33.5%) visited the mPATH-Lung WebApp. 14% (18/130) abandoned the WebApp before eligibility for LDCT could be determined. Among the remaining 112 patients, 24% (27) were confirmed eligible for LDCT and 76% (85) were ineligible, primarily because they quit smoking greater than 15 years ago (53/85, 62%). Most eligible patients (20/27, 74%) determined their lung cancer risk, with risk levels ranging from 0.4% to 13.4% (mea*n* = 3.8%). 22 patients indicated their level of interest in being screened: 23% (5) wanted screening, 36% (8) did not want screening, and 41% (9) were not sure. The mean risk for developing lung cancer did not differ by patients' screening decisions (3.8% for those who wanted screening; 4.2% for those not wanting screening; 3.5% for those unsure; $p = 0.74$)

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The creation of the EHR algorithm required several validation cycles to exclude individuals with a disease predicting short life expectancy (not appropriate candidates for LDCTscr). More patients than expected visited the mPATH-Lung WebApp. There was a low abandonment rate indicating robust website design. The mean risk for developing lung cancer was not significantly different among those who wanted, did not want, or were not sure they wanted screening, suggesting factors other than absolute risk alone drive patients' screening decisions.

MULTI-SITE INTEGRATION OF AN INNOVATIVE LONGITUDINAL QUALITY IMPROVEMENT CURRICULUM TO IMPROVE RESIDENT PATIENT OUTCOMES

Natasha Parekh[3]; Elena Lebduska[1]; Erika L. Hoffman[2]; Amar Kohli[4]; David C. Demoise[4]; Jaishree Hariharan[4]. [1]University of Colorado, Aurora, CO; [2]VAPHS/Univeristy of Pittsburgh, Pittsburgh, PA; [3]University of Pittsburgh, Pittsburgh, PA; [4]University of Pittsburgh Medical Center, Pittsburgh, PA. (Control ID #2706535)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Although previous literature evaluated the effectiveness of an innovative residency quality improvement (QI) curriculum at one clinical site over one year at our institution, it is unknown how the integration of the QI curriculum at different clinical sites over multiple academic years affected resident patient outcomes.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Assess the effectiveness of a longitudinal team-based quality improvement curriculum on resident patient outcomes at 3 clinical sites over 2 academic years (AYs).

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): A stepwise longitudinal curriculum was designed to simulate the Plan-Do-Study-Act cycle of QI. It was implemented at 3 sites with varying resources: a large academic center with 56 residents, a community-based clinic with 25 residents, and a VA-based clinic with 56 residents. Each site's residents developed and implemented new QI projects based on their site residents' lowest adherence to quality metrics and institutional needs, which differed each AY. AY1 was 9/2014-6/2015, and AY2 was 9/2015-6/2016. Major themes of the curriculum included: 1) brief didactics on QI principles and identification of QI projects; 2) creation of aim statements using resident analysis of their own panels' quality metrics; 3) collaboration between residents and staff to form a "QI council" that determined practice, provider, and patient interventions to achieve aim statements; and 4) provision of transparent and timely data for continuous re-evaluation.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The academic center's QI projects were diabetic foot and eye exams in AY1 and blood pressure (BP) control (<140/90) in AY2; the community-based site chose diabetic foot exams for AY1 and eye exams for AY2; and the VA site chose BP control in AY1 and BP control in diabetics for AY2. We assessed effectiveness through quality metric rates from quarterly patient outcomes reports.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): At the academic center, resident foot exams steadily increased from 64% to 78 and eye exams increased from 42 to 69% in AY1. BP control increased from 51 to 61% in AY2. At the community clinic, resident foot exams increased from 59 to 66% in AY1 and eye exams increased from 44 to 77% in AY2. At the VA, BP control increased from 67 to 87% in AY1 and diabetic BP control increased from 75 to 90% in AY2. All increases were steady as demonstrated through QI run charts (unable to show on abstract).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our innovative QI curriculum was successfully implemented at 3 sites with varying resources and different QI projects. We showed dramatic improvements in each QI project's quality metrics at the end of their respective academic years. Active resident participation, QI project selection based on each sites' specific quality metrics and resources, team-based collaboration for QI intervention development and implementation, and data transparency and availability for re-evaluation were keys to success. Future research will need to assess sustainability of previous QI projects as new QI projects are selected.

MYLIFE: USING IMPLEMENTATION SCIENCE TO DEVELOP A DIGITAL HEALTH PROGRAM THAT ENCOURAGES HEALTHY BEHAVIORS IN PATIENTS AT RISK FOR LIFESTYLE-RELATED CHRONIC DISEASES

Daniel M. Croymans[1]; Paul Bixenstine[1]; Ian M. Hurst[2]; Carlos Casillas[3]; Lisa Gantz[1]; Sung Hyun Kim[3]; Sally Elliott[3]; Sarah Tan[2]; Alice Kuo[1]. [1]UCLA Health, Los Angeles, CA; [2]UCLA, Los Angeles, CA; [3]UCLA David Geffen School of Medicine, Los Angeles, CA. (Control ID #2707077)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can digital health technology be integrated into the electronic medical record and the primary care setting to encourage healthy behaviors in patients at risk for lifestyle-related chronic diseases?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To assess whether a primary care setting can integrate a comprehensive digital health program to: 1) encourage patients to adopt healthy lifestyle behaviors, 2) improve patient engagement and

motivation, and 3) help providers counsel patients in prevention and treatment of lifestyle-related chronic diseases.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): UCLA primary care providers (PCPs) referred patients for enrollment. Upon intake, study personnel gave patients an activity tracker (Jawbone UP3) and instructions for using the mobile application. Patients set exercise goals, identified barriers and discussed solutions. Patients then received follow-up calls every 2 weeks and 4–6 text messages per week designed to help them stay motivated, set actionable goals, and reflect on their progress. PDSA cycles were used to evaluate and refine the MyLife program preliminary results and feedback. In phase 2, the messaging system includes food diaries and utilizes SMART strategies to improve patient motivation. Behavior Change Techniques (BCT) Taxonomy was consulted to guide iterative improvements.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Patient data was compiled from Jawbone UP3, the REDCap survey tool, and Chorus (a HIPAA-compliant messaging platform). Team progress is evaluated using the IHI Collaborative Assessment Scale and patient/provider feedback. Patient success is assessed by changes in patient bodyweight, blood pressure, and nutritional choices. Patient engagement is assessed by PAM13.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Participant baseline characteristics (cycle 1, $n = 12$; cycle 2, $n = 10$) include mean age 42 ± 11 years, 50% female, BMI 35.4 ± 7.5, and PA 34.5 ± 38 min/wk. Patients responded to 74% of messages and wore the device 92% of the time. Patients who completed the program increased their baseline PA by more than 200 and lost an average of 5% of their bodyweight. In total the program uses over 100 unique, branching logic messages. Current results suggest that patients can maintain healthy behaviors if validated behavior change techniques are integrated alongside digital health technology. The MyLife team aims to make communication more interactive in future cycles by supplementing targeted health coaching with chatbot technology.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1) Health personnel should start with a target patient population and a few clinics with providers who are willing to give regular feedback. 2) Success of integrated digital health programs is dependent on identification of key stakeholders within the healthcare system and coordination across multiple departments including Information Technology, Operations, and Compliance. This is crucial for connecting data systems and ensuring security and compliance standards are met. 3) Quality improvement efforts are assisted by an integrated data system that can display patient performance metrics in real-time to the program team.

NO PAP LEFT BEHIND: AN INNOVATIVE SYSTEMS AUTOMATION TO OPTIMIZE TIMELY AND APPROPRIATE FOLLOW UP OF CERVICAL CANCER SCREENING. Ellen F. Yee1, 2; Nancy FryeWeaver[1]; Allison Murata[1]; Larry Massie[1]; James Goff[1]; Glen Murata[1]. [1]NMVAHCS, Albuquerque, NM; [2]University of New Mexico, Albuquerque, NM. (Control ID #2698182)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Appropriate and timely follow up of women who have had cervical cancer screening is important to ensure that needed care occurs without delays.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Systematically identify women who have had cervical cancer screening with pap smears and human papilloma virus (HPV) testing. 2. Use innovative data and information technology approaches to track these test results to optimize timely and appropriate follow up.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The New Mexico VA Health Care System (NM VAHCS) includes 13 Community Based Outpatient Clinics (CBOCs) and the main facility in Albuquerque. Individual providers are responsible for cervical cancer screening and follow up, but guidelines for follow up are complex. We created a pap smear and HPV registry using analytics and advanced programming. A cervical cancer screening dashboard assists with finding women due for paps. The pap/HPV registry program then incorporates critical pathways, branching decision trees, and programming of complex algorithms. Use of the registry is intended to create a safety net to ensure that women with abnormal cervical cancer screening tests have the appropriate follow up.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): This work involved collaboration between Clinical, Lab, and Informatics Services. We accessed the Veterans Integrated Service Network (VISN) 18 data warehouse for quality improvement purposes to identify women Veterans who receive care at the NMVAHCS and who had cervical cancer screening. Microsoft SQL programming linked Pap smear results and HPV results by patient. We wrote 57 algorithms using the following variables: current age, current co-test or pap result, previous co-tests or pap results, and previous treatments identified by CPT codes in order to determine identify women who did not have follow-up and who required further attention.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): There were 3268 women Veterans in the NM VAHCS system with a primary care provider. Of these, 2168 were eligible for cervical cancer screening and 1100 were not eligible due to age or hysterectomy. Since 2/6/14, there were 1213 normal paps, 149 abnormal paps, 51 unsatisfactory paps, 8 cancelled/other paps (total of 1421 paps). There were 35 women identified as needing follow up. This group included 13 women needing a pap (11 were notified, 2 had no follow up scheduled), 9 women who moved, 3 women notified and awaiting colposcopy, 2 who declined care, 3 who cancelled or no-showed, 2 with outside care, and 3 who had a colposcopy or hysterectomy (found by chart review).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Follow up of test results is time consuming and can lead to gaps in care if an abnormal test result is missed. An automated system using health informatics and data can be developed to identify missed opportunities in cervical cancer screening follow up. A collaborative partnership between clinical care, lab services, and informatics is needed to create the registry, and local expertise is vital to implementation of this system. A coordinator to utilize the registry system and assist with follow up care would be helpful to busy providers.

OUTPATIENT APPOINTMENT SCHEDULING FOR DISCHARGED PATIENTS - A SUCCESSFUL TRANSITION OF CARE. Ebenezer Oni[1,2]; Tanyka S. Sam[1]. [1]The Brooklyn Hospital Center, Brooklyn, NY; [2]Mount Sinai Ichan School of Medicine, Brooklyn, NY. (Control ID #2707769)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Ensuring continuity of care on outpatient after discharged from inpatient care is often a significant challenge for care givers and a burden for residents mandated to sure a safe transition of care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Transition of care is an established index to reducing hospital readmission rates. While safe practice requires discharging patients from the in-patient wards with scheduled follow up appointments, this process can be very challenging for the resident who is encumbered with other clinical activities. Objectives: 1. We aimed to assess overall post-hospital follow up rates and readmission rates before and after intervention in one of the busiest medical units in the hospital. 2. Coordiate with ancillary staff to develop strategy to ensure all discharged patients have a scheduled follow up visit with a PCP on discharge.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Intervention: Residents worked with the hospital to design, implement, and evaluate an improvement project through the framework of a Quality Improvement Clinic, a 6-month structured educational program providing didactics and small group mentorship on using PDSA cycles to improve outpatient appointment scheduling rates post discharge. Using the process mapping technique, we identified major gaps in the scheduling process. We collaborated with clerical staff and the informatics department to implement a step-by-step algorithm for the post-discharge follow-up process. Our education intervention included didactic educational sessions for all housestaff and discharge software training for all ancillary staff in charge of scheduling follow up appointments.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Pre-intervention, baseline data showed an average hospital post discharge follow up appointment rate of 20 and readmission rate of 23% between December 2015 - January 2016. After the first PDSA cycle of our intervention, post discharge appointment scheduling follow up rate improved to 42% with a corresponding decline of readmission rate to 11% in June 2016.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): After the first PDSA cycle of our intervention, post discharge appointment scheduling follow up rate improved to 42% with a corresponding decline of readmission rate to 11% in June 2016.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our project demonstrates how a multidisciplinary and collaborative intervention can improve transition of care. These efforts can reduce hospital readmissions and improve overall patient care and also impact positively on resident training. A resident-led approach created the space for housestaff to work collaboratively with ancillary staff to identify and address weaknesses in the discharge process. In addition to providing residents with invaluable training on systems-based practice, the process of working with hospital leadership to jointly address an issue that was negatively impacting both patient outcomes and resident satisfaction allowed housestaff to take proactive leadership in improving the environment of care for all. Further evaluation and follow up of this intervention is imperative to achieving sustained improved in these important matrices.

PALLIATIVE MEDICINE CONSULTATION TRIGGERS ON THE GENERAL PRACTICE UNIT Melanie Robbins-Ong; Kristen A. Chasteen; Matthew T. Cerasale. Henry Ford Hospital, Detroit, MI. (Control ID #2707518)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Identifying patients on general practice units who could benefit from a palliative medicine consultation can be difficult and there is little available literature to help guide selection.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Develop evidence-based criteria for identification of patients who would benefit from a palliative medicine consultation. 2. Integrate the criteria into a sustainable workflow, such that the volume of triggered consultations is manageable to be seen daily.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The development of criteria to trigger a palliative medicine consultation began with a review of the available literature. Multiple studies have created consultation criteria for the intensive care unit. Features of these studies were selected that could be applied on general practice units. An initial list of patient characteristics was developed and included potentially life-threatening condition plus positive "surprise" question, ≥2 hospitalizations for the same condition in 3 months, admission for difficult to control physical or psychological symptoms, metastatic or incurable cancer, advanced dementia, failure to thrive, or admission from advanced care facility, which was to be applied upon admission. Secondary criteria were developed to increase specificity of patients who would benefit from consultation. These criteria included ongoing distressing physical or psychological symptoms, social or spiritual concerns affecting daily life, lack of understanding of current illness, goals or care unidentified, uncertainly of decision maker, or treatment options do not match patient-centered goals, which would be applied on the second day of hospitalization and only to patients who met the initial criteria.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The primary outcome measure of the project is the number of consultations that would be generated daily. Initial process measures include the number of patients triaged and the number of patients who meet the first set of criteria. Qualitative feedback from the general practice unit teams on the aid from the completed consultations would also be reviewed.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Two PDSA cycles using consultation trigger criteria were completed on a single general practice unit with largely qualitative data collection. The first cycle found the single-step criteria was easily applied in daily rounds, but there was initially discrepancy amongst the providers regarding criteria definitions. Nearly 50% of new admissions met the initial criteria. During the second PDSA cycle, fewer patients met the initial trigger criteria and even fewer met the second step. The volume of potential new

consultations averaged less than one per day. The project lead felt the criteria were easy to apply, but had to help guide the other members of the team on criteria application.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A two-step, evidence-based, criteria for recommendation of a palliative medicine consultation was able to generate a sustainable volume of potential new patients on general practice units who would be highly likely to see benefit from a consultation.

PARTNERSHIP BETWEEN PROVIDERS AND COMMUNITY-BASED HEALTH COACHES TO IMPROVE DIABETES OUTCOMES IN PRIMARY CARE Jamillah Hoy-Rosas[2]; Manmeet Kaur[2]; Victoria L. Mayer[1]; Laurie Edelman[1]; Jonathan Arend[1]. [1]Icahn School of Medicine at Mount Sinai, New York, NY; [2]City Health Works, New York, NY. (Control ID #2706771)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Community-based health coaching programs have shown promise in improving outcomes for high-risk patients with diabetes mellitus (DM), although integration of such services into the workflows of primary care practices is often lacking. Our academic primary care practice worked in full partnership with a community-based health coaching program to develop, implement, and sustain workflows to manage our high-risk patients with DM.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To optimize the clinical outcomes of high-risk patients with DM; to reduce the cost of care for these patients by preventing excess utilization of acute care services; and to provide an operational model for the integration of a community-based health coaching program into primary care office workflows.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Internal Medicine Associates (IMA), the academic internal medicine practice for Mount Sinai Hospital in New York, NY, serves predominantly Latino and African American residents of East Harlem, a medically and psychosocially complex population with the highest rates of diabetes and diabetes-related complications in New York City. To improve outcomes for our patients with uncontrolled DM, we partnered with City Health Works (CHW), a community-based organization that aims to create healthier neighborhoods and reduce healthcare spending through the delivery of health coaching and care coordination. CHW utilizes neighborhood-specific health coaches to provide home-based self-management support and address social determinants of health. IMA leadership was an integral part of the development of the CHW DM program and continues to meet with CHW regularly to monitor performance and optimize workflow integration. Through a data sharing agreement, CHW utilizes IMA DM registries to identify eligible patients and provides clinical decision support to elicit referrals from providers. Once patients are enrolled, the health coaches and the patients' providers engage in bidirectional communication via Mount Sinai's electronic health record.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We collected data on diabetes-related biometric measures and acute care utilization pre- and post-intervention.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): During the first 3 years of our partnership, 285 patients were enrolled, and 115 completed a full year of the intervention. Mean HbA1c decreased by 1.6 points overall and dropped below 8% in 44% of patients one year post-intervention. Early cost data indicate that CHW achieved an average reduction of $600 per member per month at approximately week 10 of the intervention.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The use of community-based health coaches for DM self-management support has the potential to significantly impact clinical outcomes and cost of care. It is likely that strong partnerships between such organizations and referring primary care practices are critical to achieving success. While the degree of collaboration between CHW and IMA is unique, many aspects of the partnership are scalable. CHW is currently in the process of expanding its model to other primary care sites; the impact of such efforts will be revealing.

PATIENT AND SYSTEM FACTORS ASSOCIATED WITH POOR GLYCEMIC CONTROL AT AN URBAN, SAFETY-NET HOSPITAL John C. Ricketts[2]; Gretchen Snoeyenbos[4]; Alejandra Bustillo[4]; Ashley M. Castillo[2]; John L. Elliott[3]; Sarah Dobro[1]; Stacy Higgins[3]; Shelly-Ann Fluker[4]. [1]Emory School of Medicine, Atlanta, GA; [2]Emory University, Atlanta, GA; [3]Emory University, Decatur, GA; [4]Emory University School of Medicine, Atlanta, GA. (Control ID #2706238)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): To identify factors that are associated with poor glycemic control at an urban, safety-net hospital.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) To identify statistically significant factors correlated to control of Hb A1C in this population; 2) To analyze which of these factors are most likely to provide a benefit when intervened upon.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We decided to investigate factors that influenced the glycemic control of our patients in a large, urban, safety-net hospital in Atlanta, GA as part of a practice improvement project aimed at reducing the percentage of patients with very uncontrolled diabetes (HbA1C >10%). We first developed a 16-question survey that ranged from testing the patients' knowledge of their illness, to delving into patient behaviors, to assessing involvement of multidisciplinary diabetes care provided by the clinic. This survey was distributed to 150 patients who carried an ICD-9/10 diagnosis of diabetes and was answered by 142 patients. It was distributed to patients who completed it prior to seeing the physician and was handed out over a 3 month period. The survey data was then sent to statisticians who performed a multiple regression model to look for significance when compared to patients' actual A1Cs.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The data from the above surveys underwent two separate rounds of analysis. The first round of analysis was to determine the correlation between different patient and system factors that were assessed in the survey, while the second round of data analysis looked at which of these factors was correlated with poor glycemic control.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The first round showed that there was a strong correlation between patient knowledge and whether a patient had seen a nutritionist. Even though having seen a nutritionist was highly correlated with being involved in a multi-disciplinary diabetes care model, being involved with this model was not significantly correlated with knowledge of what an A1C is or what their A1C is. The second round of statistical analysis took into account patient data such as their most recent A1C when they took the survey and showed statistically significant associations with cost and diet. These findings suggest that an area that is ripe for intervention is one that focuses on both cost and food choice.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): For patients receiving care at an urban, safety net hospital, factors such as medication costs and knowledge of diabetes are significant barriers to glycemic control. Multidisciplinary care models, while correlated with improved glycemic control, are not sufficient to overcome these patient-sided factors. Therefore we conclude that interventions to improve glycemic control should focus on public health interventions such as healthy food availability and affordable medications. In this light, we have developed a shopping list based on common grocery stores in our patients' zip codes that focuses on high nutritional value at affordable cost and will be disseminating this list to patients from our original survey and monitoring for improvements in HbA1C while using this tool.

PATIENT NAVIGATION PROGRAM FOR LUNG CANCER SCREENING IN COMMUNITY HEALTH CENTERS Sanja Percac-Lima; Jeffrey M. Ashburner; Nancy A. Rigotti; Elyse R. Park; Steven J. Atlas. Massachusetts General Hospital, Boston, MA. (Control ID #2706141)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Annual chest computed tomography (CT) screening decreases lung cancer mortality in high-risk smokers. Patient navigation (PN) has been shown to increase cancer screening rates in underserved populations.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To evaluate a new lung screening (LS) PN program in older current smokers at 5 community health centers (CHC) affiliated with an academic medical center.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): A population-based information technology (IT) tool was used to identify current smokers aged 55–77 receiving care in the CHCs and randomize them to PN ($n = 400$) or usual care ($n = 800$). Patient navigators (PNs) were trained to educate patients, determine eligibility for LS, and provide brief smoking cessation counseling and referral for tobacco treatment. For LS eligible patients, PNs introduced shared decision making about LS, scheduled appointments with the primary care provider (PCP), reminded patients about appointments, reminded PCPs to order the test, and helped patients attend CT testing and follow-up any abnormal results.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The primary outcome is the rate of LS in the intervention and control groups using intention-to-treat analyses. Current analyses assess interventions performed by PNs using tracking software in the IT tool; including patients contacted, LS eligibility determination, scheduled PCP and CT appointments, and smoking cessation activities. We also interviewed participating PNs ($n = 4$) to explore their perceptions of the program.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): During the first 10 months of the intervention starting in February 2016, PNs contacted 278 patients (70%); 14 declined to talk. PNs determined eligibility for 264 patients, of whom 133 (50%) were eligible. Exclusions included: insufficient smoking history ($n = 122$), competing comorbidities ($n = 6$), moved ($n = 1$), and died ($n = 2$). Brief smoking cessation counseling and referral for treatment if desired was provided to all current smokers. The eligible patients were educated about LS and options. After the PCP SDM appointment, PNs checked whether LS was scheduled/ordered and reminded patients about the test. Overall, 103 eligible patients (77%) in the intervention arm underwent LS. All 5 patients who needed follow up LS to date completed it. PNs reported a variety of challenges: contacting patients, determining eligibility, patients' social/medical needs, availability of timely PCP appointments, PCP forgetting to order LS despite reminder from PNs, and LS ordered but not scheduled.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A PN intervention for smokers in a CHC was feasible and associated with 77% compliance with LS among eligible smokers. However, multiple time-consuming actions were required to assess patient eligibility, schedule and complete PCP SDM visits, and complete screening tests. Only about half of older CHC current smokers were eligible for LS, but the PN encounter provided an opportunity to offer brief smoking cessation advice and referral for all current smokers.

PATIENT SATISFACTION WITH TELEPHONE COMMUNICATION IN AN URBAN PRIMARY CARE CLINIC Samantha Smith; Benjamin R. Doolittle. Yale University, New Haven, CT. (Control ID #2692990)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Patients at a busy, urban faculty-resident continuity clinic reported dissatisfaction with the telephone triage system, particularly with staff returning patient messages promptly and the ability to speak with providers during business hours.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Refocus limited resources to improve the phone communication system with patients Increase the proportion of patients who report that staff always return their messages Decrease patient wait times to speak with staff

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): An exploratory survey ($n = 26$) was conducted to assess patient satisfaction. The survey revealed that patient satisfaction with their clinician was high but was suboptimal with our phone communication. Only 55% of respondents reported that they were always able to speak to someone in clinic, and 33% reported that they never received a call back within 24 hours of leaving a message. A follow

up survey ($n = 200$) again showed that over 1/3 of patients reported never receiving a call back in 24 hours and over 1/3 also reported going to an urgent care center or the emergency room because they were not able to reach clinic staff. During this time, patient complaints were lodged nearly daily to either the medical director or nurse manager. Three interventions were planned. First, a multidisciplinary monthly quality meeting was established, chaired by rotating clerical staff. Second, appointment slots were opened several months in advance to facilitate patients more easily making appointments while in clinic. Third, all messages were entered into the EMR, thereby streamlining triage issues and improving accountability.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Success was assessed with both process and outcome measures. Process measures included clinic staff monitoring of the queue of patients waiting to speak to clinic staff and incoming patient complaints regarding phone triage issues. Outcomes measures include repeating the survey of patient satisfaction and experiences with the clinic phone system.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): There have been several outcomes to date. First, from August 1st - October 31st, 2016, there have been no patient complaints registered to the clinic nurse manager or medical director related to the phone system or obtaining an appointment. Second, the queue of incoming calls has disappeared. Third, the monthly quality meeting is well-attended, with enthusiastic endorsement by staff. Rotating leadership by clerical staff has been a key element to empower shared leadership, encourage ideas, and brainstorm solutions. This meeting has led to several improvements in other areas of clinic operation.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): This project demonstrated that a data-driven collaboration, incorporating several small changes, can improve the phone system. Successful strategies included: developing an understanding of the phone triage workflow, incorporating input from multiple staff to improve buy-in, and choosing to focus on small, achievable changes. Specifically, increasing our clinic's ability to schedule appointments in person likely decreased the volume of incoming patient phone calls.

PCMH-BASED ADVANCE CARE PLANNING INITIATIVE Karen J. Kim[1]; Gayane Galustanian[1]; Lyndee Knox[2]; Heather B. Schickedanz[1]. [1]Olive View-UCLA Medical Center, Sylmar, CA; [2]L.A. Net Community Health Resource Network, Long Beach, CA. (Control ID #2704317)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Large knowledge gaps about Advance Care Planning (ACP) exist for patients and providers, and Patient-Centered Medical Home (PCMH) teams face significant challenges addressing comprehensive ACP, especially in the health care safety net.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Educate patients and families about the importance of ACP and assist them in completing an Advance Health Care Directive (AHCD). 2. Educate PCMH teams about how to discuss ACP and facilitate AHCD completion. 3. Create efficient, patient-centered workflows to incorporate ACP into clinic encounters.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Our team reviewed best practices to improve ACP counseling and AHCD completion in primary care settings. Next, we carried out iterative QI-based interventions to improve our ACP counseling and AHCD completion. We targeted patients aged greater than 65 years in our safety net academic hospital-based clinic population, with the goal of achieving NCQA HEDIS and PRIME (Public Hospital Redesign in Medi-Cal) quality metrics.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We will evaluate our ACP initiative via survey data from patients and PCMH team members. We will ask patients about their experience using a tablet for ACP education and whether it increased their awareness and knowledge of the ACP process. We will ask PCMH staff whether the tools are appropriate and feasible to implement in the setting of a busy clinic. We will also track how many of our target patients have ACP counseling documented in the EMR, and of those, how many successfully complete an AHCD.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We have created a clinic workflow that integrates a brief tablet-based ACP video into the visit intake process. We tested two validated ACP educational tools, and are adapting these to create our own low-literacy videos in English and Spanish. Our PCMH staff telephone-surveyed participating patients regarding questions and feedback on our ACP process and tools. We learned that some patients experienced anxiety when their provider initially discussed the topic, particularly in patients who were unfamiliar with ACP. We also found that the ACP counseling process was time-consuming for PCPs. These challenges may be pronounced in the safety net, where there are lower levels of health literacy. In addition to improving our tablet-based videos for initial ACP education, we plan to create a group visit model wherein a knowledgeable lay provider can provide ACP education for patients and family members together, and facilitate AHCD completion.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our goal is to create high-quality, patient-centered ACP materials and team-based workflows tailored for use in the health care safety net. These novel tools will help equip busy primary care clinics to improve patient outcomes, quality metrics, and provider efficiency with regard to ACP. This addresses a broad systems need to promote ACP and support AHCD documentation as the population ages. Our tools can be adapted to ACP initiatives across other safety net PCMHs and the entire continuum of care.

PEER MENTORSHIP IN DIABETES: IMPLEMENTATION IN A SPANISH-SPEAKING POPULATION Utibe R. Essien[1, 2]; Jacqueline A. Seiglie[1]; Carolina A. Chiou[2]; Marya J. Cohen[1]. [1]Massachusetts General Hospital, Boston, MA; [2]Harvard Medical School, Boston, MA. (Control ID #2701957)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Peer mentorship (PM) has been considered a useful component of diabetes (DM) management but few data exists on its effectiveness in minority populations, which led to the question of whether a PM program among Spanish-speaking patients results in improved outcomes.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. To develop a voluntary peer-mentorship program at a community health center for Hispanic diabetic patients 2. To improve HbA1c outcomes in Hispanic diabetic patients 3. To increase patient engagement in the management of DM

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We developed a PM program and tested it in a 6-month randomized-control trial at the Massachusetts General Hospital Chelsea Health Center (CHC), located in a largely Hispanic Boston suburb. Patients were included in the study if they were adults with DM and self-identified as Hispanic. Patients were invited to attend a recruitment session where they received information regarding the program and brief motivational interviewing training. Mentors were told that they would call the mentee once/week × 12 weeks and once/month thereafter for a total of 6 months. A mentor was chosen as a patient who previously had poor glycemic control (HbA1c >8 within the past 3 years) but had improved over the past year (HbA1c <7). A mentee was a patient who had an HbA1c > 8% within the past year. Controls were chosen from those eligible to be mentees. Patients who did not meet HbA1c criteria were excluded. Patients received a monetary incentive to participate in the study.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The primary outcome, change in HbA1c over 6 months, was compared between the peer mentees and the control group. We also observed the number of clinic visits made over the 6-month study, patient retention and study completion. Qualitative interviews were performed with those who completed the study.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Of 1129 Spanish-speaking patients with DM at CHC assessed for eligibility 965 were excluded and 164 met criteria to be mentors ($n = 82$) or mentees ($n = 82$). After recruitment sessions, 18 patients agreed to participate - 6 as mentors, 6 were randomized to be mentees and 6 to the control group. By the end of 6 months, 4 pairs (8 patients) remained in the study. There was no significant change in HbA1c in mentees (0.14%) compared to the control group (0.13%) or in the number of clinic visits made. Both mentors/mentees found the program helpful though some were overwhelmed by the number of phone calls that had to be made. Some patients felt that group classes would have been helpful.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Implementing a peer mentor program at a community health center is challenging. We learned the importance of support from health center leadership and staff in starting a new initiative. The program may have benefited from expanded training, clear structure, and close follow-up. The patients enjoyed the program saying "it helped a lot with improving my blood sugar" but also that it was "difficult to call because of my busy schedule." By including patients in the development of the program we may have avoided the high rate of loss to follow-up observed.

PERFORMANCE OF THREE MEDICAL HOME RECOGNITION TOOLS ON MEDICARE BENEFICIARY OUTCOMES

Ammarah Mahmud[2]; Justin W. Timbie[2]; Rosalie J. Malsberger[3]; Claude Setodji[3]; Liisa Hiatt[2]; Katherine L. Kahn[3, 1]. [1]David Geffen School of Medicine at UCLA, Los Angeles, CA; [2]RAND, Arlington, VA; [3]RAND Corporation, Santa Monica, CA. (Control ID #2704858)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Ambulatory clinics have several medical home recognition tools available to designate achievement of advanced primary care practices, but little is known about whether clinics achieving recognition with different standards achieve comparable effects on patient outcomes.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): We examined differences in utilization, process, and spending measures associated with three medical home recognition standards—NCQA patient-centered medical home (PCMH) Level-3, The Joint Commission (TJC), and Accreditation Association for Ambulatory Health Care (AAAHC)—among Medicare beneficiaries receiving care at federally qualified health centers (FQHCs).

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): With data from the evaluation of the Centers for Medicare & Medicaid Services' FQHC Advanced Primary Care Practice Demonstration, we compared changes among beneficiaries attributed to 185 comparison FQHCs that achieved one of three medical home recognition types relative to beneficiaries attributed to 519 clinics that achieved no recognition during the three-year demonstration period. Analyses include the subset of Medicare beneficiaries attributed to 94 FQHCs achieving NCQA PCMH Level-3 recognition ($n = 250{,}163$ beneficiaries), 78 TJC-recognized FQHCs ($n = 167{,}150$), 13 FQHCs achieving AAAHC recognition ($n = 49{,}778$), and 519 FQHCs with no recognition ($n = 921{,}223$).

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We used a propensity-weighted difference-in-differences (DID) analysis to examine the differential performance of three medical home recognition tools on utilization, process, and spending measures among Medicare beneficiaries at FQHCs.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Beneficiaries attributed to NCQA PCMH Level-3 recognized FQHCs compared to non-recognized FQHCs had 208 more FQHC visits, 77 fewer specialist visits, 47 fewer non-FQHC primary care visits, and 123 more total primary care visits ($p < 0.05$); 2 percentage points higher rates of retinal exams and 1 percentage point decrease in HbA1c tests for diabetic patients ($p < 0.05$); and decreases in total spending ($434) ($p < 0.001$). Beneficiaries attributed to TJC-recognized FQHCs versus non-recognized FQHCs had 20 fewer inpatient admissions and 45 fewer ED visits per 1,000 beneficiaries ($p < 0.01$); 3 percentage points higher rates of overall testing for diabetic patients ($p < 0.05$); and no change in spending. AAAHC recognition was associated 104 more non-FQHC primary care visits and 166 more total primary care visits ($p < 0.05$); higher rates of overall testing for diabetes patients by 1 percentage point ($p < 0.05$); and no differences in spending.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Variations among the item requirements to achieve recognition may contribute to different patterns of change in utilization, process, and spending measures among FQHC users. Additional comparative analyses are needed to better understand the association between the requirements and elements that make up medical home recognition tools and patient outcomes.

We encourage further research comparing the impact of different recognition types on patient outcomes both within and outside FQHCs.

PILOT OF A LOW-RESOURCE, EHR-BASED TOOL FOR SEPSIS MONITORING, ALERT, AND INTERVENTION Christopher Sankey[1, 2]; Scott Sussman[2]; Kathleen Kenyon[2]; Fangyong Li[3]; Nitin Sukumar[3]; Alan S. Kliger[2]; Robert L. Fogerty[1, 2]. [1]Yale School of Medicine, New Haven, CT; [2]Yale-New Haven Health, New Haven, CT; [3]Yale Center for Analytical Sciences, New Haven, CT. (Control ID #2695047)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): The increased mortality associated with delays in sepsis recognition may be amenable to reduction by improving the identification of sepsis using an automatic, EHR-based warning system.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): *Primary objective*: Improve the identification of patients at high risk for clinical decompensation using an EHR-based, automated detection tool. *Secondary objective*: Develop and implement a low-cost, highly sustainable protocol to allow for rapid cycle improvement and broad deployment.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Using the native EHR (Epic) at our institution, a best practice alert (BPA) was adapted to monitor for patients who newly met modified SIRS criteria. Eligible patients were all adults admitted to the general medical units at the York Street Campus of Yale-New Haven Hospital (YNHH), a 900-bed campus of Yale New Haven Health, a 1500-bed academic medical center. When criteria were met, a “Sepsis Alert” was sent via Epic to the YNHH rapid response team (RRT) Hospitalist attending physician via pager in a HIPAA-compliant format. The attending physician then reviewed the EHR, determined the intervention (ranging from none to bedside evaluation), and documented a Sepsis Alert Note. The entire project was designed with a focus on low cost, ease of implementation, and sustainability.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1. Risk of deterioration of patients identified by the modified SIRS criteria 2. Mortality and ICU-admission

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Our sample included 15,554 adults discharged from YNHH Medicine Service from April 2015 through March 2016 from specified medical units. There were 128 deaths in this group (raw mortality rate 0.82%). A control group immediately preceding the intervention had an unadjusted mortality rate of 0.29%, which did not reach statistical significance (3 deaths in 1027 discharges, OR 2.85, $p = 0.07$). The odds of ICU admission are 1.24 times greater in the period with the program fully implemented compared to the period with no program implemented ($p = 0.04$). The sepsis BPA trigger and completed attending assessment had an OR of death 15.76 (8.63,28.77 with $p < 0.0001$) which approximated that of an activated RRT assessment (OR 15.38, [10.25,23.09 with $p < 0.0001$]). The BPA trigger was additionally associated with increased risk of ICU admission, and hence the modified SIRS criteria appear to identify patients at higher risk of deterioration during their hospitalization. Furthermore, the BPA with completed attending-level assessment carries an increased mortality risk similar to that of a full RRT activation, while requiring substantially fewer resources. From origination to implementation, this project was completed in approximately 12 months and was considerably under budget.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Given the low cost and rapid implementation, this trigger tool appears to be a useful and easily implemented instrument to assist hospitals in identifying sepsis patients at increased risk of clinical decompensation.

PILOT OF AN INTERVENTION TO REDUCE UTILIZATION OF INTRAVENOUS OPIOID NARCOTICS IN HOSPITALIZED MEDICAL PATIENTS Adam Ackerman[1, 2]; Deirdre Doyle[2]; Carolyn Haight[2]; Sheyla Marranca[2]; Christine Day[2]; Robert L. Fogerty[1, 2]. [1]Yale School of Medicine, New Haven, CT; [2]Yale New Haven Hospital, New Haven, CT. (Control ID #2704094)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Opioids are commonly used to treat pain in hospitalized patients, however parenteral use, particularly via the intravenous (IV) route, carries increased risk of adverse events such as euphoria, nausea, and hypotension when compared with oral administration.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) Reduction in IV doses administered to patients receiving parenteral opioid therapy. 2) Reduction in parenteral opioid doses administered to a general population of hospitalized medical patients. 3) Reduction in the rate of patients administered any parenteral opioid.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): A local opioid standard of practice was written on our general medical unit, establishing the oral route as preferred in patients tolerating oral intake, and the subcutaneous (SC) route as the preferred route of parenteral administration. We implemented education for providers and nursing staff on appropriate opioid prescribing, specifically targeting awareness of the SC route as an alternative to IV administration.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The primary measures of success will be reductions in number of parenteral doses administered to patients receiving parenteral opioid therapy, IV doses administered to patients receiving parenteral opioid therapy, and parenteral opioid doses administered to a general population of hospitalized medical patients.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): In preliminary analysis, the use of IV opioids decreased during the intervention (0.087 vs 0.391 doses per patient day, $p < 0.0001$) and the use of any parenteral opioids decreased during the intervention (0.149 vs 0.391 doses per patient day, $p < 0.0001$). Additionally, the rate of patients administered any parenteral opioid decreased during the intervention (0.15 vs 0.14, $p < 0.001$), however the clinical significance of this change is unclear. Mean pain scores were assessed for each patient in standard fashion for the first 5 days of parenteral narcotic administration. For day 1 (5.79 pre-intervention vs 5.81 post-intervention, $p = 0.98$), day 2 (5.12 vs 4.68, $p = 0.26$) and day 3 (4.58 vs 4.30, $p = 0.56$), there were no differences in reported pain score pre- and post-intervention. Day 4 scores were significantly lower

among the intervention group than the control group (4.64 vs 3.48, $p = 0.045$) and Day 5 scores were also lower in the intervention group, but did not reach statistical significance (4.49 vs 3.26, $p = 0.051$).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our low-cost harm-reduction intervention targets the use of IV opioids via education of providers and nursing staff, placing emphasis on awareness of the SC route of inpatient opioid administration. Preliminary data suggest this may be a useful tool to reduce exposure to IV opioids while still providing effective pain control to hospitalized adults.

PILOT PROGRAM TO IMPROVE HYPERTENSION CONTROL IN ACADEMIC MEDICAL CENTER PRIMARY CARE CLINICS. Johan Lane; Daniel Dunham; Anthony J. Perry; Michael Hanak. Rush, Riverside, IL. (Control ID #2702619)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Uncontrolled hypertension is often unrecognized and undertreated in the primary care setting.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The program intervention was designed to help providers recognize uncontrolled hypertension, and to provide a framework for better treatment and follow-up. Objectives of the intervention were to standardize measurement of ambulatory measurement, treatment and follow-up, and to improve overall hypertension control.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): An intervention was performed in 2 primary care clinics; interventions included standardizing the medical assistant workflow for measuring blood pressure, making an abnormal blood pressure more visible to providers, the use of patient registry to outreach uncontrolled hypertensive patients, providing hypertension control rates to providers, and giving electronic prompts to providers to follow-up for uncontrolled hypertensive patients in one month.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Data were collected on the rates and outcomes of one and two month follow-up for patients that had uncontrolled hypertension. Additionally, hypertension control rates were measured by provider and clinic before, during and after the pilot program period.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Baseline hypertension control performance for the calendar years prior to the clinic intervention was 57.95% in 2014, and 61.30% in 2015. The pilot project was initiated in the 3rd quarter of 2015, and the current clinic control rate as of November 2016 is 71.8%. The rate of follow-up within 30 days for uncontrolled hypertensive patients averaged 21% for the first 5 months of 2016. Among the patients that were able to comply with follow-up, 80% showed improvement in blood pressure readings, and 49% showed a controlled blood pressure as defined by BP <140/90 mm Hg.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): During the course of implementing the pilot program, we found that there was wide variation in the procedure used by medical assistants to measure blood pressure. By standardizing this rooming protocol and utilizing automated blood pressure cuffs, we felt that we were able to obtain better accuracy and standardization of blood pressure measurement. Additionally, making the clinic providers aware of the focus on the hypertension project and of their performance on hypertension control as measured by CMS criteria helped to spur more aggressive treatment of hypertension in the outpatient setting. We found that close blood pressure follow-up was associated with better hypertension control, but given the low rates of recommended 30-day follow-up, we feel this is a significant opprotunity for improvement.

POPULATION HEALTH AT HOME: BUILDING A DATA WAREHOUSE AND APPLYING CLUSTER ANALYSIS TO IDENTIFY PATTERNS IN HEALTHCARE UTILIZATION AND MULTIMORBIDITY AMONG PRIMARY CARE PATIENTS Seyed Parham Khalili; Marianna LaNoue. Thomas Jefferson University, Philadelphia, PA. (Control ID #2706763)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Although primary care practices provide a broad range of services to a usually heterogeneous patient population, it is still uncommon for machine learning methodology to be applied at the practice level to simultaneously identify patterns of healthcare utilization and multimorbidity for the purposes of practice design or care coordination.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): First, we present the development of a data repository merging information from multiple sources for a 5-year period starting in 2012, for a large panel of primary care patients. Second, we demonstrate the use of a statistical method known as cluster analysis, to segment a heterogeneous patient population into clusters according to multi-dimensional utilization and multimorbidity. Third, we examine select clusters of patients who may be candidates for case management to help address inefficient healthcare utilization and/or complex care needs.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): This project is implemented in a large urban, academic family medicine practice located on the campus of a tertiary care center in Philadelphia. This site serves approximately 27,000 patients, the majority of whom are age 18 and older, female, either African American or White, and commercially insured. Clinical data consists of diagnosis groups built from ICD-9 and ICD-10 codes for a range of chronic diseases. Healthcare utilization encompasses in-network primary care visits, specialist visits, emergency department visits and hospitalizations.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We present descriptive statistics for our developing clinical practice-level data warehouse. In addition we illustrate year-to-year “cluster maps” for the 5-year period, detailing how the large patient panel may be partitioned into clusters of patients with unique clinical needs and healthcare utilization patterns. Specific strategies for detection of “outliers” in utilization patterns are illustrated along with measures of model fit. Finally the degree of overlap with our institution’s care coordination team, in terms of high-risk patient identification, is provided for perspective.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We find several persistent and clinically salient groupings, including particular combinations of cardiovascular diseases,

diabetes, psychiatric conditions, chronic pain, asthma and obesity. While up to 75% of individuals utilize relatively little healthcare during any given year of the data, there are several smaller unique clusters of patients including a consistently sized cohort of “outliers” (approximately 3% of the population) who utilize significantly more care and who exhibit complex multimorbidity profiles.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The methodology of our project may serve as a blueprint, readily adapted to a variety of practice settings. While some of the patient patterns detected are particular to the community in which our practice is located, the goals of dissemination include the hope that other practices will be able to in turn examine their own community-specific patterns and further inform practice-level changes and institution-level care coordination.

POTENTIAL SOLUTION TO SHORTAGE OF GENERAL INTERNAL MEDICINE PHYSICIANS IN JAPANESE HOSPITALS Urara Nakagawa[1]; Toshiaki Wakai[1]; Masaji Saijo[2]; yasushi tanabe[1]; Dongkyung Seo[1]. [1]Sapporo Tokushu-kai Hospital, Sapporo-shi, Japan; [2]Sapporo Tokushukai Hospital, Sapporo, Japan. (Control ID #2701286)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Shortage of general internal medicine (GIM) physicians in Japanese hospitals

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The need of GIM physicians has been multiplied because of this extremely aging society in Japan. However, comparing the number of GIM physicians per 10,000 population in the USA to the one in Japan, USA has 4.75 times more GIM physicians than Japan. (8.71 in the USA vs 1.83 in Japan, per 10,000) Therefore, the workload for each GIM physician has increased lately, which potentially cause burnout of GIM physicians.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Sapporo Tokushu-kai Hospital, a community hospital with 300-bed in Japan, opened GIM department in 2008 as “Primary Department”, which was responsible for urgent and emergent care, as well as inpatient care in the hospital. However, most of those physicians had retired over 5 years because they switched their specialties. A remained physician hired 2 medical records clerks, which was not a common occupational category in Japan, to support the physician to maintain the department in 2012. They were assigned to document onto electronic medical record (EMR) and writing referral letters based on dictations by the physician, and to take over the physician’s chores including, e.g. physicians’ scheduling, the other paper works, and preparations for presentations.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We used two quantitative metrics to measure the outcome of the intervention; 1) Number of total discharged patients per year from the department, 2) As a quality of patient-care, the rates of sending referral letters to psychiatrists of drug overdose patients on their discharge from the hospital; this hospital was 9th best hospital in Japan which accepts drug overdose patients (2010), and letters for psychiatrists deemed crucial on discharge since the hospital has no psychiatric department, 3) Proportions of time spent on EMR and paper works by the physician.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Majority of inpatients who were discharged from the department were older than 70 years old. (69.2%, 2014) Comparing pre-intervention (2011) to post-intervention (from 2012 to 2014), the findings includes; 1) The number of discharged patients per year from the department was 861 in pre-intervention, and 1003 on average in post-intervention, 2) The rate of sending referral letters was 40% in pre-intervention, and 78% on average in post-intervention, 3) The proportion of time spent on EMR and paper works by the physician was 59% in pre-intervention and 23% in post-intervention. In addition, academic activities including presentations in conferences and recruiting activities were vitalized regardless of increased numbers of patients per the physician.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): GIM physicians’ workload can be decreased by medical records clerks, which may lead efficient inpatients care and potentially maintain quality of patient-care, despite of shortage of GIM physicians.

PRESERVING THE RIGHT TO VOTE IN SICKNESS AND IN HEALTH Carine Davila1; Irina Kryzhanovskaya[2]; Rachel J. Stern[2]; Jeffrey Critchfield[2]; Arla Escontrias[3]; Alon Unger[1]. [1]University of California, San Francisco, San Francisco, CA; [2]University of California, San Francisco at Zuckerberg San Francisco General Hospital, San Francisco, CA; [3]San Francisco Department of Public Health, Zuckerberg San Francisco General Hospital, San Francisco, CA. (Control ID #2703262)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Hospitalized patients lack information on absentee voting during a medical emergency.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To design and implement a program to assist hospitalized registered voters to submit an absentee ballot for the 2016 US general election.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We recruited a multi-disciplinary team including hospitalists, nurses, social workers and hospital personnel, in the inpatient setting of a 418-bed urban safety-net hospital. The program leader, an internal medicine resident, educated team members on absentee ballot procurement, dissemination of ballots, and submission of completed ballots. Key steps to enacting a patient voting program include: − Identify program lead for voting initiative - Research local or state-specific policy on absentee voting in setting of medical emergency - Identify liaison to work with local voting officials - Early outreach to hospitalists, nursing leadership, and staff on absentee voting procedure - Multidisciplinary effort to advertise absentee voting to all eligible patients - Define clear roles and workflow for absentee ballot requests, completion and submission

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We measure success on multiple levels: level of awareness among patients and staff about the absentee voting process during a medical illness; multidisciplinary support for voter participation; and ballot completion among hospitalized patients.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Ballot authorization forms in 4 languages were

distributed to hospital units on Nov. 8, 2016. There were 194 eligible patients: those in surgery or immediately post-operative, critically-ill, in skilled-nursing units, in research trials, or inpatient on the psychiatry ward were excluded. Bedside nurses asked all patients about their interest in voting, distributed forms and collected completed ones. Nurses did not verify voting eligibility. Patients did not participate for the following reasons: not registered, registered in another county, non-citizens, too ill, did not like candidates/issues, or declined without explanation. A hospital representative delivered 27 completed forms to the voting center. Election officials verified 11 (41%) applications and rejected 16 (59%) because applicants were not registered or registered in another county. Of the 11 absentee ballots, 8 (73%) were delivered; 3 patients were already discharged. All 8 ballots were completed and submitted to a polling location on Election Day.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): We describe a successful resident-led patient advocacy initiative to help hospitalized eligible voters submit a ballot despite acute illness. In 2016, US voter participation was only 58.6 and recent elections have been decided by small margins. Poor health is an important barrier to voter participation, particularly among elderly and low-income voters. This program serves as a roadmap for healthcare leaders and voter advocates. Ongoing effort to advertise broadly and galvanize regional leadership is needed to ensure hospitalized eligible voters, despite poor health, can participate in future elections.

PREVENTING AVOIDABLE ED VISITS AND INPATIENT ADMISSIONS IN HIGH RISK PATIENTS Eleanor Weinstein[1, 2]; Dana Mallano1; Leora Botnick[1]; Carey Hamblin[1]; Marie Delgado[1]. [1]Jacobi Medical Center, Bronx, NY; [2]Albert Einstein College of Medicine, Bronx, NY. (Control ID #2698213)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Health care costs are concentrated in small populations of high risk and specifically concentrated in avoidable inpatient admissions and emergency department visits at H+H (Health + Hospitals - the public safety net system in NYC).

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To assist clinicians burdened by providing care for a medically and socially complex population. To use a collaborative care model to better understand the needs of the patient and to plan interventions. To decrease cost and improve outcomes for this high risk group.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The team consisting of nurses, social workers, population health experts, clinicians and data managers worked with a population of 200 high -risk patients (100 Medicare patients and 100 Medicaid patients). Patients were considered high risk based on a risk stratification predictive model used by the H+H Accountable Care Organization for the Medicare group. For the Medicaid group, the patient was considered high risk if they had > 4 ED visits or > 3 hospitalizations in the previous 12 month period. The approach was to review the case in detail looking for red flags including high utilization of inpatient or ED services and low utilization of primary care services; risk score for hospitalization; and total cost of care in the previous 12 months. Patients were grouped according to what was felt to be the driver of the inappropriate utilization. The team met weekly to discuss each patient and plan the intervention. The goal was to engage the patient in appropriate primary care services as well as to deploy care management programs or other interventions addressing gaps in care according to the patient's need.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The outcome measures included a comparison of inpatient admissions, emergency room visits, and primary care visits to the ambulatory practice from baseline to the completion of the intervention period.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The Medicare population was largely one with multiple medical co-morbidities. There was a large number of patients with ESRD in this group. The Medicaid population had many patients with behavioral health issues, substance abuse and social barriers to optimal health. Through the intervention period, we were able to show a decrease in inpatient admissions from 1.79 per patient per year to .66 as well as an increase in primary care utilization from 1.37 to 1.68 visits per patient per year for the overall group. The Medicaid subgroup of this population was difficult to engage in care.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Busy clinicians are unable to optimally care for a high risk population in the standard manner often leading to frustration and burnout. A collaborative model of care utilizing nursing, social work, clinicians and population health experts is key to have an impact on health outcomes in high risk populations. Additionally, we need to explore enhanced coordination and collaboration with the ED and CBO's to provide an alternative model that would support the homeless substance abusing population - addressing the gap in care within the ED - this group's most frequent site of care.

PRIMARY CARE BEHAVIORAL HEALTH INTEGRATION: IMPROVING PRIMARY CARE PROVIDER OUTCOMES? Liza Hoffman[1]; Jillian Burley[2]; Emily Benedetto[1]; Robert Joseph[2]; Collen O'Brien[2]; Ellie Grossman[1]. [1]Cambridge Health Alliance, Somerville, MA; [2]Cambridge Health Alliance, Cambridge, MA. (Control ID #2705709)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): While research indicates that behavioral health (BH) integration can improve the patient experience of care, less is known about how this intervention affects Primary Care Providers (PCPs).

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. To improve care for patients with BH needs in a primary care setting. 2. To understand the functions of BH staff integrated into primary care. 3. To understand how BH integration affects PCPs.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Our internal medicine practice serves 7700 patients and is part of a large, safety net health system in the greater Boston area. The clinic performs annual screening for depression and unhealthy alcohol and drug use in all patients. Integrated BH staff members are available onsite to provide clinical services and to partner with PCPs. The BH team's Mental Health Care Partner (MHCP, 1.0FTE) often serves as the first point of contact; the MHCP provides assistance with triage,

care coordination, brief interventions related to behavior change (e.g. sleep hygiene, risky drinking, smoking cessation), and population management for patients with depression. Integrated Therapists (1.5FTE) are available for informal consults and crisis intervention, and provide short-term psychotherapy for individuals and groups. The clinic's integrated Psychiatrist (.35FTE) provides medication consultation and short-term care (1–2 visits) to assist PCPs.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Evaluation of the program is ongoing, and will include: 1. PCP surveys to explore use of integrated BH services, confidence in providing care for patients with BH needs, work-life stress, and perception of patient outcomes. 2. Structured PCP interviews to explore themes from survey data. 3. Provider referral counts to BH services. 4. Time-study data for MHCPs. 5. Electronic medical record (EMR) data for screening rates, disease prevalence, care utilization, and clinical outcomes.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): PCP survey data show that 79% reported utilizing BH staff weekly or more than once per week for reasons that included consultation, referral for treatment, and crisis intervention. 100% of PCPs agreed or strongly agreed that clinical outcomes for patients with BH needs improved post-intervention, 92% agreed or strongly agreed that having on-site integrated BH staff decreased personal stress, and 100% of PCPs reported enhanced confidence in caring for patients with BH needs. Over 53% of MHCP time was spent in direct patient care or PCP discussions (not including documentation), and 74% of these direct patient contacts came from PCP referrals. Most patients had mild/moderate symptoms, and the most common condition addressed by the MHCP was anxiety.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): In implementing BH integration programs, primary care practices can anticipate improvement in PCP confidence and decreased stress. Focused attention on building relationships between PCPs and BH team members may help to optimize these programs. Anxiety management may be a symptom particularly amenable to integrated BH team care.

PROMOTING WELLNESS IN PRIMARY CARE PROVIDERS: THE EFFECT OF A WELLNESS COMMITTEE ON PROVIDER SATISFACTION Katherine Small[1]; David Skovran[2]; Trang Vu[1]; Jonathan Ripp[1]; Shanna Levine[1]; Alex Federman[1]; Lauren Peccoralo[3]. [1]Icahn School of Medicine at Mount Sinai, New York, NY; [2]Mount Sinai, New York, NY; [3]Mount Sinai School of Medicine, New York, NY. (Control ID #2704101)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Physician burnout is common and can lead to poor morale, depression, reduced provider retention, decreased productivity and the perception of decrements in care quality.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To assess work satisfaction and burnout in faculty physician (MD) and nurse practitioner (NP) primary care providers (PCPs) at a resident continuity clinic with the goals of identifying areas needing improvement, implementing appropriate interventions and reassessing satisfaction metrics.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Based on the American Medical Association's STEPS Forward program, we formed a committee that composed an anonymous survey (modified Mini-Z, 16 questions, quantitative and qualitative) of faculty at Mount Sinai's Internal Medicine Associates (IMA) to assess satisfaction and gather suggestions for improvement. We then presented survey findings to leadership and devised interventions to address the most relevant issues. We plan to distribute a follow-up survey after the changes to the practice have been implemented.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The baseline data is presented in our findings to date. The quantitative assessment of satisfaction and burnout is presented as descriptive data. The qualitative assessment of the areas needing improvement and suggestions for change is assessed using a grounded theory approach and the main themes are presented.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Overall, 31 PCPs (24 MD, 7 NP) responded to the survey (response rate 77%). On a 1–5 scale (1 = poor, 5 = optimal), the average score in response to the question "my control over my workload" was 3.2. In response to the question "I am satisfied with my current job" 58% (18) PCPs reported that they agree and 19% (6) reported that they strongly agree. In response to what level of burnout is felt, 16% (5) of PCPs reported no burnout, 45% (14) reported stress but no burnout, and 35% (11) reported at least one symptom of burnout. The qualitative answers to identify sources of burnout centered around five main themes: clarification of roles of support staff, improved teamwork, reciprocal feedback between leadership and providers, functional facility infrastructure, and acknowledgement of work not reflected by productivity and patient satisfaction metrics. Since presenting this feedback to leadership, we have begun discussions to address role clarity, helped secure funding for additional administrative support, added computers to teaching areas and added praise boxes to acknowledge colleagues.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The leadership and wellness committee have partnered to implement changes for faculty and staff wellness that are appropriate for our practice. The interventions are limited by funding and resources as well as survey anonymity precluding a paired pre/post analysis. The next steps will be to assess the impact of the interventions on PCP wellness and satisfaction.

PROPP: PATIENT RECALL OF PRIMARY PROVIDER Chirag R. Patel[1]; Daniel Bercik[2]; Austin Brown[2]; Karen L. Mendieta[2]. [1]The Ohio State University Wexner Medical Center, Columbus, OH; [2]The Ohio State University College of Medicine, Columbus, OH. (Control ID #2688242)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Physicians have found marginal success in effectively conveying to their patients that most basic of identifiers, their name.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Improve the hospitalized patient's ability to accurately recall members of their primary inpatient care team.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): IRB approval

was sought and received in order to measure and improve inpatient General Medicine teaching service patients' accurate recall rate of their primary provider. Several exclusions were incorporated to ensure the validity of our data. Ultimately, we found results much lower than expected; as such causal determination was sought. A root cause analysis was undertaken and led to two major initiatives: photo roster card distribution and effective white board use. These initiatives were rolled out and data was collected regarding the primary team members' ability to effectively convey their respective name to the patient. The photo roster card included: team name; physician team member photo, name and role with description; medical student, case manager and social worker name and role with description. Effective white board use was described as listing of primary team member names and their role. The roster cards were distributed and white boards populated during the time of attending physician initial bedside encounter.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): On hospital day 3, the study team visited with patients. Three objectives existed during this encounter, to determine: 1) if white board was used effectively, 2) if a patient received a photo card, 3) the patient's ability to accurately recall members of the primary team.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Our end point was determining accurate provider recall of any member of the primary team. We found a strong statistically significant difference between the group of patients who received a photo card independent of white board use (63%) and those who did not (29%). Additionally, a medium strength statistically significant difference was determined between the group of patients with white board use independent of photo card receipt (79%) and those without use (34%). Lastly, sub-group measurement was done to better understand the impact of both white board use and photo roster card distribution. Although we found a significant difference in recall between the two groups, 87 and 23% respectively, the statistical strength was limited.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Care of an ill patient requires several skills that are not only limited to one's clinical acumen but also include the personal connection developed with the patient. Doctor-Patient communication is a skill that many have developed over their years of training and then practice. At the heart of establishing a connection and developing rapport is the introduction. Our team determined that use of a photo roster card and/or white board use improves a patient's ability to recall a member of their primary team. Additionally, our data supports future determination of the efficacy on patient recall with utilization of both modalities concurrently.

PROTON PUMP INHIBITOR OVERUSE: LEVERAGING TECHNOLOGY TO DEPRESCRIBE

Colin T. Iberti; Clare Whipple; Katherine Small. Mount Sinai Hospital, New York, NY. (Control ID #2674233)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Proton pump inhibitor (PPI) overuse is associated with significant adverse events including increased risk of Clostridium difficile infection, community acquired pneumonia, and hip and spine fractures.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To reduce PPI overuse via systematic deprescribing aided by an electronic medical record tool.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Starting with our first Plan-Do-Study-Act (PDSA) cycle, we educated a team of two internal medicine attendings and 15 residents at the general internal medicine residency clinic of an urban tertiary care hospital regarding the harms of PPI overuse. Clinicians then received automatically generated electronic medical record messages with targeted patients on PPIs, triggering an in-visit prompt designed to quickly and easily assess indications, medical necessity of PPI, and potential to deprescribe. After clinician feedback, the second PDSA cycle refined the required response to the prompt and provided monthly report cards giving feedback on the PPI patients per clinician.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The primary outcome is the percentage of the team's patients on PPIs. The secondary outcomes include tracking the indication for PPI prescriptions to examine what proportion of our PPI use is appropriate. Process measures will include the frequency of use of the in-visit dotphrase prompt out of number of total visits with PPI patients, as well as the number of residents receiving PPI education. Balance measures include utility and ease as measured by team survey and follow-up phone calls with patients regarding symptoms, antacid requirements, or requiring restart of PPIs.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The electronic medical record tool identified 332 panel patients chronically on PPIs; 103 were scheduled for office visits and eligible for the intervention during the six-month study period. Providers used the prompt in 70 of those visits, or 68% of the time. 36 (35%) of the 103 patients scheduled had their PPI discontinued as a result of the intervention. Of the 103 patients chronically on PPIs who were seen during the study period, the prevalence of PPI use decreased from 100% (103 patients) to 65% (67 patients). The most commonly encountered indications for chronic PPI use prior to the intervention were GERD (41.6%), dyspepsia (19.8%), and continued in-hospital GI prophylaxis (13.9%).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): An electronic medical record intervention was successful in identifying PPI overuse, reducing patients on non-indicated chronic PPI therapy, and improved our ability to provide high-value care and prevent potential medication related adverse events.

PUTTING VETERANS F.I.R.S.T. FAILURE INTERVENTION RISK STRATIFICATION TOOL TO REDUCE 30 DAY READMISSION FOR PATIENTS WITH CONGESTIVE HEART FAILURE

Serena M. Ogunwole[1, 2]; Jason Phillips[2]; Patricia Wathen[2]. [1]University of Texas Health Science Center San Antonio, San Antonio, TX; [2]Ut health science center at San antonio, San Antonio, TX. (Control ID #2707659)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Over a million patients are hospitalized for heart failure each year. As many as 25% 1of these patients are readmitted within 30 days of discharge, making CHF exacerbations the most common cause of 30-day hospital

readmission.From a financial standpoint, treatment of CHF is extremely costly: with direct and indirect costs totaling more than 37billion dollars and Medicare spending exceeding 17 billion dollars. Additionally, the shift toward 30-day admission rates as a quality measure has led to increased financial penalties for institutions with the highest readmission rates. Several studies have linked the reduction of 30 day readmission with early (within 7 days) physician follow up after discharge

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Primary aim :increase the number of completed 7 day follow up appointments to 50% for all patients discharged from the internal medicine service with the diagnosis of acute decompensated heart failure by implementing a new discharge order template Secondray aim: reduce readmission rates CHF exacerbations by 20% at our hospital

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): This project was done at an inpatient facility at the Veterans Administration hospital Proposed interventions: 1. Through literature review and consultation with a heart failure specialist we determined criteria for a high risk heart failure patient. Once these patients were identified, targeted interventions were given to them; including follow up with a CHF specialist. 2. We created a mandatory order set that populates upon discharge of a patient with a primary diagnosis of CHF: the order set has criteria that will enable internal medicine residents to risk stratify patients at high risk for CHF readmission. Patients identified as high risk for readmission will have follow up in the CHF clinic with a heart failure specialist. Patients who are not deemed high risk by the criteria will have follow up with a provider who can change medications. Regardless of who the patients follow up with, ALL follow up appointments will be placed within 7 days of discharge. This order set will auto-populate a clerk order to make an appointment with the appropriate clinic thus streamlining and standardizing the process for follow-up appointments for CHF patients.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 7 day follow up appointment percentage Absolute reduction in annual admission rates

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We decreased the average time to follow up from 17.7 days (October 2014) when the project was implemented to 8.7 days (January 2015) Percentage of patients readmitted within 30 days post-discharge at baseline, and following intervention one(creation of heart failure work group) and two (intensive follow up post discharge) were 25%, 22%, and 21%, respectively.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Identifying high risk patients is a cost effective strategy for utilizing limited resources. Using an electronic medical record as a strategy for enforcing adherence to a protocol is an extremely effective intervention

QUALITY IMPROVEMENT INTERVENTION ON HIGH UTILIZER INPATIENTS ADMITTED TO INTERNAL MEDICINE SERVICES

Samuel O. Schumann[2]; Marc Heincelman[2]; Patrick D. Mauldin[2]; Jingwen Zhang[1]; Justin Marsden[2]; Don Rockey[1]; William P. Moran[2]. [1]MUSC, Charleston, SC; [2]Medical University of South Carolina, Charleston, SC. (Control ID #2706729)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): The top 10% high cost patients, labeled high utilizers (HU), disproportionately consume an exceedingly large amount of acute care resources and the value of this care is questionable.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Identify patients at risk for a HU admission in real time using predictive modeling. 2. Implement a quality improvement guideline intervention directed at patients identified as high risk for a HU admission to reduce low value inpatient care, primarily focusing on reducing length of stay.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): A quality improvement guideline intervention study was performed on all patients > 18 years old admitted to internal medicine services from October 1st, 2015 - April 11th, 2016. An established predictive model (AUROC = 0.80) was used to analyze admission variables and identify patients at risk for a HU admission in real time. A predictive model estimator score of ≥ 0.15 was used to define patients at risk for a high utilizer admission, giving the model a sensitivity of 55 and specificity of 84%. An estimator score of ≥ 0.15 was also projected to identify 2 patients per day at risk for a HU admission, which was a patient volume appropriate for the scope of the intervention. Certain patients meeting pre-specified criteria were excluded from the study, such as new solid organ or bone marrow transplant recipients. Patients with a HU estimator score ≥ 0.15 and not excluded were enrolled in the study and received intervention in three areas: early palliative care consultation, early pharmD medication reconciliation, and recommendations to follow Choosing Wisely guidelines for lab tests, chest x-rays and blood transfusions. The top 10% high cost patients admitted to internal medicine services from July 1st, 2013 - June 30th, 2014 were used as the comparison group.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Primary outcome was a reduction in length of stay. Secondary outcomes included pharmaceutical charges, laboratory charges, total hospital costs and discharge disposition.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 373 patients were identified by the predictive model as being at risk for a HU admission (1.92 patients were identified per day). 130 patients were enrolled in the quality improvement guideline intervention and received all 3 areas of intervention (early palliative care, pharmD medication reconciliation and choosing wisely education). 243 patients were excluded. In the comparison group 7,571 patients were admitted to internal medicine services and 757 were the top 10% high cost patients. The mean LOS for HU patients enrolled in the guideline intervention was 10.3 days compared to a historical mean LOS of 25.4 days (*P* value 0.0183). The median LOS for HU patients enrolled in the guideline intervention was 6.1 ± 13.2 days, compared to a historical median LOS of 19.5 ± 32.5 days.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Patients at risk for a high utilizer admission can be identified in real-time based on admission variables. Guideline based interventions can then

be deployed early in an admission to improve the value of care and decrease length of stay

REDUCING CENTRAL VENOUS CATHETER RATES USING AN ULTRASOUND-GUIDED PERIPHERAL INTRAVENOUS CATHETER SERVICE

Benjamin T. Galen; William Southern. Albert Einstein College of Medicine, Bronx, NY. (Control ID #2692713)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Central venous catheters (CVC) may be used in patients with difficult venous access on medical wards, but carry risk of complications including infection, thrombosis, pneumothorax, or arterial injury.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) To assess the impact of an ultrasound-guided peripheral IV (USGPIV) service on the rate of newly-placed CVC on an inpatient unit 2) To assess the acceptability and perceived benefit of this service by nurses

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The traditional technique (using manual palpation) of placing a peripheral IV is successful in most cases. However, when the traditional method fails, a central venous catheter may be placed to maintain intravenous access. Because CVCs are associated with complications, we tested the effectiveness of an ultrasound guided peripheral IV service to reduce the number of newly placed CVCs on an inpatient ward. We hypothesized that an USGPIV service would reduce the incident CVC rate on an intervention unit compared to a similar unit without this service. In this quality improvement initiative on an inpatient ward, providers activated the USGPIV service bundle when their patient's IV access was lost, insufficient, or expired and IV placement by the traditional technique (typically 3 attempts) was unsuccessful. The procedure team then placed at least one USGPIV in an upper extremity using a portable ultrasound device (GE V-Scan Dual Probe) and standard sized IV catheters.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The primary outcome measure was the number of newly placed CVCs on the intervention vs. control unit. Additional measures included a survey of the patients' nurse (at the time of IV placement) examining the intervention's acceptability and benefit to patient care.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We found a significant reduction in the rate of newly placed CVC on the intervention unit compared to the control unit at 90 days: mean 0.47 vs. 0.67 newly-placed CVC/day ($p = 0.048$) We also found that 93% of nurses surveyed reported that the USGPIV service prevented delays in patient care. In addition, 73% of nurses reported that if an USGPIV service was not available, that a CVC would have been required for their patient. Furthermore, 80% of nurses felt that their patient preferred an USGPIV to the traditional technique and 100% agreed that an USGPIV service should be made permanently available on their unit.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): An ultrasound-guided peripheral IV service appears to be an effective tool for the inpatient medical ward to reduce central venous catheter utilization. An intervention using a portable ultrasound and standard IV equipment was also found by nurses to be acceptable and beneficial to patients.

REDUCING THE BURDEN OF QUALITY IMPROVEMENT THROUGH THE ABMS MAINTENANCE OF CERTIFICATION PORTFOLIO SPONSOR PROGRAM

Sandhya K. Rao[2]; Suzanne M. Turner[3]; Timothy G. Ferris[1]. [1]MGH, Boston, MA; [2]Massachusetts General Hospital, Boston, MA; [3]Massachusetts General Physicians Organization, Boston, MA. (Control ID #2705621)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Many different stakeholders, including Center for Medicare Services (CMS), commercial payers, Joint Commission, state licensure boards, and the American Board of Medical Specialties (ABMS) require physicians to engage in separate practice improvement activities which contributes to administrative burden among physicians.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Enable physicians to meet multiple requirements through their on-going institutional and departmental quality improvement projects.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The ABMS Multispecialty Portfolio Sponsor program enables instutions to approve local quality improvement efforts for MOC Part IV credit. The Mass General Physicians Organization enrolled in the Portfolio Sponsor Program in 2012. We established a quality review committee to review projects to ensure they were designed and executed according to the requirements of the program. In 2014, we enhanced the value of the program by obtaining Continuing Medical Education credit for physicians who earned MOC credits. Each participating physician is now eligible to earn up to 20 CME credits for their partcipation in a project in addition to MOC part IV credits.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1. Number of projects submitted 2. Number of physicians earning CME and MOC Part IV credits 3. Estimated hours saved for physicians through alignment of requirements. (Assumes 10 hours per physician per MOC Part IV effort if completed on his or her own)

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Approved QI projects: 2012: 18 2013: 24 2015: 31 Physicians earning credit 2012: 117 2013: 192 2014: 507 2015: 705 Esimated Hours Saved: 2012: 1170 2013: 1920 2014: 5070 2015: 7050

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1. It is possible to earn MOC through local QI work. 2. Aligning projects to multiple requirements reduces physician administrative burden and saves time 3. Physicians need support in crafting projects to meet requirements, a MD champion with knowledge of their board requirements and administrative support to design and organize projects accordingly. 4. Leadership should design QI projects to support multiple requirements to allow for the largest number of physicians to earn credits and meet institutional requirements.

REDUCING THE NUMBER OF LABORATORY ORDERS IN A TERTIARY ACADEMIC FACILITY: A QUALITY IMPROVEMENT STUDY Rachna Rawal[2]; Oluwasayo Adeyemo[2]; Jennifer Schmidt[1]. [1]Saint Louis University, Saint Louis, MO; [2]St. Louis University, St. Louis, MO. (Control ID #2706336)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): High prevalence of over-testing in academic medical centers due to lack of cost awareness and discussion among resident teams.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Reduce unnecessary daily labs among resident housestaff 2. Raise resident awareness of lab costs 3. Encourage discussion of cost-conscious lab testing

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The cost of health care is significant. Reducing unnecessary lab testing would decrease cost. In this study, we focused on residents rotating on the inpatient medicine service at an academic hospital servicing a large, urban population. Interventions targeted knowledge of daily lab ordering practices, including ordering rational. Resident experience discussing daily labs with their team and their global perspective on the physician's role in cost conscious medicine were addressed. The first intervention included educational presentations at resident conferences, team room posters, weekly informational emails, and monthly emails to alert attending physicians about the project. Future interventions include modification of conference presentations and Epic SmartSet changes.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We collected data on the number of basic metabolic panels (BMPs), comprehensive metabolic panels (CMPs), complete blood count with and without differential (CBC w/diff, CBC w/o diff) over the course of a four-week period (both at baseline and after each intervention). Additionally residents completed a survey before and after the intervention with multiple choice, free response and Likert scale questions (anchors 1 = never, 5 = always).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): After the initial intervention, we saw a non-significant decrease in CBCs w/diff and an increase in CBCs w/o diff. BMPs and CMPs ordered did not change. Baseline survey showed 88% of residents feel unnecessary lab ordering occurs at our institution. While 82% of residents feel it is their responsibility to consider lab cost, only 67% of residents actually do. 50% of residents never or rarely wait for admission lab results prior to placing additional lab orders. While these values did not change significantly after the intervention, significantly fewer residents stated they ordered daily CBCs if a patient had a normal admission CBC ($p = 0.019$). Post intervention results showed a significant increase in residents discussing lab ordering with their team, 50% to 100% ($p = 0.028$).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our study confirms that residents are aware of unnecessary lab testing and feel they should consider testing cost; it also confirms that while residents feel this way, their actions do not consistently follow suit. We believe that the majority of our effect came through increasing awareness of testing costs and practices; we also believe this will be the most sustainable result moving forward. Anecdotally, some residents were unaware that a CBC could be ordered without a differential or that it was possible to order only a specific electrolyte rather than a full BMP. Basic education on lab cost as well as encouraged discussion within the resident team require relatively minimal labor but show significant results.

SBOT: A SHELTER-BASED OPIOID TREATMENT PROGRAM Avik Chatterjee[1, 2]; Aura Obando[2, 3]; Erica Strickland[2, 5]; Ariana Nestler[2, 6]; Terri LaCoursiere-Zucchero[2, 4]. [1]Harvard Medical School, Cambridge, MA; [2]Boston Health Care for the Homeless Program, Boston, MA; [3]Harvard Medical School, Boston, MA; [4]University of Massachusetts-Worcester, Worcester, MA; [5]Northeastern University, Boston, MA; [6]Tufts University School of Medicine, Boston, MA. (Control ID #2698947)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): The opioid epidemic has brought significant morbidity and mortality, particularly among homeless individuals, but to our knowledge no shelter-based treatment for opioid addiction exists.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To evaluate the successes and challenges of a novel family shelter-based opioid treatment (SBOT) program in its first year.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): A family outreach team at our Community Health Center has treated patients facing homelessness in diverse settings since 1985. Between 6/2015-6/2016, the team took care of 669 adults and 405 children. Prevalence of OUD in our patients during that time was 6%. Office-Based Opioid Therapy (OBOT) works for homeless adults as well as it does for housed adults. But homeless adults in families have unique barriers to OBOT including transportation and childcare needs. Our team of a physician, a nurse, case managers, and a therapist works in a twice-a-week outreach clinic at a 120-room family motel-shelter and regularly encounters patients with opioid use disorder. In 2015, our team developed SBOT. Features of SBOT include on-site induction, weekly group or individual therapy, regular urine drug testing and medication counts, intranasal naloxone training, medication lockboxes, and employment, housing and family support.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We reviewed the charts of patients who started SBOT from 8/2015 to 8/2016. We reported patient demographics and co-morbidities. We used Chi-squared tests to compare overdose history, urine drug test results, and employment at the beginning of and during treatment. We also reported reason for leaving the program.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We started 10 patients on SBOT in our first year. Six were women and 6 reported white race. Mean age was 35 (range 32–40) and median number of children was 2 (range 1–5). Thirty percent had a history of illicit oral opioid use only, 20% had a history of heroin use only, and 50% had a history of both. Half tested positive for hepatitis C and none for HIV. All had anxiety and 70% had depression or bipolar disorder. Mean time in SBOT was 7.4 months (range 3–12 months). Four patients had experienced overdose before SBOT, but none did during SBOT ($P < 0.01$). In the first month of treatment, 77% of urine drug tests showed controlled substances, compared to

51% in the third month ($P < 0.01$). In their final month of treatment, 3 patients reported being employed, compared to 1 at the beginning ($P = 0.04$). After the review period, 4 continued SBOT, 5 moved out of the shelter and transferred care elsewhere, and 1 left the motel and did not continue agonist therapy. Two patients relapsed after leaving the shelter and lost custody of their children.
KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Shelter-based opioid treatment—SBOT—helped a diverse group of vulnerable adults access treatment. An inter-professional team and the ability to send labs contributed to our success. A significant challenge was transitioning care once patients left the shelter—access to OBOT in the community is limited, and requires solving transportation, childcare and other issues SBOT helped patients overcome.

SCREENING FOR DIABETIC RETINOPATHY IN PRIMARY CARE USING A HAND-HELD RETINAL CAMERA Carolyn F. Pedley[1]; Ramon Velez[1]; Claudia L. Campos[2]; James L. Wofford[2]; Darius Wilson[2]; Angela Smoak[2]; Dobson Latanya[2]; Delois Samuels[2]. [1]Wake Forest, Winston-Salem, NC; [2]Wake Forest University, WInston-Salem, NC. (Control ID #2706773)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Diabetes is the leading cause of acquired blindness in adults. Diabetics with limited access to health care are not properly screened for eye disease.
OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. To provide effective screening for diabetic retinopathy in a population with limited accesss to health care 2. To screen for retinopathy during routine provider visits 3. To coordinate retinal screening with specialists able to provide eye care
DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): A safety net clinic staffed by an academic institution employed a hand-held Zeiss Visuscout 100 Retinal Imager camera to take retinal images of diabetics' eyes over a 3 1/2 month period. Pictures were taken in a procedure room in the clinic by nurses after the patients' clinic visits. Each eye was photographed without dilation and the images were transmitted by a TreVia portable tablet device to be read by Ophthalmology in the medical center. Picture quality could be assessed on a camera monitor before transmission and photographs could be retaken if necessary. Patients and providers received paper and electronic reports and recommendations based on the readings. The patients to be photographed were highlighted in the clinic schedule as they came in for regular visits.
MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1. Number of diabetics screened 2. Clarity of images for reading 3. Nursing time involved 4. Effective communication among patients, providers and ophthalmologists
FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 51 diabetic patients received retinal photographs in the 3 1/2 month period. 95% of the photographs were interpreted as being adequate for reading although 21% had to be repeated. 18% of the photographs recommended that the patients see an Ophthalmologist for further evaluation and treatment. Nurses required 20–40 min per patient depending on the ease of taking the images.
KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A hand-held retinal camera employed in a busy medical clinic is an effective tool for improving diabetic eye screening rates. The hand-held camera is easy to operate and training is not very difficult. Not dilating pupils adds to the comfort and safety of patients. The TreVia tablet system also proved to be effective in transmitting images and sending results and recommendations to providers and patients. The main barriers to increasing the screening numbers was the time needed by the nurses to take and transmit the images. In a busy practice individuals taking such images would have to have dedicated time.

SERVICE-LEARNING PROJECT IMPROVES HEALTH LITERACY VIA STEM CURRICULUM IN BRONX NY ELEMENTARY STUDENTS Andrew Johnston; Kim Ohaegbulam; Rohan Biswas; Kevin Shieh; Alicia Philippou; David Liao; Tonya Aaron; Liane Hunter; Aldemar Guzman; Elizabeth Fruchter; Maria Marzan; Christopher Phang; Judith Wylie-Rosett. Albert Einstein College of Medicine, Bronx, NY. (Control ID #2708035)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): By engaging in health and STEM education awareness, can healthier lifestyle habits of Bronx youth be obtained through a medical student driven service-learning program?
OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Evaluate attitudes, habits, beliefs, and familial influences of youth that impact scientific curiosity and health awareness 2. Identify factors that demonstrate a relationship between STEM education/ interest and health literacy 3. Quantify the impact of the intervention on improving health literacy and STEM interest.
DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Through a partnership with the South Bronx Police Athletic League after-school program, volunteers from Hoops for Health, a community based service learning program of the Albert Einstein College of Medicine, administered its innovative curriculum, mentored fourth and fifth grade students, and assessed the relationship between STEM education and health literacy. On a monthly basis during the 2015–2016 academic year, Hoops for Health volunteers conducted one forty-five minute session dedicated to modules in STEM education and health promotion and another forty-five minute session devoted to physical fitness and nutrition counseling.
MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): A survey was given to the students at the start and end of the program to identify significant factors relevant to health and science promotion, along with a nine-item feedback survey to evaluate the program. Using this data, we examined the objectives of our program.
FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We found that students, who identified as having math or science as their favorite subject, not only liked science more, but also participated in physical activity more frequently during the week. Furthermore, we show that students in our program with parents in a STEM-related field practiced healthier lifestyle habits and displayed more health awareness.

Students rated our program highly, noted that they learned new concepts in health and science, and favored our hands-on modules.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Since household background is a critical component in fostering lasting healthy lifestyles, creating events and programs aimed at promoting health education to both parents and children should be prioritized. Also, creating strong relationships between after-school programs (Police Athletic League, Boys and Girls club, YMCA, etc.) and local medical/graduate schools is an easily accessible avenue to disseminate health and STEM awareness information as well as establish a forum with the community to better assess their needs. Furthermore, we make our curriculum available to facilitate the establishment of other positive learning environments.

SHARING THE LOAD: THE EFFECTIVENESS OF INVOLVING A NON-CLINICAL TEAM MEMBER IN DIABETES GROUP EDUCATION AND SUPPORT Melanie Martin[1]; Feben Girma[2]. [1]Wake Forest, Greensboro, NC; [2]Wake Forest Baptist, Winston-Salem, NC. (Control ID #2706371)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Patient engagement is crucial for improved outcomes in diabetes and can be enhanced by use of a non -clinical team member to provide disease education and support, even in a challenging patient population.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1.Describe a diabetes education/support course that can be led by a trained non-clinical team member. 2.Provide evidence of improvement in glycemic control via measurement of participants' Hemoglobin A1c through this program.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Care Plus is a multidisciplinary outpatient program that provides primary care and care coordination to frequently admitted patients from safety net practices at Wake Forest Baptist Health. Fifty percent of the patients enrolled in Care Plus have diabetes, and most have multiple other comorbid conditions along with significant psychosocial challenges. Effective treatment of Type 2 Diabetes Mellitus requires lifestyle changes along with medication adherence. Adequate instruction on the causes, consequences and treatment of diabetes can be challenging in a resource limited practice. We explore the benefits of training a non-clinical patient navigator as a peer diabetes educator. This educator was trained in the Diabetes Empowerment Education Program under Alliant Quality, a Quality Improvement Organization under Centers for Medicare and Medicaid. Weekly diabetes education support groups are conducted following the Alliant Quality 6–8 week curriculum.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We compare individual pre and post participation HgbA1c results during the program. Patient satisfaction survey regarding the program is forthcoming.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Fifteen Care Plus patients with DM II attended at least half of the curriculum and are included in this study. Seven of these patients chose to attend the program multiple times as they found it to be engaging and helpful. For patients that chose to participate repeatedly, we compared their results prior to enrollment of their first session to their results after completion of their last session. The group average HgbA1c prior to enrollment was 10.1 (range 7.1- 13.7) and the group average HgbA1c after completion was 9.0 (range 7.1- 12.2). The average improvement in HgbA1c was 1.1. Individual results ranged from worsening by 0.5 to improvement by 3.4. Although the changes cannot be attributed to this intervention alone, the group education and support enhanced patient engagement.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Effective diabetes education is time consuming and can be especially challenging for clinics with limited resources serving uninsured and under insured patients. The lifestyle changes and importance of medication adherence are paramount to improving glycemic control. Training a non-clinical team member as a Peer Educator in the Diabetes Empowerment Education Program has proven to be an effective way to engage patients and provide diabetes education, resulting in HgbA1c improvement.

SLEEP IS VITAL: IMPROVING SLEEP BY REDUCING NOCTURNAL VITAL SIGNS Elaine C. Khoong[2]; Hana Lim[2]; Timothy Judson[2]; Kelly Johnson[2]; Nicole Kim[2]; Karen Bieragual[2]; Jin Ge[2]; Priya A. Prasad[1]; Kyle Tillinghast[3]; Catherine Lau[3]; Michelle Mourad[3]. [1]UCSF, San Francisco, CA; [2]University of California - San Francisco, San Francisco, CA; [3]University of California, San Francisco, San Francisco, CA. (Control ID #2705849)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Hospitalized patients get fewer than five hours of sleep a night, and poor sleep leads to increased rates of delirium, falls and hypertension as well as decreased patient satisfaction.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. To improve sleep among hospitalized patients by minimizing nighttime disruptions and increasing housestaff awareness of their role in promoting sleep. 2. To ensure the intervention does not compromise patient safety

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): This project was conducted at a tertiary care academic hospital. We included patients on the hospital medicine service who were discharged from an acute or step-down unit. In our baseline needs assessment, hospitalized patients reported nighttime disruptions, including vital signs, were a common cause of sleep disturbance. At baseline, 15% of patients at our hospital were discharged on sleep promotion vital signs (VS), defined as any VS less frequent than every four hours. Our goal was to increase the rate of patients with sleep promotion VS 24 hours prior to discharge to 45%. To ensure continued patient safety, we tracked rapid response calls and intensive care unit (ICU) transfers for the hospital medicine teaching service. Housestaff led a yearlong project that included interventions - including provider and nursing education, audit and feedback, and electronic medical record (EMR) changes - aimed at decreasing nocturnal VS checks for stable patients. We provided education at monthly resident orientations and encouraged housestaff to order sleep promotion VS on patients with stable VS for 24 hours and no anticipated medical changes. We provided real-time feedback to each medicine team by emailing a performance dashboard every

two weeks, fostering healthy competition. High and low performing teams were given a brief survey regarding barriers to sleep promotion VS. We created easily accessible "Sleep Promotion Vitals" orders and embedded them into the hospital medicine admission order set and the standard order entry tool.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Our outcome measures were: a) the rate of patients discharged from the hospital medicine teaching service on sleep promotion vitals at least 24 hours prior to discharge; b) the rate of rapid response calls and ICU transfers for our patients; and c) validated measures of sleep quality from patients on sleep promotion versus standard (every 4 hours) VS.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Early results demonstrated an increase in sleep promotion VS from 15 to 55% within six months. We have met our goal (45 + %) for each of the last four months (08-12/2016). There were no recorded adverse outcomes (rapid response calls or ICU transfers) related to decreased nocturnal VS.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Through a multifaceted, resident-driven approach including provider and nursing education, feedback, and EMR changes, we can successfully and safely decrease nocturnal vital signs in hospitalized patients.

STANFORD'S PRIMARY CARE 2.0: INTENTIONAL LEAN DESIGN OF A QUADRUPLE-AIM-BASED PRIMARY CARE TRANSFORMATION ALTERNATIVE TO THE PATIENT-CENTERED MEDICAL HOME Garrett Chan[1]; Rumana Hussain[3]; Marcy Winget[1]; Cati Brown-Johnson[1]; Jonathan G. Shaw[2]; J A. Glaseroff[1]; Megan Mahoney[1]. [1]Stanford School of Medicine, Stanford, CA; [2]Stanford School of Medicine, S, CA; [3]Stanford Health Care, Stanford, CA. (Control ID #2699102)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Systematic reviews of patient satisfaction, utilization, cost, and provider outcomes associated with the Patient Centered Medical Home (PCMH) have been inconclusive, showing only modest improvements across all the domains; as an alternative, an intentional "Lean" (continuous improvement) design approach could lead to more profound improvements.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): In 2016, Stanford Healthcare undertook the goal to develop a new model of primary care specifically directed at meeting the Quadruple Aim. Facility and care models were designed using Integrated Facility Design, ie. Lean 3P Design. This design approach was an adaptation of Toyota 3P (Production, Preparation, Process) employing a team-based process design with representation from all relevant stakeholder groups to achieve a design that promoted high quality care, reduction of waste, and patient and employee satisfaction.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Design activities spanned 18 months and included local consumer research (22 interviews); site visits (9 sites, 33 participating stakeholders); and visioning sessions. Notable features of the core Primary Care 2.0 model included: (1) three Physician (MD) and Advanced Practice Provider (APP) pairs, caring for 10,000 patients; (2) 3,330 patients empaneled to an MD-APP pair and four care coordinators (CCs) in each team; (3) embedded extended care team relevant to primary care, namely clinical pharmacist, dietitian, behavioral health specialist, nurse, and physical therapist.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1. Survey sent to SHC stakeholders who had any involvement in the design process, assessing feasibility and acceptability of the design process. 2. Survey sent specifically to Design Team members. This open-ended survey focused on group composition and dynamic on the creation of a multidisciplinary team-based model.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Lean Integrated Facility Design was appropriate and acceptable to stakeholders, who created a full care model based on the Quadruple Aim. 77% of respondents reported that they strongly believed the design process was valuable. Notably, no respondent selected neutral or negative rankings for questions related to the design process. In the comment sections, respondents described an effective team, leadership, and collaborative experience. Themes from the second survey included the importance of team building activities in promoting a psychologically safe and effective group process and the role of the multidisciplinary composition of the design team in creating a multidisciplinary care model for PC 2.0.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Lean Integrated Facility Design can be adapted to primary care redesign by focusing multidisciplinary teams on sequential design processes. Diverse stakeholders' perspectives promote a final blueprint that reflects diverse constituents and promote overall buy-in. Time spent in "soft-skill" teambuilding is valuable for promoting group efficacy in designing new primary care models.

SYRIAN CRISIS: AN INNOVATIVE SANITARY RESPONSE IN SWITZERLAND Jeremie Blaser1; Ioana Hincu[1]; Brigitte Pahud-Vermeulen[1]; Mario Gehri[2]; Joan Carles Suris Granell[2]; Patrick Bodenmann[1]. [1]Vulnerable Population Center, Lausanne, Switzerland; [2]Children's Hospital, Lausanne, Switzerland. (Control ID #2701429)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): The Swiss government started a resettlement program, in collaboration with the United Nation High Commission on Refugees (UNHCR) to facilitate the arrival of particularly vulnerable refugees from Syria, which brings the need of a dedicated healthcare program.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) To provide the necessary healthcare for this particularly vulnerable population. 2) To gather information about this population, in terms of medical conditions, but also from a more holistic view of the families, as we know they are selected on vulnerability criteria. This can be used as a feedback to the health authorities about the specific needs of this population. 3) To offer a protection to the medical staff against compassion fatigue through an interdisciplinary consultation, as repeated exposition to the traumatic history of most of these families can be difficult to bear.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Around 1800 persons are expected to arrive in Switzerland between 2016 and 2017 from the resettlement program. In the canton of Vaud (10% of the general population), an interdisciplinary family consultation was set up for those families, staffed with a pediatrician, a general practitioner, an interpreter, as well as a nurse practitioner. At the first consultation, a health assessment is provided to the whole family at the same time. Vaccinations are proposed and screening for tuberculosis is planned for children systematically. Patients can then be oriented toward different medical specialties as needed. A second consultation is planned two months later for a clinical follow-up, to pursue the vaccination plan, and to discuss the results if tests were performed. A shared meeting with the whole medical team concludes the assessment. After this 2nd consultation, a follow-up with a private general practitioner and/or pediatrician is organized.
MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1) Feasibility will be assessed by the number of consultations provided. Medical conditions of the patients will be reported as the number of chapters from the ICPC-2 classification (classification of symptoms and medical conditions for primary care) concerned by the complaints of the patients 2) Vulnerability will be assessed with a validated vulnerability scale. 3) Protection against compassion fatigue will be reported as the absence of compassion fatigue in the medical team.
FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 1) Between July and December 2016, 60 persons have been seen for a first medical evaluation, including 32 adults and 28 children. The adults had on average complaints concerning 3.1 chapters of the ICPC-2 classification, and children 1.3. 2) With the use of the vulnerability scale: 2 adults were identified with 4 axes of vulnerability and 3 with 3 axes. One child was identified with 3 axes. 3) No compassion fatigue has been reported so far.
KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The interprofessional model of a consultation for Syrian migrant families is feasible. The complementarities of the actors are a good protection against compassion fatigue that may threaten the staff.

TEACHING WHEN YOU CAN'T SPEAK: LEADING SHARED MEDICAL APPOINTMENTS (SMAS) FOR LINGUISTIC MINORITIES
Cynthia Schoettler; McShane Michael; Nihan K. Cannon; Kelly Pereira; Yamini Saravanan. Cambridge Health Alliance, Cambridge, MA. (Control ID #2698752)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Shared Medical Appointments (SMAs) have been shown to be an effective way to teach self-management, improve measures of control and increase patient self-efficacy for chronic illnesses using a less hierarchical, culturally focused context; however non-English speakers are often excluded from this intervention due to limited provider linguistic capabilities, despite evidence showing medical interpreters can help overcome language barriers.
OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The objectives of this Quality Improvement (QI) project were to 1) Pilot SMAs for non-English speakers when providers do not share the same language, 2) To understand if SMAs using medical interpreters could be successful and effective for this population, and 3) Establish best-practices for this type of SMA.
DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The Primary Care Center (PCC) of Cambridge Health Alliance is an urban safety-net, Harvard Medical School-affiliated community outpatient clinic that serves a culturally and linguistically diverse patient population, including a large Portuguese-speaking population. A monthly series of 10 SMAs for Portuguese speakers with Diabetes Mellitus was created. SMAs are led by a multidisciplinary team including (non-Portuguese speaking) resident and attending physicians, 2 Portuguese interpreters, and 1 Portuguese-speaking medical assistant. SMAs follows the same format: Pre-visit team huddle to discuss flow, content/plan, methods of interpreting; 30 min of 1:1 brief diabetes-focused patient visits for focused exam and individualized management (1 physician:1 interpreter); 60 min for group discussion (led by physicians and facilitated by both interpreters); End-of-visit team de-brief reviewing all elements of the SMA. This roughly follows the traditional QI format of continuous Plan, Do, Study, Act (PDSA) cycles.
MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): To understand the impact of using medical interpreters in groups, effects will be followed in 3 main areas: traditional measures of diabetes control (i.e. A1c), patient perceptions (via focus groups), and provider (especially interpreter and medical assistant) feedback to identify successful elements and best practices. Focus groups will take place midway (early 2017) and after completion of the series.
FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Thus far, patients have demonstrated good attendance and are very involved in asking questions. Facilitators focus on interactive group dynamic that encourages peer teaching. Interpreters use "simultaneous" translation method to reduce the need to pause for interpretation, which allowed for lively conversations and education, and ability to address cultural perceptions of diabetes such as, "diabetes is caused by stress".
KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): It is possible to develop and lead effective SMAs in languages other than English, if group leaders partner with strong in-person interpreting services.

TEAM FACECARDS IMPROVE PATIENT IDENTIFICATION OF PHYSICIANS BUT HAS LITTLE IMPACT ON PATIENT SATISFACTION
Ernie L. Esquivel[2]; Michael Ding[2]; Nancy Tray[2]; Laura F. Gingras[1]; Arthur Evans[2]. [1]New York Presbyterian Hospital - Weill Cornell Medical Center, New York, NY; [2]Weill Cornell Medical College, New York, NY. (Control ID #2703724)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Caring for patients in the hospital requires the efforts of many health care providers, but several studies have highlighted that most inpatients are unable to identify the physician(s) responsible for their daily management.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): We evaluated the effect of a healthcare team identification tool, team facecards, on provider identification, patient perceptions of physician communication, and patient satisfaction.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): A prospective study was conducted to evaluate the efficacy of team facecards among patients admitted to inpatient teams at NewYork-Presbyterian Hospital. Team facecards were designed to include a photo of each physician member of the primary care team and descriptions of their roles. Patients in the intervention group were provided a team facecard at the beginning of their hospital stay by a non-physician research assistant, and a second team facecard was posted in the room. Patients in the control group did not receive the team facecards.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): After one to two days, patients were asked to identify one of their providers and to answer dichotomized questions adapted from the ABIM-PSQ, addressing the provider's communication skills including use of non-medical jargon, honesty in answering questions, investment in patient well-being and recovery, explanations of diagnosis, treatment, and listening skills.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): During an eight-week study period, a total of 328 team facecards were distributed. Of these, 231 patients could be surveyed since 97 patients were either discharged or transferred to the ICU. A total of 166 (71.9%) agreed to be surveyed while 202/243 controls (83.1%) participated in the survey. Patients who received team facecards could correctly name one of the physicians in 41/166 (24.7%) cases, while another 62 (37.3%) pointed to the card when asked to identify their team. In the control group, only 57/202 (28.2%) could identify a member of the team. The majority of patients in the intervention group 142/166 (85.5%) found the facecard helpful, while 175/202 (86.6%) control patients thought that it might have been useful to receive a team facecard. Patients in the intervention group were significantly more likely to state that their doctors explained their diagnosis and treatment in an understandable way 94.6% vs. 88.1% ($P = 0.03$). Trends toward significant difference ($P = 0.09$) were also noted in patient's perception that their doctors used language that was easy to understand, were honest in answering questions, and communicated better during the physical examination if they had received a team facecard. No significant differences were noted in six other questions of patient satisfaction, with favorable responses obtained in more than 80% of cases.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Team facecards helped patients identify a member of their physician care team, and were perceived positively by patients who received them. However, responses to patient satisfaction questions in both groups were generally favorable and team facecards had only minimal impact on improving these responses.

TELE MONITORING OF PATIENTS WITH UNCONTROLLED HYPERTENSION- A PROPOSAL FOR POPULATION HEALTH MANAGEMENT Charles Choi[1]; Matthew Wilson[1]; Jason Hopper[1]; Elizabeth Tysinger[1]; Kristy Marvin[1]; Deanna Jones[2]; Claudia L. Campos[1]. [1]Wake Forest University, WInston-Salem, NC; [2]Wake Forest Baptist Health, Winston Salem, NC. (Control ID #2706363)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Acces to care is another barrier to achieving blood pressure control in under represented minorities.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The objectives of this pilot intervention are to determine (1) the feasibility (medication side effects, acceptability, recruitment, retention, adherence to protocol) and (2) the effect on BP at 3 months of home BP telemonitoring and use of protocols lead by a nurse practitioner in patients with uncontrolled hypertension of the internal medicine clinic.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We propose to implement a tele monitoring system using home blood pressure measurements via phone transmission. It differs from clinic-based care through the systematic use of home BP tele monitoring and telehealth care coordinated by a nurse practitioner.BP protocols will be used for medication titration..

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The outcomes are (1) treatment side effects, acceptability, self-monitoring rates, medication and protocol adherence. The secondary outcomes are (1) BP control to <140/90 at 3 months and (2) change SBP and DBP at 3 months. Side effects will be elicited during phone visits (Appendix B), self -monitoring rates will be recorded on HBPM device and compared to paper recordings. Medication adherence will be assessed using the medication adherence (Morisky Medication Adherence) Scale during the initial and final visits. We will measure patient acceptability of HBPM using the questionnaire by Lindroos during the final visit. Protocol adherence will be monitored by assessing if patients do comply with measurement times (4 measurements per week for 3 months) and if phone communicated measurements are consistent with recorded numbers. Patient drop outs before the end of the study will be monitored. We will define "out-of-window" visits when more than 7 days from originally scheduled visit have elapsed.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A cross sectional study through an EHR query between 04/17/2016 and 10/17/2016 revealed that among 1833 patients seen at OPD, a third (691/1833) have suboptimal BP control (SB$P > 140$ or DBP >90). One investigator (C Choi) randomly selected 30 charts during that time period of patients scheduled for a BP check with a nurse for uncontrolled hypertension and performed a chart review. Patients were 12 Male and 18 Female, ages ranging from 26 to 74 years old (mean 57) and predominantly AA (20/30). Initial office mean BP was 172/90 and subsequent nurse visit mean BP was 158/82. 5 patients had private insurance, 9 patients were uninsured, 13 Medicare and 3 Medicaid recipients. Nurse follow up visit no show rate was 27% (8/30). The average number of BP medications per patient was 2.5 and the average number of total medications was 9.2 (range 1 to 22).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Changing our practice patterns towards patient centered and population management interventiosn are imperatives in achieving better healthcare outcomes

THE 4:2 ON/OFF SERVICE MODEL FOR AMBULATORY PRECEPTING: AN INNOVATIVE SOLUTION TO MAINTAINING RESIDENT-ATTENDING-PATIENT CONTINUITY Melissa S. Lee[1, 2]; Andrew A. Chang[1, 2]; Moses Lee[1, 2]; David Stevens[1, 2]. [1]Kings County Hospital, Brooklyn, NY; [2]SUNY Downstate, Brooklyn, NY. (Control ID #2707561)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): The shift to an X + Y system risks disruption of continuity between residents and their patients/preceptors because residents will be precepted by multiple attendings.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To test a scheduling system where ambulatory faculty preceptors “follow” their residents in a 4:2 On/Off Service model. To preserve the resident-patient-preceptor relationship. To avoid faculty burnout as a result of the intervention.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Kings County is a large, urban, academic safety-net institution located in Central Brooklyn. We are the primary care continuity practice site for 36 SUNY Downstate Internal Medicine residents. Firms of 12 residents attend clinic during the 2 week Y block. Preceptors supervise 4 residents. Rather than maintaining the traditional preceptor schedule in which each attending precepts the same half-day each week, preceptors are now “on service” with their residents for 6/8 continuity sessions during the Y block. A swing preceptor covers 2 sessions. Faculty do not precept during the 4 “off service” weeks while their residents are on the inpatient wards.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Maintenance of resident continuity with preceptors and patients, improved resident and faculty satisfaction.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Continuity with a primary care provider is widely accepted as a cornerstone of quality and patient experience. In the 4:2 model where attendings have the same precepting schedule every week, resident continuity with preceptors and patients is limited. Residents have a different preceptor for each continuity session. Had we chosen to maintain current attending preceptor schedules in which each attending precepts once per week, residents would have 25% continuity with their preceptors instead of 75% in our On/Off Service model. This was achieved without increasing the total number of attending precepting sessions. The On/Off Service model did not result in attending burnout due to the loss of balance in their work week as was feared. 83% felt they did not lose a sense of balance in their work week, and felt this model was better than the traditional once weekly paradigm. All faculty reported that the 4:2 On/Off Service model kept them excited about working at Kings County. An unexpected finding disclosed during an informal evaluation process was strengthened relationships and improved resident-preceptor communication around patient care. Continuous conversations with a preceptor over 2 weeks improved patient safety and care as laboratory and imaging results were reviewed and discussed promptly.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): When transitioning to an X + Y system, give strong consideration to an On/Off Service Ambulatory Precepting Model to preserve resident continuity with patients and preceptors and improve resident-preceptor relationships and satisfaction.

THE COMPLEX HIGH ADMISSION MANAGEMENT PROGRAM (CHAMP): DEVELOPMENT AND PRELIMINARY IMPACT ON HOSPITAL UTILIZATION Bruce L. Henschen[2]; Margaret Chapman[1]; Abby Toms[1]; Mckay Barra[1]; Luke O. Hansen[3]. [1]Northwestern Memorial Hospital, Chicago, IL; [2]Northwestern University, Chicago, IL; [3]Amita Health, Chicago, IL. (Control ID #2673887)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Patients who are high-utilizers of hospital-based resources pose unique challenges to medical and psychosocial support networks that our current fragmented health care delivery model is unable to manage.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Reduce hospital utilization and improve clinical outcomes among medical high-utilizer patients. 2. Use intensive case management and care coordination to create a system of care that meets the complex needs of high-utilizers. 3. Partner with patients to develop individualized care plans, promote continuity, and rebuild trusting relationships.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The Complex High Admission Management Program (CHAMP) is a longitudinal, relationship-based care model that consists of two social workers (comprised of 1.5 FTE total), two physicians (0.5 FTE), and a program administrator (0.1 FTE). The EMR alerts providers to CHAMP patients; the CHAMP team provides consistency in care services across the continuum through creation of individualized care plans in collaboration with the patient, acts as a hospital consultation service for their patients when admitted, and provides primary care and care coordination when discharged. Intensive case management and trust building, both with patients and providers, play key roles in identifying and targeting the root causes of high utilization.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We have examined rates of hospital admission among patients enrolled in CHAMP compared to retrospective data prior to enrollment. Through a randomized, controlled trial, we plan to prospectively gather utilization, patient satisfaction and quality of life, and other clinical endpoints.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): As of Fall 2016, 53 patients have been enrolled in CHAMP. Their mean age is 56; 17 (32%) carry a diagnosis of sickle cell disease, although the spectrum of medical and social issues is diverse. In a 6-month follow-up period, patients enrolled in CHAMP experienced a 30.0% decrease in hospital 30-day unplanned inpatient readmissions as defined by Medicare ($p = 0.04$), compared with 6 months prior to each patient’s enrollment. There was also a 29.3% decrease in total hospital admissions and an 11.7% decrease in total number of inpatient bed-days during the study period. Patients self-identified with the CHAMP intervention, and providers from varied settings anecdotally reported improvements in care coordination.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): CHAMP, designed to improve care for high-utilizing patients, is

associated with a significant decrease in inpatient hospital readmissions, total admissions, and days in the hospital in a retrospective pre-post analysis. Key drivers of success have been re-establishing trust and strengthening engagement in both patients and providers. The program is feasible with institutional support and has been promoted by clinicians and other members of health care teams, administrators, and hospital executives. Ongoing and future investigations assessing a broader range of outcomes and looking at long-term outcomes are necessary to demonstrate program effectiveness and sustainability.

THE ED-PACT TOOL: COMMUNICATING VETERANS' CARE NEEDS AFTER EMERGENCY DEPARTMENT VISITS VIA ELECTRONIC MESSAGES Kristina M. Cordasco[1, 2]; Hemen Saifu[1]; Lisa V. Rubenstein[1, 2]; Mana Khafaf[1, 2]; Brian Doyle[1, 1]; Jonie Hsiao[1]; Greg Orshansky[1, 2]; David Ganz[1, 2]. [1]VA Greater Los Angeles Healthcare System, Los Angeles, CA; [2]UCLA, Los Angeles, CA. (Control ID #2702251)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Communication failures between providers are a threat to patient safety. Despite the importance of timely receipt of recommended post-emergency department (ED) care, up to two-thirds of patients discharged from EDs do not receive recommended post-ED care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): We developed, piloted, and formatively evaluated a tool (The ED-PACT Tool) facilitating post-ED communication for patients in six primary care clinics in VA's Greater Los Angeles Healthcare System (VAGLAHS).

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The ED-PACT Tool uses the electronic health record to send messages from Veterans Health Administration (VA) ED providers to patients' VA Patient-aligned Care Teams (PACT) nurses, when patients are discharged home from the ED with urgent or specific follow-up needs.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Before implementation, we assessed readiness to participate in the innovation with ED and PACT leadership interviews and PACT nurse questionnaires. During deployment, we used audit and feedback to monitor adherence with correct use of the tool. We logged all user feedback, tracked all failures (i.e., PACT nurse not acting on a message) and their causes, and used run charts to assess for weekly variations in failures. We audited a random sample of 150 messages to capture types of care needs for which messages were sent. We interviewed leaders in the ED and three PACT clinics about perceptions of the ED-PACT Tool's usability and value, as well as implementation facilitators and barriers.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): In pre-implementation interviews, ED and PACT clinic leadership endorsed improving post-ED care communication as being a priority issue. Nurse care manager pre-implementation questionnaires showed that 23 of 29 nurses were "confident" or "extremely confident" in their ability to use the ED-PACT Tool. Between November 1, 2015 and November 30th, 2016, the ED-PACT Tool was used to send 1630 messages from the VAGLAHS ED to nurses in 48 PACT teams. Care needs included: symptom recheck (55%); care coordination (16%); wound care (5%); medication adjustment (5%); laboratory recheck (5%); radiology follow-up (3%); and blood pressure recheck (3%). On average, nurses successfully acted on 88% of messages (weekly range, 72% - 100%). Reasons for failure included human error, staffing shortages and technical errors. Interviews with ED and PACT clinic leaders revealed that the ED-PACT Tool is perceived to provide substantial benefit for coordinating post-ED care by effectively communicating with patients' PACT nurses. PACT leaders also reported nurse training and "buy-in" facilitated implementation, while insufficient staff posed a barrier.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The ED-PACT Tool facilitates communication between providers during a vulnerable care transition. Primary care nurses can fill an important role in receiving and triaging post-ED care coordination messages. Deployment of similar tools should include attention to the organizational, human and technical factors revealed by our evaluation.

THE HEART OF THE TEAM IN TEAM-BASED CARE: IMPROVING PROVIDER-MEDICAL ASSISTANT PAIRING IN PRIMARY CARE Braden K. Mogler[2]; David Lee[1]; Claire K. Horton[1]. [1]UCSF, San Francisco, CA; [2]University of California San Francisco, San Francisco, CA. (Control ID #2706810)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): While stable pairings of primary care providers (PCPs) and medical assistants (MAs) is a core component of team-based care and can decrease burnout and improve team functioning, achieving stable pairings is a particular challenge in a residency based clinic with many part-time providers.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Assess baseline rate of MA-PCP pairings 2. Identify root causes of pairing discontinuity 3. Implement interventions to improve rate of stable pairings

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Over the past 5 years, our clinic has made major efforts to improve team-based care and create a high-functioning medical home model. Key stakeholders identified discontinuity with MAs (ie, rarely working with their assigned MA) as a core area of dissatisfaction. This low rate of stable MA-PCP pairings was a frequent complaint among providers, and other clinics have described an inverse relationship between rate of stable pairings and burnout. To increase our rate we measured stable pairing rates over time, identified factors contributing to missed pairings, chose a staff champion to oversee scheduling, changed staff scheduling protocols to favor stable pairings, and focused efforts on clinic sessions with greatest opportunity for improvement.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We defined our primary measure of success as a 10% relative increase in stable MA-PCP pairing rates over one year. We also monitored qualitative satisfaction among staff and providers via regular clinic feedback sessions.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Our baseline rate of MAs and PCPs working together in their assigned pairing was 50%. Our first intervention was to

identify a senior MA with a high degree of peer leadership skills as staff champion in charge of MA scheduling and to make teamlet pairing top prioritiy in MA scheduling. With this intervention alone our stable pairing rate improved to 70%. In our second intervention we identified root causes of discontinuity of pairing. These factors included sick calls, difficulty in scheduling MAs for evening clinic sessions, and a cultural bias toward prioritizing attending-MA pairs over resident-MA pairs. We explicitly re-prioritized MA-resident pairings, improved full staffing rates overall, and our current work focuses on improving evening clinic assignments. Provider feedback indicates a high degree of satisfaction with the improved pairing rates, with many providers indicating that this change has improved their clinic experience significantly; MAs express more satisfaction as well.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1. Stable MA-PCP pairings in primary care clinic can decrease provider and staff burnout. 2. While achieving high rates of stable pairings in a residency based clinic is challenging due to the large number of part-time providers, monitoring pairing rates and data transparency can give insight into modifiable factors to increase stability. 3. Identifying a staff champion and prioritizing stable pairings in scheduling can greatly increase rates as well as staff and provider satisfaction.

THE HOMELESS RESPONSE TEAM: PROVIDING CONTINUITY OF CARE FOR HOMELESS PATIENTS Meghan R. Rochester[1]; Erik Rueckmann[2]. [1]University of Rochester School of Medicine and Dentistry, Rochester, NY; [2]University of Rochester Medical Center, Rochester, NY. (Control ID #2702415)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Homeless patients have higher readmission rates and healthcare costs with worse health outcomes.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Improve continuity of care from inpatient to outpatient. Enhance medical student competence in caring for homeless individuals. Reduce healthcare costs associated with the care of homeless individuals.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The Homeless Response Team is a pilot program comprised of an interdisciplinary team working with homeless patients accessing care at Strong Memorial Hospital in Rochester, NY. Self-identified homeless individuals admitted to the hospital were screened by social work to determine eligibility. Inclusion criteria included: the patient's status as homeless, no history of violence, not acutely psychotic. If appropriate, a response team was dispatched to enroll the patient. Student teams evaluated the patient's willingness to participate, reason for hospitalization, discharge plan, and response plan. Post discharge, teams scheduled weekly follow-up to assess current needs and barriers to compliance with the treatment plan, providing support as able. The intervention period is six months but is ended if patients are lost to follow-up or wish to withdrawal.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Measures of success include impact on patient care and barriers to care, student learning, and health care costs. These measures will be assessed by administering the Health Care Climate Questionnaire, Patient Activation Measures and Patient Activation Assessment at the start and end of the intervention and by qualitative analysis of student notes. Impact on care will be monitored by assessing the number of patients who are newly connected with a PCP, outpatient social work or housing. We will administer the Health Professionals' Attitudes Towards the Homeless Inventory to medical students pre and post-intervention to assess for changes in bias. We will analyze the readmission rates and hospital-associated health costs of the patients prior to, during, and after the intervention period.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Since April 2016, the Homeless Response Team has been referred fourteen patients, assessed twelve, and enrolled ten patients. One completed the intervention, five were lost to follow-up, two entered inpatient substance abuse treatment, two voluntarily ended their participation. The patients were racially diverse; the majority were chronically homeless middle-aged men with substance abuse problems living in emergency shelters, had insurance and a PCP, and identified transportation and cost as barriers. Students noted motivation as a barrier. Assistance given included establishing care with PCPs and social work, arranging transportation, accompanying patients to appointments, obtaining eyeglasses, insurance, and substance abuse treatment. Students worked with patients on reconciling concerns regarding treatment plans and the health care system.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Active post-hospitalization follow-up by medical students shows promise in connecting homeless patients with appropriate services and bridging the gap between inpatient and outpatient care.

THE MAGIC CLINIC: AN INTERDISCIPLINARY GERIATRIC CONSULT CLINIC EMBEDDED IN A PATIENT-CENTERED MEDICAL HOME Mark J. Simone[2, 1]; Lisa Padgett[2, 3]. [1]Harvard Medical School, Boston, MA; [2]Mount Auburn Hospital, Cambridge, MA; [3]Massachusetts College of Pharmacy and Health Sciences, Boston, MA. (Control ID #2693535)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Chronically ill older adults in the primary care setting often require an interdisciplinary team to address their health care needs; we therefore studied the impact of the creation of a geriatric consult service in a patient-centered medical home.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Optimize the medication regimens for older adults 2. Reduce health care utilization (ED visits, hospitalizations, readmissions) 3. Improve health outcomes and perform appropriate geriatric assessments for chronically ill older patients

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The MAGIC (Mount Auburn Geriatric Interdisciplinary Consultation) Clinic was created to provide an interdisciplinary geriatric consultative service to older adults in the Primary Care Center (PCC) at Mount Auburn Hospital (MAH). The MAGIC Clinic is staffed by a geriatrician, clinical pharmacist, and geriatric social worker. The MAGIC Team also includes interdisciplinary members from the PCC and MAH community who meet monthly to review recent cases and coordinate ongoing care. Geriatric patients are referred by their PCPs often

for reasons of dementia evaluation and management, medication optimization, functional decline, and complicated psychosocial issues.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We will measure health care utilization and other patient outcomes 6 months before and after enrollment in the MAGIC Clinic. We will also survey patients and providers.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The MAGIC Clinic opened March 2015, and during its first year, saw 27 patients during 61 encounters. The mean age is 79.3, range 65–92 years old. The majority of patients live alone (59%), 1/3 are dependent in ADLs, 2/3 are dependent in IADLs, with a mean of 12.6 chronic active conditions (range 7–23). One third have a high-school education or less, and about 15% are non-English speaking and racial minorities. Our pilot data for patients with at least 6 months of follow-up in the MAGIC Clinic ($n = 15$) show reductions in ED visits (70%, $n = 7$), hospitalizations (66%, $n = 6$), and readmissions (100%, $n = 3$). 10 patients were newly diagnosed with dementia. Vaccination rates increased significantly ($n = 27$) from 33 to 96% ($p < .0001$), and documentation of health care proxy increased from 41 to 62% ($p = .0143$). Our efforts to optimize medications show a decrease in anticholinergic risk score, total number of medications, daily dose burden, and reductions in potentially inappropriate medications. Our patient and provider surveys show high levels of satisfaction. Pre and post patient/caregiver surveys show improvements in all domains, with most feeling that the visits have improved their overall care and that they would recommend the service to others.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): We created an innovative and much needed geriatric consultative service embedded in a patient-centered medical home. This new clinical service is highly valued by patients and providers. Our team focuses on areas of great importance to the care of older adults. Patients and providers from practices outside of the PCC have asked for referrals to the MAGIC Clinic, so in the future we hope to expand our services beyond the PCC.

THE SHINGLES VACCINATION INITIATIVE- INCREASING RATE OF IMMUNIZATION AGAINST HERPES ZOSTER IN AN ELIGIBLE OUTPATIENT POPULATION. Irina Kushnir[2]; Ibrahim Ali[2]; Frank Cacace[1, 2]. [1]Hofstra North Shore LIJ, Great Neck, NY; [2]Northwell Health, Manhasset, NY. (Control ID #2707026)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): How to improve the quality of preventive care at the Long Island Jewish Ambulatory Care Unit (LIJ ACU) by increasing the rate of Shingles vaccination.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The primary objective of our initiative was to increase the number of patients at LIJ ACU who received a vaccine against Herpes Zoster. Our secondary objectives were to increase provider and patient awareness of the shingles vaccine, and to identify the barriers to administration of the vaccine which was being underutilized at our clinic.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Our initiative was implemented at a resident run clinic with a predominantly socioeconomically underprivileged and elderly patient population. We first identified and educated all health care personnel and patients about the benefits, harms, and indications for the Zoster vaccine. All patients over the age of 60 who do not have specific contraindications are eligible for the vaccine; we identified our population of interest with the help of a database provided by IT. We also identified barriers to administration of the vaccine, in particular lack of financial coverage by certain insurance companies, and collaborated with pharmacists to address these barriers.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We used quantitative metrics to measure the success of our initiative by comparing the number of individuals vaccinated with Zoster in the ACU clinic prior to initiation of our quality improvement project, and then at its completion. We also measured the amount of individuals vaccinated for Zoster each year, and analyzed the trend over the years, with particular attention to the trend from 2014 to 2016, from before the initiation to after the conclusion of our project.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We found that after implementation of our intervention, the rate of shingles immunizations rose drastically at our clinic. We began to implement our intervention after the advent of the 2015 academic year, and watched the rate of vaccinations practically quadruple from 14 vaccinated individuals in 2014 to 42 patients in 2015. We had completed our quality improvement project by the end of the academic year in 2016, and by July 2016, there were already 28 vaccinated patients in 2016. When simply comparing vaccination rates prior to and after implementation of our project, our findings were even more remarkable. A total of only 35 eligible patients received the Zoster vaccine between 2012 and 2015, compared to 91 patients that were vaccinated between July 2015 and 2016, the rate of vaccinations had nearly tripled in 1/3 the studied time after implementation of the zoster vaccination initiative.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our takeaway point from our quality improvement project is that a multidisciplinary approach should be employed, and that the benefits, harms, degree of efficacy and monetary cost of an intervention must always be addressed prior to its implementation.

THE SUBSTANCE USE WARMLINE: A NEW RESOURCE FOR PRIMARY CARE Rebecca Sedillo[2]; carolyn chu[2]; James Gasper[2]; Erin Lutes[2]; Benjamin R. Smith[2]; Jacqueline P. Tulsky[2]; Scott Steiger1. [1]University of California, San Francisco, San Francisco, CA; [2]University of California-San Francisco, San Francisco, CA. (Control ID #2702571)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Many primary care clinicians lack confidence and/or experience in substance use management, leading to significant stress, frustration, and burnout.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): In 2015, the Clinician Consultation Center (CCC) and Bureau of Primary Health Care launched a Substance Use Warmline (SUW), 855-300-3595, to increase access to timely, evidence-informed addiction medicine consultation for community health providers. The SUW aims to increase provider knowledge and skill through the delivery of tailored, expert clinical decision-support.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): A multidisciplinary team of expert nurses, Addiction Medicine-certified physicians, and clinical pharmacists provides free, on-demand telephone consultation for clinicians. The SUW offers advice on all aspects of substance use evaluation and management, including complex patients with co-occurring chronic pain, behavioral health issues, HIV, and other chronic conditions. The team logs case details in the CCC's secure standardized database.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Callers are emailed a 5-item Likert survey after each consultation to assess satisfaction with the service. Respondents also have an option to submit free-text comments. The SUW also monitors monthly call volume and repeat callers.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 63.7% of calls over the first year were from MDs/DOs, and the number of calls increased by an average of 28% per month. >25% were internists and 30% of physician callers had DATA2000 waivers to prescribe buprenorphine. Prescription opioids were discussed in 64.2% of cases, followed by stimulants (31.1%), alcohol (28.3%), non-prescription opioids (17.9%), sedative/hypnotics (13.2%), and other substances (13.2%). 43.4% of cases involved polysubstance use. Consultants discussed a broad range of clinical topics: SUD screening and diagnosis, MAT options, opioid safety/dosing/tapering, urine toxicology use, behavioral interventions for SUD, and withdrawal management. Almost 60% of cases involved documented psychiatric co-morbidities, and over a third involved patients with chronic pain. Callers consistently rated the SUW highly: the vast majority indicated questions were answered thoroughly with useful, up to date information. All survey respondents said they would both utilize the SUW again and recommend it to colleagues. One caller noted: "This was a great resource. I was at my wits' end trying different techniques and getting nowhere. I felt supported and I received new information to use." Almost a third of all callers contacted the SUW more than once.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The SUW appears to be a useful tool for primary care practitioners who have called to request on-demand, telephone-based substance use consultation.Early results suggest this service may help reduce or prevent burnout among providers managing complex patients who use drugs and/or are prescribed high-doses of opioids.

TIME CONSTRAINTS TRUMP ENTHUSIASM IN MEDICATION RECONCILIATION Carmen L. Lewis; Laurence Williams; Mary W. McCord; Hillary Chrastil; Lauren Drake; Huong M. Lam. University of Colorado, Denver, CO. (Control ID #2698925)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): General Internal Medicine practices increasingly face unrealistic work expectations and are challenged to re-distribute work from physicians to other team members.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1.) Determine the practicality of full medication reconciliation by medical assistants (MAs) during the rooming process. 2.) Assess the fidelity and time required for full medication reconciliation.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Initially, our practices agreed across our three clinical teams to train MAs to reconcile up to six medications, deferring patients with more than six medications to physicians. Subsequently, a system wide initiative for medication reconciliation training was required. After this training, MAs on two of three teams organically expanded to full medication reconciliation. To standardize our work, the nurse coordinator required the third team expand to full medication reconciliation. MAs on the third team voiced concerns about their ability to complete full medication reconciliation, in addition to other rooming requirements within the currently allotted 5 to 7 min traditional rooming time.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Several weeks after the clinic-wide implementation, the third team's providers indicated that not only was medication reconciliation not being done reliably, but other rooming requirements were also suffering. This outcome seemed to be isolated only to the third team, as the other two teams reported strong compliance with the new medication reconciliation procedure and high quality rooming. We performed a Root Cause Analysis (RCA) exercise to: 1) Define the timeline that led to the current state. 2) Identify the contributing factors and root causes. MA observations were conducted to determine fidelity and time required for full medication reconciliation.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The RCA exercise concluded with two possible root causes: 1) Workload distribution within the clinic was not consistent, causing challenges for the third MA team. 2) The concern about time constraints were not adequately addressed on the two teams who adopted full medication reconciliation. We found that individual MA rooming workload was unequally distributed across teams (15.3, 13.7, and 11.5 patients roomed/MA) indicating that volume was not the cause of the third team's performance, as it was the team with the lowest volume. We also conducted a series of 13 observations, which showed an additional five to eight min were required to complete full medication reconciliation. We found only members of the third team correctly completed full medication reconciliation.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1.) System training can impact local environments and disrupt existing workflows. 2.) Enthusiasm for expanded work among MAs, encouraged spread without adequate evaluation of time and fidelity. 3.) RCA analysis can be a helpful tool to examine performance.

TO CHOOSE WISELY: REDUCING THE OVERUSE OF LABS IN HOSPITALIZED PATIENTS - A HIGH VALUE CARE ENDEAVOR
Ana I. Velazquez[2]; Mariana Mercader[2]; Krystle Hernandez[2]; Rifat Mamun[2]; Daniel I. Steinberg[1]; Alfred Burger[3]. [1]Beth Israel Medical Center, New York, NY; [2]Mount Sinai Beth Israel, New York, NY; [3]Mount Sinai Beth Israel, Icahn School of Medicine at Mount Sinai, New York, NY. (Control ID #2706220)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Routine daily labs are often performed without clear clinical indication on stable hospitalized patients.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. To reduce the ordering of unnecessary daily labs 2. To educate providers on appropriate ordering of labs on the hospitalized patient

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The Society of Hospital Medicine Choosing Wisely recommendations state providers should avoid performing repetitive CBC and chemistry testing in the face of clinical and lab stability. Our institution removed the “daily labs” order capability from our EMR in June 2014. An audit of lab use 1-year later showed no change in lab volume. Discussion with providers revealed labs were being ordered several days in a row, by creating individual orders timed to occur each day. A survey of our housestaff showed a majority were in favor of change reducing “daily labs” use. The HVC committee devised a multipronged approach to reduce lab overuse via provider education, peer champion advocacy, and team based feedback on lab ordering patterns. We reviewed CBC and chemistry labs performed from March- July 2016 on3 of our general medicine teaching floors to establish our baseline ordering practices. The percentage of basic labs ordered >24 h in advance of being done was found to be 20%. An educational presentation based on the *Choosing Wisely* campaign and our baseline lab ordering pattern was given to IM residents and hospitalists. This intervention was performed at the start of each 4-week block beginning in August. IM service lab ordering data was reported bi-weekly to team members, reviewing the percentage of labs ordered >24 hours in advance for their block period.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): At the end of each 4 week block the percentage of labs ordered >24 hours in advance was measured. This percentage was compared to our baseline percentage. An absolute and relative change was calculated for each block rotation.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): In the first 4 week block of our intervention we saw no change. In the second block with an increased focus on peer championing and feedback to each team member we saw a slight decrease in unnecessary lab ordering to a total rate 18.4%. In the 3rd and 4th 4 week blocks of the intervention we respectively saw decreases to 12.5 and 13.8% in labs ordered >24 hours advance of being drawn. This was a relative decrease by 37.5 and 31% of labs ordered in the absence of current clinical data.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our project shows that while the best solutions generally are system based, the culture around overuse and the ability of physicians to create solutions to problems may require a more manual process of monitoring clinical behaviors and providing feedback. We have seen significant changes in physician behavior during our intervention. While culture change may take a longer period and regression to the mean errors can be made based on early and limited data, we look to sustain this success and change the culture at our institution around daily lab use.

TO THE HOSPITAL AND BACK: AN INTERPROFESSIONAL TRANSITION OF CARE CLINIC TO REDUCE HOSPITAL READMISSION Ryan Nall. University of Florida, Gainseville, FL. (Control ID #2706341)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can a primary care based interprofessional transition of care clinic reduce 30 day hospital readmission, ED utilization 30 days post-discharge, and improve timely primary care follow-up?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Reduce hospital readmission at 30 days 2. Reduce ED utilization 30 days post hospital discharge 3. Improve timely follow-up in the primary care clinic post discharge (defined as less than or equal to 14 days)

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We developed an outpatient interprofessional transition of care clinic in a university based academic internal medicine clinic. The clinic is staffed by an attending physician, medical resident, medical student, social worker, psychologist, pharmacist, pharmacy resident, pharmacy student, registered nurse and home health representative and operates one half-day a week. Our clinic is notified of hospital discharge for those patients seen at our affiliated hospital. Within 48 hours after discharge all patients followed by our clinic are contacted by phone by a registered nurse or pharmacist. This call focuses on ensuring appropriate follow up in clinic, medication reconciliation, and addressing any issues since discharge. The primary goal for follow up is with the patient’s primary care provider, when that isn’t possible in an appropriate time frame the patient is scheduled in the transition clinic. The first 30 min of the transition clinic schedule is protected for an interdisciplinary team huddle which focuses on follow up from the prior week and review of the patients that will be seen in clinic each day. The resident or attending will present the medical history followed by group discussion of medical, psychosocial and logistical issues which could contribute to readmission. During the huddle we determine which team members will see the patient and when. The note from the visit is forwarded to the primary care provider for review.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Through chart review we will measure the transition clinics impact on 30-day readmission rate, ED utilization 30 days post discharge, and the number days until follow-up in primary care when compared to standard follow-up in our clinic.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Data from the project is currently under review. Preliminary data to date shows a statistically significant reduction in 30-day readmission rate in those patient’s seen in the transition clinic when compared to those with standard follow-up. Complete results will be available at the time of the conference.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our project demonstrates that an interprofessional outpatient transition clinic can reduce 30 day hospital readmission. Our transition clinic leverages many already existing resources and focuses them in a collaborative fashion on patients during this high risk transition in care. Through interprofessional teamwork many of the psychosocial and logisitical issues that lead to readmission can be addressed.

TRANSFORMING A LARGE URBAN HEALTH SYSTEM TO PROVIDE COMPREHENSIVE TRANSGENDER CARE Jules Chyten-Brennan[1]; Zoe Ginsburg[2]; Mollie B. Nisen[2]; Madeleine Lipshie-Williams[2]; Elliot Goodenough[3]; Patel V. Viraj[1]; Robert Beil[1]. [1]Montefiore Medical

Center/Albert Einstein College of Medicine, New York, NY; [2]Albert Einstein College of Medicine, Bronx, NY; [3]Montefiore Medical Center, Bronx, NY. (Control ID #2703567)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Transgender (trans) people are highly marginalized, have pervasively poor health outcomes, and limited access to healthcare.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): We describe efforts to integrate trans healthcare throughout a large integrated health system with primary through quaternary care, with the goals of: 1. Increasing access to comprehensive healthcare for trans people in an urban, underserved area. 2. Increasing competence in caring for trans patients at every level of care.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): In 2014, five Montefiore providers formed the Trans Health Working Group with initial goals of attracting key department champions, and improving care for trans people within existing services. Senior administration expressed support, and provided the services of a learning specialist. The new goal of a comprehensive transgender health program emerged. Program focus areas include: best practices for medical, surgical and mental health care; institutional policies; information systems; development and implementation of educational curricula; and mechanisms for community accountability.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Process and outcome based metrics are being used in the following areas: −Representation in the Trans Health Working Group -Number of departments and employees trained -Utilization of internal referrals systems -Trans inclusion in institutional policies -Qualitative feedback from trans community members -Number of available trans-specific medical, surgical, and mental health services

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The Trans Health Working Group now has over 50 members from 14 departments, including residents and medical students. We have created an intensive trans competency curriculum for higher volume sites, and an online course is being implemented for all new employees. We have completed focus groups among current and potential trans patients as a step toward an ongoing community advisory board. Institutional non-discrimination, and bed assignment policies have been modified. Primary and hormonal care are available at one third of clinical sites. Numerous transgender surgeries are available, with more planned. Trans appropriate electronic health records will be piloted in 2017.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Heathcare for trans people has been historically limited to LGBT specific clinics or individual providers with few health systems taking steps to care for transgender communities. However, with newly expanded access to health insurance, decreasing exclusions for trans care, and growing social support, the movement of trans communities into mainstream health settings will likely continue. Examining the successes and challenges of integrating trans healthcare into our large, urban health system offers a model for other institutions.

TRIANGLE INTERPROFESSIONAL PARTNERS FOR PREVENTION (TIPP): STUDENTS COLLABORATING TO IMPROVE CARE FOR SUPERUTILIZER PATIENTS

Trudy Li[3]; Rob Broadhurst[3]; Meg Zomorodi[3]; Jamie A. Jarmul[2]; Anne Jones[3]; Sara Skavroneck[3]; Meredith Park[4]; Amy Weil[1]. [1]UNC Chapel Hill School of Medicine, Chapel Hill NC, NC; [2]UNC-Chapel Hill, Durham, NC; [3]University of North Carolina at Chapel Hill, Chapel Hill, NC; [4]University of North Carolina at Chapel Hill, Greensboro, NC. (Control ID #2704227)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Superutilizers (SUs) of the healthcare system experience frequent hospitalizations and emergency department (ED) use as well as fragmented care, leading to high costs and low quality care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Develop sustainable processes to engage IP students in improving quality of care for SUs by identifying and addressing root causes of hospitalizations. 2. Decrease hospitalizations and ED visits for SUs, lowering total hospital charges. 3. Increase IP students' mutual understanding and respect for each other's skill set.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Using an algorithm to identify SUs at our institution (>3 hospitalizations in 12 months), IP teams of students (social work, nursing, public health, and medicine) conducted home visits to identify root causes of hospitalizations and improve care coordination. Student teams of 2 or 3 worked closely with SUs to address risk factors for readmission. Each week, students met with IP faculty to discuss SU needs and progress.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1. Pre/post-intervention hospitalization and rates and monthly charges were compared. 2. Pre/post surveys of readiness to work in IP teams were performed.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Recruitment is ongoing, but preliminary results are available. Of the seven enrolled patients, pre-intervention average monthly inpatient charges ranged from $2,235 to $19,662 monthly. Pre-intervention average monthly outpatient charges ranged from $0 to $6,457. Post-intervention, average monthly inpatient cost decreased in five of seven patients. For these patients, average monthly inpatient charges ranged from $0 to $50,267 and outpatient charges ranged from $85 to $5,290. Three of seven patients have not had any additional hospitalizations post-intervention.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Identifying and connecting with patients 1. Custom-built Electronic Medical Record reports identified patients with high hospitalization and/or ED use. 2. Initially only currently admitted patients were enrolled. However, inclusion criteria were broadened to include patients identified from the outpatient setting. 3. Exclusion criteria were key for facilitating student participation (e.g. exclusion of patients with unsafe home conditions/ongoing psychological issues after communication with PCPs as well as patients who lived too far away from campus) IP Education: Logistical difficulties 1. Scheduling meetings and patient visits was difficult due to differences in curricular schedules among schools. 2. Differences in students' EMR access denoted an implicit hierarchy as in many cases only medical students had access. Students as significant contributors to

care To improve quality and efficiency of care for SUs, many of whose needs are contextual rather than purely medical, students are an untapped resource for academic medical centers. Working with SUs also increases students' commitment to care for vulnerable populations.

URINE TOXICOLOGY SCREENING IN PATIENTS WITH CHRONIC OPIATE USE: AN ATTEMPT TO CURB OPIATE ABUSE IN A PRIMARY CARE PRACTICE Kaitlin E. Crowley[1]; Amy L. Bilodeau[1]; Alev Atalay[2]; Rose M. Kakoza[1]. [1]Brigham and Women's Hospital, Boston, MA; [2]Brigham and Women's Hospital, Jamaica Plain, MA. (Control ID #2706768)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): With the rapid increase in rates of opioid addiction and opioid-related deaths, it is important for primary care clinics to monitor opioid use utilizing urine toxicology screens and appropriately act on those results to improve the safety of opioid prescribing.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To analyze urine toxicology results at our large academic primary care practice for discrepancies and assess rates of primary care provider follow up.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Retrospective chart review at a large outpatient primary care practice within a tertiary academic medical center. Using a new chronic opioid registry, the practice implemented workflows to facilitate routine urine toxicology screening. Patients analyzed were those screened between 7/1/2016 to 10/30/2016.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Urine toxicology screen results were assessed for discrepancies based on the opioid medications patients were prescribed. Following assessment of these results, further chart review was conducted to determine actions taken by primary care providers based on those results, specifically: documentation of discrepancies and adjustments to medication regimens.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A total of 62 urine toxicology screens were reviewed for this analysis. Of the 62 screens, 37 (59.7%) were found to be appropriate, 15 (24.1%) were inappropriate, and 10 (16.1%) had results with unclear interpretation. Of the 15 cases determined to be inappropriate, 6 (40.0%) were suspect for patient tampering, 7 (46.7%) were positive for drugs not prescribed to the patient, and 2 (13.3%) yielded negative results when they should have been positive. Documented acknowledgement ("review") of the urine toxicology screen by the ordering provider in the electronic medical record was noted for 49 (79%) of the screens. However, further documentation or discussion of the results with a note in the medical record chart was found for only 14 (23%) of the screens. Of the 25 potentially discrepant results, 20 (80.0%) were not addressed in the electronic health record and only 1 (4%) had a change to their medication regimen in response to the discrepancy found on urine toxicology screening.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): With the current opioid epidemic primary care practices need to implement effective monitoring systems to proactively screen patients on chronic opioids to ensure safe prescribing. In our experience, despite implementation of an effective screening process, a minority of patients identified with discrepant urine toxicology results had any documented follow up or change to their opioid medication regimen. Potential factors for poor follow up include lack of provider education on interpretation of urine toxicology screens and provider time and skill in addressing discrepant results with patients. Provider education and training in these areas will be an important next step for the practice as we seek to improve our ability to not only screen our patients on chronic opioids but to also adequately treat those for whom a potential problem is identified.

USE OF A MACHINE-LEARNING ELECTRONIC EARLY WARNING SCORE SYSTEM REDUCES TIME TO THERAPY IN ACUTE DETERIORATION. Santiago Romero Brufau; Kim Gaines; Jordan Kautz; Matthew G. Johnson; Joel A. Hickman; Curt Storlie; Jill Nagel; Jeanne M. Huddleston. Mayo Clinic, Rochester, MN. (Control ID #2707223)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Delayed detection and intervention to acute deterioration of inpatients is prevalent and increases mortality risk.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): − Reduce time to response after acute deterioration of inpatients (sepsis, shock, acute respiratory insufficiency, etc.). - Reduce time to therapy (antibiotics, other medication, oxygen, fluids, etc.) in instances of acute deterioration of inpatients.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): Setting: two tertiary hospitals in southeastern Minnesota. Intervention: a system that automatically pulls data from the electronic medical record, calculates risk score for acute deterioration, and send an automatic alert to the physician, resident or NPPA on call. After receiving an automatic alert, the recipient is expected to go to the bedside to assess the potentially deteriorating patient. The system rechecks two and three hours after that point, sending additional automatic alerts if the patient's risk score is still unusually high. At the three-hour mark, the attending physician is also automatically alerted. The risk score was developed using machine learning methods, and a nursing assessment using their pattern recognition. After the initial alert, the system guides a time-limited escalation of expertise to the bedside.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): − Main measures of success are: Reduction in the time to any order (laboratory tests, image tests, medication, etc.), measuring time to physician action or assessment. Reduction in the time to a therapy order (medication, oxygen, fluids).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): − The intervention reduced the time to any order from 63 min to 41 min (a 40% reduction), and the time to a therapy order from 106 min to 56 min (a 47% reduction). - As counterbalance measures, rates of ICU transfer and mortality were not significantly changed.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR

COMMUNITY?): − Automatic alerts using accurate early warning scores can help with detection of instances of acute deterioration of inpatients. - A time-limited escalation of expertise can help with timely intervention and prioritization of acute events in the hospital, and can reduce time to intervention.

USING AN OUTPATIENT POST-MORTEM SURVEY TO IDENTIFY QUALITY IMPROVEMENT STRATEGIES Jessica Kaltman; Anne M. Walling; Neil Wenger. UCLA, Los Angeles, CA. (Control ID #2706554)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Significant deficiencies exist in quality of end-of-life care received by cancer patients in symptom management, communication, emotional and spiritual support, advance care planning and coordination of care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): A post-mortem survey is an emerging strategy to inform end of life quality improvement efforts. We describe the process of developing and implementing a post-mortem survey in the outpatient setting at an academic health system, and the barriers and facilitators of implementation in this setting.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): We developed a 24-item post-mortem survey consisting of 14 items from the National Quality Forum-endorsed Bereaved Family Survey, seven validated items from the After Death Bereaved Family Interview, Family Evaluation of Hospice Care, and the National Health and Aging Trends Study, and three created items to reflect the ambulatory care setting. Eligible decedents were > 18 years of age and spoke English, had > 2 visits to the oncologist in the last 6 months of life, received chemotherapy or radiation therapy in the last 2 years of life, and had chart documentation of metastatic disease. Death was verified in the chart or by obituary found via internet search. Caregivers surveyed were the appointed healthcare surrogate in an advance directive or the first listed contact. The list of eligible decedents was reviewed by the Offices of Risk Management and Patient Relations to identify individuals who may experience harm by receiving a survey. An introduction letter and survey were sent 12 weeks after the decedent's death to the identified caregiver. Respondents could opt out by telephone or mail. A post-card reminder was sent two weeks after initial mailing if no response received and telephone follow up after four weeks.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We tracked response rate, percentage of post-card reminders sent and follow-up phone calls required to evaluate mechanisms to improve response rate. Challenges faced during implementation were tracked. We evaluated time required for administrative departments to review decedent list and time required to prepare survey mailings.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Of 111 eligible decedents, 94 surveys were mailed to caregivers and 30 surveys (32%) were completed. Of the total eligible decedents, 21% had an advance directive. Death could not be verified for 12% of decedents, addresses for 15% of caregivers could not be found and only 5% of caregivers called to find their address returned the call. 4% of caregivers opted out. Of the surveys returned, over 80% of respondents answered all items on the survey and 83% responded to the open-ended item. Responses to the open-ended question addressed caregiver training, quality of hospice care, and communication amongst physicians and between the physician and patient. Follow-up phone calls to non-responders did not improve response rate.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A post-mortem survey can be implemented in the outpatient setting to assess quality of end of life care, but additional efforts are needed to enhance response rate.

VIDEO VISITS IN PRIMARY CARE: A NATIONWIDE PILOT STUDY AT THE VETERANS HEALTH ADMINISTRATION Leonie Heyworth[2]; Kathryn Corrigan[3]; Gordon Schectman[1]. [1]Veterans Affairs Central Office, Milwaukee, WI; [2]VA San Diego, San Diego, CA; [3]VA Central Office, Washington, WA. (Control ID #2710674)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Does the addition of video visits among Veterans receiving traditional primary care improve clinical outcomes, satisfaction and reduce cost of care?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To examine the impact of video visits, in addition to traditional primary care, on outpatient quality measures, healthcare utilization, cost and satisfaction among Veterans at 4 sites.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS): The Veterans Health Administration's (VHA) Patient-Aligned Care Team (PACT), is a team-based approach to delivering patient-centered primary care with the aim of enhanced access and coordinated care management. Core PACT team members include the primary care provider, the registered nurse care manager, the clinical assistant and the clerical assistant. To date, PACT has successfully increased reliance on non-traditional means of accessing care, such as use of secure messaging and teleprimary care into a rural clinic setting. The "Video PACT" offers video encounters through clinical video technology (CVT) and web-based real time communication via mobile platform. Four sites were invite to participate. Each site identified two physicians as Video PACT providers. Veterans are selected for participation in the pilot by their PACT based on several criteria, including willingness to participate, ability to use a computer or tablet, and likelihood to benefit from the pilot (e.g. difficulty accessing care, frequent ER/hospital use, multiple comorbidities). Veterans are trained to use the tablet or computer software for the video visit and issued a tablet if needed.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The first phase of this pilot assessed Veteran and provider experience of video visits by survey as well as clinical quality metrics, such as blood pressure; utilization of health services; and process measures like diabetes screening and receipt of vaccinations, obtained via chart review. The direct cost of video encounters was compared to face-to-face encounters.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): In the first phase of this pilot, 15 video encounters took place across 2 medical centers. Survey response rate was 71%. The mean age of participants was 65. The majority were white males. 71% had a

diagnosis of PTSD or depression; 71% had hypertension; 57% had heart disease; 36% took opiates for chronic pain. A majority of patients were up to date with recommended vaccinations and screening for key chronic conditions. Overall, patients were very satisfied with their experience with video visits, with 90% opting for a repeat video visit, 90% willing to recommend video visits and 78% believing that it improved their access to care. The average cost for a video visit was $390, compared to $457 for a face-to-face visit.

KEY LESSONS FOR DISSEMINATION (**WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY**?): Implementing video encounters presents a novel opportunity to enhance patient-centered care for organizations interested in leveraging technology to expand access in primary care. The findings to date from this pilot study suggest high levels of patient satisfaction for video visits and a lower cost of video visits compared to face-to-face visits.
