

CONTRIBUTORS

ROBERT AL-CHOKHACHY is a research fisheries biologist at the US Geological Survey's Northern Rocky Mountain Science Center in Bozeman, Montana. He conducts applied research to improve the understanding of the impacts of land use, nonnative species, and climate change on the persistence, management, and conservation of native fishes.

ISABEL W. ASHTON is an ecologist with the National Park Service Northern Great Plains Inventory and Monitoring Network in Rapid City, South Dakota. She formerly served as director of the Continental Divide Research Learning Center at Rocky Mountain National Park.

BEN BOBOWSKI is chief of the Division of Resource Stewardship at Rocky Mountain National Park. He has also served as chief of resource management for Grant-Kohrs Ranch National Historic Site and as range ecologist for Glen Canyon National Recreation Area.

KARL BUERMEYER is a silviculturist with the US Forest Service, currently located on the Helena and Lewis and Clark national forests in Helena, Montana. He was chair of the Greater Yellowstone Coordinating Committee Whitebark Pine Subcommittee from 2012 to 2015 and is a member of the Whitebark Pine Ecosystem Foundation.

TONY CHANG is a PhD candidate in ecology at Montana State University and a NASA Earth and Space Science Fellow. His research focuses on dynamics of forest trees and their pests, using statistical and process-based ecosystem models to evaluate climate change impacts to the Greater Yellowstone Area.

TINA CORMIER is a remote sensing analyst and research associate at the Woods Hole Research Center in Falmouth, Massachusetts. She formerly worked on the remote sensing team at the Southern Nevada Water Authority in Las Vegas, Nevada.

SCOTT J. GOETZ is deputy director and senior scientist at the Woods Hole Research Center in Falmouth, Massachusetts. He has been conduct-

ing remote sensing science for thirty years, with an emphasis on ecosystem vulnerability to climate and land use change. He is currently science lead of NASA's Arctic Boreal Vulnerability Experiment and is deputy principal investigator of NASA's Global Ecosystem Dynamics Investigation.

JOHN E. GROSS is an ecologist with the National Park Service Climate Change Response Program. He conducts and applies ecological and climate science research to help better manage protected areas in the United States and worldwide.

KEVIN GUAY is a research assistant at the Woods Hole Research Center in Falmouth, Massachusetts, where he uses remote sensing to study northern forest ecosystems.

ANDREW J. HANSEN is a professor in the Ecology Department at Montana State University. He studies how land use and climate change influence plants and animals and implications for ecosystem management, especially in the context of protected areas. He currently is on the science leadership teams for the US Department of the Interior North Central Climate Science Center in Fort Collins, Colorado, and the Montana Institute of Ecosystems.

DYLAN HARRISON-ATLAS is a PhD candidate in the graduate degree program in ecology at Colorado State University. He is an NSF IGERT Fellow studying the vulnerability of freshwater fishes to climate change in the western United States.

NATHANIEL HITT is a research fish biologist in the Aquatic Ecology Branch of the US Geological Survey Leetown Science Center in Kearneysville, West Virginia. Dr. Hitt's research investigates freshwater fish ecology and community ecotoxicology from a landscape perspective, focusing on stream ecosystems in the Appalachian highlands.

PATRICK JANTZ is a research associate II at the Woods Hole Research Center in Falmouth, Massachusetts. His research focuses on forest connectivity and forest vulnerability to climate change in temperate and tropical regions.

VIRGINIA KELLY until recently was the executive coordinator for the Greater Yellowstone Coordinating Committee, a partnership of four federal land managing agencies in the Greater Yellowstone Ecosystem. She is now the forest plan revision team leader for the Custer Gallatin National Forest and is based in Bozeman, Montana.

TODD KOEL is leader of the Native Fish Conservation Program for Yellowstone National Park, holding affiliate faculty appointments at Montana State University and the University of Wyoming. His work focuses on recovery of the Yellowstone Lake ecosystem and the preservation and restoration of cutthroat trout and Arctic grayling in large remote watersheds throughout Yellowstone.

MATTHEW A. KULP is the supervisory fishery biologist for Great Smoky Mountains National Park in Gatlinburg, Tennessee. Matt is a certified fisheries professional who specializes in native fish restoration, fish population monitoring, and conservation genetics of native fish populations.

KRISTIN LEGG is an ecologist and manages the Greater Yellowstone Inventory and Monitoring Network with the National Park Service. She has been working in the field of natural resource science and management since the late 1980s and has an interest in cultivating the integration of science into land management decisions.

SHUANG LI is a research scientist in the Cooperative for Research in Earth Science and Technology at NASA Ames Research Center in Moffett Field, California. He works on remote sensing of terrestrial ecosystems, with an emphasis on the detection of drought impacts and long-term trends driven by climate change. His specific expertise is in applications of optical and radar remote sensing for ecosystem monitoring.

FORREST MELTON is a senior research scientist with the Cooperative for Research in Earth Science and Technology at NASA Ames Research Center in Moffett Field, California. His research focuses on applications of satellite data, ecosystem and agricultural models, and high-performance computing to investigate the impacts of climate change on ecosystems, water resources, and agriculture.

CRISTINA MILESI is scientific director of the Institute for Public Health and Environment, Palo Alto, California. Her research focuses on the effects of environmental change on the health and function of human-dominated ecosystems. Prior to joining the Institute for Public Health and Environment, she was a senior research scientist with NASA Ames Research Center and California State University Monterey Bay.

WILLIAM B. MONAHAN started working on this book as an ecologist with the U.S. National Park Service Inventory and Monitoring Program, which documents the current status and recent trends of park ecosystems to allow managers to make better-informed decisions and to work more effec-

tively with other agencies and individuals for the benefit of park resources. Bill now works for Forest Health Protection, part of the State and Private Forestry Deputy Area of the USDA Forest Service, overseeing the Quantitative Analysis Program for the Forest Health Technology Enterprise Team. Bill's current work focuses on how forests across the United States are impacted by and respond to environmental changes and insect and disease disturbances operating across multiple spatiotemporal scales.

JEFFREY T. MORISETTE is director of the US Department of the Interior North Central Climate Science Center in Fort Collins, Colorado, whose goal is to provide the best available climate science to natural and cultural resource managers in the region.

RAMAKRISHNA NEMANI is a senior earth scientist with NASA Ames Research Center in Moffett Field, California. His interests are in ecological forecasting (Terrestrial Observation and Prediction System) and collaborative computing (NASA Earth Exchange, NEX).

S. THOMAS OLLIFF is a co-coordinator of the Great Northern Landscape Conservation Cooperative and division chief of landscape conservation and climate change for the National Park Service Intermountain Region. He is the natural resources representative on the NPS Revisiting Leopold Implementation Team.

LINDA B. PHILLIPS is a research scientist in the Landscape Biodiversity Lab at Montana State University. She specializes in building and analyzing large spatial databases for biodiversity and climate change studies.

NATHAN B. PIEKIELEK is an interdisciplinary spatial scientist and currently holds the position of geospatial services librarian for the Pennsylvania State University Libraries in University Park. He has a long history working for and with the National Park Service on landscape-scale protected area conservation issues.

ASHLEY QUACKENBUSH is a research scientist with the Cooperative for Research in Earth Science and Technology at NASA Ames Research Center in Moffett Field, California, where her research focuses on utilizing geographic information systems to analyze the impacts of climate change on ecosystems and water resources.

DANIEL REINHART is a supervisory vegetation ecologist at Grand Teton National Park. Dan began studying wildlife-habitat relationships while working for the Interagency Grizzly Bear Study Team, including

grizzly bear use of cutthroat trout spawning streams and the relationships among bears, red squirrels, and whitebark pine. Dan worked as resource management coordinator for Yellowstone National Park and currently oversees vegetation resources in Grand Teton National Park.

ANN RODMAN is acting branch chief for physical resources and climate science at Yellowstone National Park.

BRENDAN M. ROGERS is a postdoctoral fellow at the Woods Hole Research Center in Falmouth, Massachusetts. Using a combination of remote sensing and models, he investigates how forests will be impacted by climate change in terms of their ranges, species composition, and fluxes of water, carbon, and energy.

BRADLEY B. SHEPARD is a senior fish scientist for B.B. Shepard & Associates in Livingston, Montana. He holds adjunct faculty appointments at Montana State University and the University of Idaho. He focuses on conservation of native inland trout of western North America for a diverse group of clients throughout the region.

MARIAN TALBERT is a statistician for the US Department of the Interior North Central Climate Science Center in Fort Collins, Colorado. She works to develop software and tools for various applications, including the exploration of climate data.

MICHAEL TERCEK, PhD, is proprietor of Walking Shadow Ecology in Gardiner, Montana (<http://www.YellowstoneEcology.com>). He specializes in data analysis, computer programming, and climate change ecology.

DAVID M. THEOBALD is a senior scientist at Conservation Science Partners in Fort Collins, Colorado, and adjunct professor at Colorado State University. He applies concepts from geography and landscape ecology and methods from spatial analysis to understand patterns of landscape change and their effects on watersheds, fish and wildlife habitat, and biodiversity.

DAVID THOMA is an ecologist with the National Park Service Inventory and Monitoring Program in Bozeman, Montana.

WEILE WANG is a research scientist with the Cooperative for Research in Earth Science and Technology at NASA Ames Research Center in Moffett Field, California. His research focuses on studying the coupled carbon-climate system with numerical models and remote sensing data sets.

JUN XIONG is a research scientist with US Geological Survey and Northern Arizona University and was recently a postdoctoral fellow at NASA

Ames Research Center in Moffett Field, California. His research focuses on global cropland change, water resources limitations, and impacts to ecosystem processes and food security under a changing climate.

SCOTT ZOLKOS is a PhD student in the Department of Biological Sciences at the University of Alberta in Edmonton, Canada. His graduate specialization in ecology stems from his fascination with the connections between earth systems, how human activities influence the resilience of these systems, and the implications of environmental change for the future of our biosphere.

About Island Press

Since 1984, the nonprofit organization Island Press has been stimulating, shaping, and communicating ideas that are essential for solving environmental problems worldwide. With more than 1,000 titles in print and some 30 new releases each year, we are the nation's leading publisher on environmental issues. We identify innovative thinkers and emerging trends in the environmental field. We work with world-renowned experts and authors to develop cross-disciplinary solutions to environmental challenges.

Island Press designs and executes educational campaigns in conjunction with our authors to communicate their critical messages in print, in person, and online using the latest technologies, innovative programs, and the media. Our goal is to reach targeted audiences—scientists, policymakers, environmental advocates, urban planners, the media, and concerned citizens—with information that can be used to create the framework for long-term ecological health and human well-being.

Island Press gratefully acknowledges major support of our work by The Agua Fund, The Andrew W. Mellon Foundation, The Bobolink Foundation, The Curtis and Edith Munson Foundation, Forrest C. and Frances H. Lattner Foundation, The JPB Foundation, The Kresge Foundation, The Oram Foundation, Inc., The Overbrook Foundation, The S.D. Bechtel, Jr. Foundation, The Summit Charitable Foundation, Inc., and many other generous supporters.

The opinions expressed in this book are those of the author(s) and do not necessarily reflect the views of our supporters.

Wildland ecosystems are undergoing unprecedented climate-induced change. Understanding the ever-evolving science needed to manage large-scale tracts of public and private wildlands effectively can be daunting for administrators. This book is a unique collaboration between scientists and land managers to bring innovative scientific approaches and useful case studies that help them make informed decisions about ecosystems stressed by climate change and human pressures.

*Advance praise for **Climate Change in Wildlands***

“*Climate Change in Wildlands* is an important contribution to resource managers and scientists facing the daunting challenges of climate change. Through work in two mountain ranges—Rockies and Appalachians—the authors illustrate an approach to climate change adaptation informed by analyses, decision support tools, and dialogue with land managers to identify threats to resources and options for responding. Climate change presents unprecedented challenges to those responsible for stewardship of our public lands. This volume provides important examples and guidance for navigating those challenges.”

—**JONATHAN B. JARVIS**

“There has been much talk about linking science to wildlands management under climate change. This outstanding book actually demonstrates how to do so, providing clear guidance for adaptation planning, thoughtful how-to advice, and excellent case studies.”

—**FRANK DAVIS**, Director, National Center for Ecological Analysis and Synthesis

“A down-to-earth scientific analysis of impending impacts of climate change on American wildlands and ecosystems. *Climate Change in Wildlands* is sobering yet encouraging, because it provides insights for proactive management of these precious ecological resources. This is a fine book that will be the source to turn to for decades to come.”

—**THOMAS E. LOVEJOY**, University Professor of Environmental Science and Management, George Mason University and National Geographic Conservation Fellow

ANDREW J. HANSEN is a professor in the Ecology Department at Montana State University in Bozeman. **WILLIAM B. MONAHAN** is the quantitative analysis program manager for the USDA Forest Service in Fort Collins, Colorado. **DAVID M. THEOBALD** is a senior scientist at Conservation Science Partners in Fort Collins. **S. THOMAS OLLIFF** is the division chief of Landscape Conservation and Climate Change for the National Park Service in Bozeman.
