**DNA Fingerprinting:
Approaches and Applications**

Edited by

Terry Burke, *Univ. of Leicester, GB*
Gaudenz Dolf, *Univ. of Berne, Switzerland*
Alec J. Jeffreys, *Univ. of Leicester, GB*
Roger Wolff, *USCF - HSE 1556, San Francisco, USA*

1991. 416 pages. Hardcover, ISBN 3-7643-2562-3, (EXS 58)

Contents:

Molecular Genetics of Hypervariable DNA

Principles and recent advances in human DNA fingerprinting – Generation of variability at VNTR loci in human DNA – Human VNTR sequences in porcine HTF-islands – Oligonucleotide fingerprinting using simple repeat motifs: a convenient, ubiquitously applicable method to detect hypervariability for multiple purposes – DNA fingerprinting of the human intestinal parasite *Giardia intestinalis* with hypervariable minisatellite sequences – Human variable number of tandem repeat probes as a source of polymorphic markers in experimental animals – DNA fingerprinting: the utilization of minisatellite probes to detect a somatic mutation in the Proteus syndrome – Genetic variability of satellite sequence in the dipteran *Musca domestica*.

Population Genetics and Evolutionary Biology

Analysis of population genetic structure by DNA fingerprinting – Population genetics of hypervariable loci: analysis of PCR based VNTR polymorphism within a population – Population genetic data determined for five different single locus minisatellite probes – Multilocus and single locus minisatellite analysis in population biological studies – Helpers-at-the-nest in European Bee-eaters (*Merops apiaster*): a genetic analysis – Cloning, characterization and evolution of Indian peafowl *Pavo cristatus* minisatellite loci – Use of sex-linked minisatellite fragments to investigate genetic differentiation and migration of North American populations of the peregrine falcon (*Falco peregrinus*).

Economically important Animals and Plants

Hypervariable DNA markers and their applications in the chicken – Cloning of hypervariable minisatellite and simple sequence microsatellite repeats for DNA fingerprinting of important aquacultural species of salmonids and tilapias –

Genetic factors accountable for line-specific DNA fingerprint bands in quail – Identification of markers associated with quantitative trait loci in chickens by DNA fingerprinting – Two dimensional DNA fingerprinting in animals – Applications of DNA fingerprinting in plant breeding – Oligonucleotide fingerprinting in plants and fungi – The isolation and characterisation of plant sequences homologous to human hypervariable minisatellites.

Implementation of DNA Typing

DNA fingerprinting; a biotechnology in business – DNA fingerprinting: its applications in forensic case work – Tracking the violent criminal offender through DNA typing profiles. A national database system concept – The quality control of cell banks using DNA fingerprinting – Detection of amplified VNTR alleles by direct chemiluminescence: application to the genetic identification of biological samples in forensic cases – Genetic typing using automated electrophoresis and fluorescence detection.

Advances in Life Sciences

**Methods
in Protein Sequence Analysis**

Edited by
H. Jörnvall
J.-O. Höög

A.-M. Gustavsson

Karolinska Institute, Stockholm, Sweden (Eds)

1991, 408 pages, Hardcover, ISBN 3-7643-2506-2, (ALS)

This book focuses on the methodological and interpretational aspects of protein analysis. Topics covered include novel approaches to sequencer instrumentation, different aspects of peptide purification, as well as new results in capillary electrophoresis, proteolysis, special chemical problems and modified residues. Mass spectrometry – including ion evaporation ionization and plasma desorption mass spectrometry – data bank comparisons and predictive methods, synergism with DNA analysis of three-dimensional structures, folding and interpretations are also treated. New possibilities are offered by emerging techniques such as C-terminal sequence analysis, the usefulness of capillary electrophoresis, mass spectrometry, more sophisticated sequencers and other instruments, as well as the impressive collection of structures available in data banks and valuable conclusions drawn from comparisons and functional correlations.

From the Contents:

- Sequencer methodology and instrumentation
- Sample preparation and analysis
- Modified residues, chemical problems and synthetic peptides
- Proteolysis
- Mass spectrometry
- Synergism with DNA analysis
- Predictions, data banks, patterns and tertiary structures
