

INDEX

A

- Adams's costs, 117, 119
- Ad valorem taxation, 11, 158
- Afforestation, 99–124
 - definitions, 101
 - deforestation compared, 101
 - domestic vs global solutions, 101–102
 - effectiveness, measuring, 114–115
 - harvest age, 116
 - motivation for, 99–101
 - nursery capacities, 108, 118, 120
 - TREES model, 102–123
- Aggregation, exact, 140
- Alliance of Small Island States (AOSIS), 72
- Altruism, intergenerational, 125–137
 - infinitely-lived agent, 127
 - overlapping generations approach, 127–128, 130–136
- Arbitrage and transmission capacity rights, 55, 57–58, 63–64
- Armijo line search, 147, 151
- ATL, 141
- Auction model for transmission congestion contracts, 33–45
- Autonomous Energy Efficiency Improvement (AEEI) rate, 88–89

B

- Backstop resource, natural gas as, 12–17
- Backstop technologies, 2
 - carbon dioxide emissions and, 129
 - CETA-R model, 88–89
- Benefits. *see also* Social welfare
 - from technological progress, underestimating, 17–20
- Berlin Mandate, 67–82
- Bias in forecasting, 184
- Bids. *see* Transmission congestion contracts auction model

C

- Capital stock

- in CETA-R model, 86
- emissions reductions and, 70, 74, 76
- energy demand models and, 3
- Carbon constraints
 - carbon budget, 76–78
 - decreasing stringency, 79–81
 - emissions baseline, 70–71
 - general equilibrium models and, 70
 - technological change and, 70
- Carbon dioxide emissions, 67–82. *see also*
 - Greenhouse gas emissions, reduction of
 - afforestation and, 99–124
 - CETA-R model, 85–98
 - CHALLENGE project, 182–183
 - decoupling with energy use, 71
 - future projections, 70–72
 - GDP growth and, 72
 - intergenerational altruism and, 128–137
 - technological advances and reduction, 69–70, 76, 85–98
- Carbon sequestration. *see* Afforestation
- Carbon shadow prices, 89, 92, 95
- Carbon tax, 103, 112, 118, 182
- CETA, 69–75
- CETA-R model, 86–98
 - Autonomous Energy Efficiency Improvement (AEEI) rate, 88–89
 - backstop technologies, 88–89
 - carbon shadow prices, 89, 92, 95
 - climate system, 87
 - economic system, 86–87
 - emissions, near term, 93
 - emissions paths, optimum, 89–94
 - information value, 94–95
 - loss probability functions, 87–88
- CFC emissions, 87
- CHALLENGE project, 182–183
- Choke price, 22
- Climate change
 - afforestation, 99–124
 - altruism, intergenerational, 125–137
 - emissions control, technological advances in, 85–98
 - loss probability functions, 87–88
 - mitigation strategies, cost-effective, 67–82
 - public good, climate as a, 126

time scale, 86
 CNLP, 141
 Coalbed methane, 11, 12
 Cobb-Douglas function, 128, 143–144, 166–167
 Cohort classification scheme, 106
 Community indifference curves, 140
 Competition, interfuel, 3–4
 Complementary slackness, 142
 Conference of the Parties, 68
 Congestion contracts, transmission, 33–45
 Congestion rent, 56–58
 CONOPT, 141
 Costs
 congestion, 34, 38–40
 opportunity, 37, 39, 41, 48, 108
 technological advances model and, 12–29
 Cross-price elasticity, 4
 Cumulative-reserve-additions cost curve, 27

D

Deforestation, 101. *see also* Afforestation
 Demand
 end-use modeling, 4–5
 flexible, 11–12
 inertia, 26, 27
 integrating supply with, 5
 interfuel competition, 3–4
 price and non-price determinants, 2–3
 technological advances model, 11–29
 Depletion, resource, 2
 Deregulation of natural gas, 20
 Discount rate
 in models of technological advances, 25, 26
 social, 127–128
 TREES model, 103, 113
 Duality theory of linear programming, 140

E

Economic dispatch, 36, 39, 43
 Economic rent and transmission capacity rights, 54–55
 Economy-energy interactions
 aggregate, 5–6
 models, 69–75
 multisector, 6
 Edgeworth-Bowley box diagram, 144
 Effective cost and transmission congestion contracts, 40
 Efficiency, interregional, 69, 73–75

Efficiency, intertemporal, 69, 73–74, 76
 Egoism, selfish, 132
 Elasticity
 of demand, 108
 price, 2–4, 6
 Electrical power network
 contract vs physical path, 48, 50
 costs, private vs social, 50
 Kirchoff's laws, 47–48, 50, 56
 loop flow, 47, 53, 59
 monopoly, 47
 point-to-point service, 59
 spot markets in, 47–65
 trading rule, 48, 50–64
 transmission capacity rights, 48, 50–64
 transmission congestion contracts auction model, 33–45
 zonal pricing, 59
 Electrical power network, spot market model, 47–65
 arbitrage, 55, 57–58, 63–64
 competitive equilibrium, 52–64
 congestion rent, 56–58
 example, dynamic trading process, 56–59
 market mechanism, 50–56
 model, simple, 48–50
 proofs of propositions, 60–64
 rent maximizing, 54, 57–59
 surplus, merchandising, 56–58
 transmission capacity rights, 48, 50–64
 Electric forward agreement, 42
 Electrolysis, 88
 Endowment vectors, 140, 143–145
 End-use modeling, 4–5
 Energy decoupling with GDP growth, 71
 Energy-economy models, 69–75
 Energy efficiency and demand, 3
 Energy Modeling Forum, 178
 EPPA, 69–75
 Equity, intergenerational, 125–127
 Erosion, 101
 Exact aggregation, 140
 Export prospects, measuring, 12
 Externalities in electrical power market, 47, 50, 53, 59

F

Fairness, intergenerational, 125–127
 Flexible demand, 11–12
 Framework Convention, 68, 81–82, 182
 Future projections, 70–72

G

- GAMS, 132, 159–174
 Gas. *see* Natural gas
 Geo-engineering, 100
 Geothermal energy, 91
 Global integrated assessment (GIA), 103, 109–110
 Greenhouse gas emissions, reduction of
 altruism, intergenerational, 125–137
 AOSIS proposal, 72–73, 80
 Berlin Mandate, 67–82
 capital stock, 70, 74, 76–78
 CHALLENGE project, 182–183
 efficiency, interregional, 69, 73–75
 efficiency, intertemporal, 69, 73–74, 76
 energy-economy models, 69–75
 future projections, 70–72
 hedging strategy, 68
 international cooperation, 69, 73–75, 78, 81
 ‘no regrets’ options, 72
 stringency, decreasing, 79–81
 technological progress and, 69–70, 76
 tradable carbon rights, 126, 128, 130–136
 trade effects, 74, 75, 80–81
 trading emission rights, 73, 75

H

- Hansen’s Activity Analysis example, 165–174
 Hedging strategy, 68
 research and development as, 97
 transmission congestion contracts, 34–35, 38
 Heuristics in forecasting, 184
 Homotheticity, 143–144
 Hydroelectric power, 91

I

- IIASA, 178
 Income redistribution, 27
 Inertia, demand, 26, 27
 Inertia, thermal, 86
 Infinitely-lived agent, 127
 Interfuel competition, 3–4
 International cooperation, 69, 73–75, 78, 81
 International Energy Agency, 178
 International Energy Workshop, 177–185
 CHALLENGE project, 182–183
 first meeting, 178

- methodological considerations, 184
 oil price projections, 178–182
 random walk model, 179–180
 Intertemporal efficiency, 69, 73–74, 76
 Intertemporal optimization, 126
 Intertemporal resource rent, 2
 IPCC (Intergovernmental Panel on Climatic Change), 68, 71, 87, 182–183

J

- Jacobian matrix, 152
 Job creation potential, 15
 Joint maximization. *See* Sequential joint maximization

K

- Karush-Kuhn-Tucker conditions, 142
 Kirchoff’s laws, 36, 41, 47–48, 50, 56

L

- Lagrange multipliers, 142, 147
 Lemke’s algorithm, 150
 Loop flow, electric power, 47, 53, 59
 Lyapunov stable process, 48, 55–56, 63

M

- Marginal cost curve, long run, 2
 Market-clearing price, 5, 38, 41
 MERGE
 afforestation model, 100, 102–104, 109–110, 112–113, 121–123
 carbon dioxide emissions reduction, 69–75
 Methane
 coalbed, 11, 12
 emissions, 87
 MiniCAM, 69–75
 MINOS, 141
 MRT, 141

N

- Natural gas
 backstop resources, 12–17
 deregulation, 20
 greenhouse gas emissions and, 91–92

nonconventional sources, 10–11
 technological advances and use model,
 9–29
 Negishi procedure, 132, 140, 145, 151. *see*
also Sequential joint maximization
 Nitrous oxide emissions, 87
 Nodal injection charge, 53
 Nuclear power, 88

O

Oceans and thermal inertia, 86
 OECD countries, 67–81, 182–183
 Oil
 greenhouse gas emissions and, 91–92
 price projections, 178
 technological advances and recovery,
 10–11, 26
 Opportunity cost
 transmission capacity rights, 48
 transmission congestion contracts, 37,
 39, 41
 TREES model, 108
 Overlapping generations approach,
 127–128, 130–136
 Overview, 1–7
 end-use modeling, 4–5
 energy-economy interactions, aggregate,
 5–6
 energy-economy interactions, multisec-
 tor, 6
 integrating supply and demand, 5
 interfuel competition, 3–4
 price and non-price demand determi-
 nants, 2–3
 resource supply and depletion, 2
 Own-price elasticity, 4

P

Partial equilibrium model of natural gas al-
 location, 27–29
 Petroleum. *see* Oil
 Photovoltaic power, 88
 Point-to-point service, electricity, 59
 Polling, 177–185
 Power flow dispatch model, 33, 41
 Power function, 15
 Price elasticity
 demand, 2–4
 substitution and, 6
 Prices

auction model for transmission conges-
 tion contracts, 33–45
 choke, 22
 locational, 33–34, 39
 market-clearing, 5, 38, 41
 Process engineering, 4–5
 Production functions, macroeconomic, 69
 Putty-clay, 70, 74
 Putty-putty, 70

R

Ramsey approach, 127
 Random Walk Model (RWM) of Interna-
 tional Oil Prices, 179–180
 Reactive power, 40–42
 Reforestation, 101. *see also* Afforestation
 Rental, land, 104, 107, 111–112, 116–117
 Resources
 depletion, 2
 intertemporal rent, 2
 Royalty taxation, 11

S

Scarf's globally unstable exchange model,
 163–165
 Selfish egoism, 132
 Separating Hyperplane Theorem, 62–63
 Sequential joint maximization, 139–175
 ad valorem taxes, 158
 complementary slackness, 142
 convergence, 141, 147, 151–154
 dual-function model, 148–149
 endowment vectors, 140, 143–145
 exact aggregation, 140
 GAMS code, 159–174
 Hansen's Activity Analysis example,
 165–174
 homotheticity, 143–144
 Manne's Jack-Sprat example, 161–163
 nonlinear production, 157
 nonlinear program solvers and, 141
 Scarf's globally unstable exchange
 model, 163–165
 SLCP, 140, 149–150
 two-by-two exchange code, 159–160
 variational inequality (VI) algorithm,
 140, 150
 Sequential linear complementarity (SLCP)
 algorithm, 140, 149–150
 Sequestration of carbon. *see* Afforestation
 Sheppard's lemma, 149, 157

- SLCP, 140, 149–150
 - Slutsky matrix, 153
 - Social discount rate, 127–128
 - Social welfare
 - defined, 10
 - electrical power network model, 48–50, 55, 59, 63–64
 - technological progress and, 10–27
 - Stringency, decreasing, 79–81
