

CD contents

The attached CD contains the file `eflib.for` which is a program library for use in various applications of the ef-based methods. The file collects both the directly accessible subroutines described in the book and the ones which are called internally by these. All subroutines were written in FORTRAN-95 and commented.

The subroutines described in the book (in alphabetic order), their purpose and the page number where they are presented are as it follows:

CENC1	- quadrature of a product of functions by ef-based extended rule.	118
CGEBASE	- computation of the functions $\eta_s(Z)$, $-1 \leq s \leq 6$, for given double complex Z .	64
CGEBASEV	- computation of the functions $\eta_s(Z)$, $-1 \leq s \leq n_{max}$, for given double complex Z and integer n_{max} .	64
EFDER	- ef-based numerical differentiation.	90
EFEXTQS	- coefficients of the ef-based extended quadrature rule with symmetric abscissas.	114
EFGAUSS	- weights and abscissas for the ef-based Gauss-Legendre quadrature rule with $1 \leq N \leq 6$ points.	130
EFQQUAD	- quadrature with the ef-based Gauss-Legendre rule with $1 \leq N \leq 6$ points.	130
EFINT	- ef-based two-point interpolation of a function.	139
EFNUM	- coefficients of various ef-based versions of the method of Numerov.	198
EFQNS	- weights of the ef-based quadrature rule with non-symmetric abscissas.	102
EFQS	- weights of the ef-based quadrature rule with symmetric abscissas.	102
EF4STEP	- coefficients of various ef-based versions of the	212

	symmetric four-step method for $y'' = f(x, y)$.	
GEBASE	- the same as CGEBASE for given double precision Z .	63
GEBASEV	- the same as CGEBASEV for given double precision Z .	63
REGSOLV	- numerical solution of the linear system $\mathbf{Ax} = \mathbf{b}$ with one block of functions for the coefficients.	23
REGSOLV2	- numerical solution of $\mathbf{Ax} = \mathbf{b}$ with two blocks of functions for the coefficients.	71

The following subroutines (also in alphabetic order) are called internally by the previous ones: CINFF1, CINFF2, CINFG1, CREGLIS, DCLUDEC, DCLUSBS, DCREGBL, GSYST, INFFENC1, INFFENC2, INFFFOUR, INFFNC1, INFFNC2, INFGENC1, INFGFOUR, INFGNC1, INFGNC2, LUDEC, LUSBS, REGBLOCK, REGLIS.

Topic Index

- Critical values, 82–83, 89, 111–112, 125, 137–138
- Divided differences, 18
- Error
 - classical version, 50
 - exponential fitting version, 49
 - leading term *lte*, 50
- Extended quadrature rules with predetermined abscissas, 105
 - integration of a product of functions, 118
 - subroutine for, 118
 - symmetric abscissas, 106
 - subroutine for, 114
- Filon's formulae, 2
- Flow chart, 66
- Four-step methods for second-order ODEs
 - subroutine for, 212
 - various versions, 211
- Functions $\eta_s(Z)$
 - definition, 58
 - properties, 59
 - subroutines for, 63–64
- Gauss–Legendre rule, 39, 121
 - subroutines for, 133
- Level of tuning P , 69
- Levin's approach, 3
- Methods for first order ODEs
 - A-stability, 162
 - A₀-stability, 162
 - A(α)-stability, 162
 - absolute stability, 161
 - region of stability, 162
 - zero-stability, 158
- Methods for second order ODEs, 192
 - P-stability, 201, 209
 - periodicity interval, 201
 - primary/secondary, 209
 - phase fitting, 204
 - phase lag, 204
 - region of stability, 205
- Newton–Cotes rule, 38, 95
 - extended, 106
 - subroutine for, 114
 - subroutine for, 102
- Newton–Raphson iteration, 130, 172
- Numerical differentiation
 - first derivative
 - ad-hoc version, 80
 - five-point formula, 83
 - three-point formula, 1, 28, 77
 - second derivative, 87
 - subroutine for, 90
- Numerov method, 192
 - subroutine for, 198
 - version S₁, 193–194
 - version S₂, 194
 - version S₃, 195
- Operator \mathcal{L}
 - classical moments, 42
 - starred moment, 42
 - exponential fitting moments, 40
 - μ moment, 40
 - starred moment, 42
- Operator \mathcal{L}
 - definition of, 38
- Quadrature rules with predetermined abscissas, 94
 - nonsymmetric abscissas, 101
 - subroutine for, 104
 - symmetric abscissas, 95
 - subroutine for, 102
- RDE, 12
 - characteristic polynomial of, 12
 - roots of, 12
 - linearly independent solutions of, 13
- Regularization procedure, 11, 16
 - subroutine for, 23, 71
- Runge-Kutta methods
 - explicit
 - three-stage, 226

- Butcher tableau, 224
- formulation, 223
- four-stage, 227
- one-stage, 226
- two-stage, 226
- Runge-Kutta methods
 - exponential-fitted
 - Butcher tableau, 234
 - embedded pair, 250
 - error analysis, 240
 - error control, 246
 - explicit, 231
 - four-stage, 238
 - frequency determination, 253
 - implicit, 261
 - partitioned method, 284
 - Simos' approach, 241
 - steplength control, 246, 253
 - three-stage, 237
 - two-stage, 236, 271
 - Runge-Kutta methods
 - general
 - algebraic order, 224
 - column-simplifying conditions, 229
 - quadrature order, 230
 - row-sum conditions, 224
 - row-simplifying conditions, 230
 - s-stage, 224
- Runge-Kutta methods
 - implicit
 - Albrecht's approach, 267
 - Butcher tableau, 262
 - classical, 262
 - collocation, 265
 - linear operators, 234
 - order conditions, 263
 - specific implementation, 288
 - Runge-Kutta Nyström, 298
- Schrödinger equation, 53, 57–58, 80, 146, 192, 195–196, 212, 215
- Selfconsistency condition, 69–70
- Simpson formula, 92
 - subroutine for, 102
- Trapezoidal rule, 1, 100
 - subroutine for, 102
- Two-point interpolation, 134
 - subroutine for, 139
- Two-step bdf algorithm
 - exponential fitting versions of, 147
 - evaluation of the frequencies, 172
 - flexible form AEF, 169
 - selection of the version, 172
 - stepsize control, 183
 - variable-step form of AEF, 178
- function fitting version of, 186
