

Index

A

Agent-based models

basic model

- bankrupt, 151
- bankruptcies rate, 154, 155
- decision making, 151
- orders execution, 151
- price movement, 150
- ten welfare trajectories, 152, 153
- wealth distribution, 152, 153
- wealth trajectories, 154, 155

bear market, 148

black swans

- average welfare, 156
- black swans seekers, 151–152
- ordinary traders, 151–152
- risk of bankruptcy, 156, 158
- welfare distribution, 156, 157

bull market, 148

econophysics, 217

exotic strategies, 148

fundamental and technical analysis, 147

market and agents, 148–149

trading strategies, 147

U.S. S&P500 index data, 149–150

Asian financial crises (1997), 159

Asset risk, 86, 87

Average maximal flow (AMF), 162, 168

Average shortest path length (ASPL), 162, 167, 168

B

Banking management

asset liability management, 142

bank branches network management, 142

banking and sovereign debt crisis, 140

Basel II and III, 140–141

CAMELS framework, 141

credit risk rating, 142

customer relationship management, 142

electronic banking services, 142

evaluation criteria, 141

loan portfolio optimization, 142

MCDA techniques, 141

operational risk, 142

PDA techniques, 142

Banking network model

asset risk, 86

banks hedge, 96–97

break-even condition, 94, 99

CCP/CDS, 88

contagious equilibrium, 101

contagious system, 94–95

counter-party insurance, 91

counter-party insurance payoff, 98

counter-party risk, 86

CVA, 88

debt reduction, 102

hedging, 86

liquidity risk, 87

long-term lending, 100–101

long-term real asset yields, 88

maximum amount borrowing, 91

OTC contracts, 86–87

parameter restrictions, 90

private incentive, 92

probability of bad state, 89–91

risky autarky, 93–94

safe autarky, 95–96

social benefits, 93

- Banking network model (*cont.*)
 systemic risks, 87
 unhedged risk, 97
 unit investment, 88–89, 91–92
- Baxter–King filter, 266
- Black–Scholes–Merton arbitrage-driven models, 230
- Black swans model
 average welfare, 156
 black swans seekers, 151–152
 ordinary traders, 151–152
 risk of bankruptcy, 156, 158
 welfare distribution, 156, 157
- Break-even condition, 94, 95, 99
- Brownian motion model, 204
- Bull market, 148
- C**
- Capital, assets, management, earnings, liquidity, sensitivity (CAMELS), 141
- Central counter-parties (CCP), 88
- Central government debt (CGD), 170, 174, 177
- Classic sphere packing problem, 2, 5
- Complex and dynamical systems
 characteristics, 209
 definition, 208
 deterministic systems, 210–211
 features, 209
 non-deterministic systems, 211–212
 nonlinear interactions, 209–210
 properties of, 209
 structure, 212–214
- Complexity and endogenous risk
 Black–Scholes–Merton arbitrage-driven models, 230
 Bretton Woods rule, 229
 homogeneous markets, 231
 JPY exchange rate, 229
 lack of diversity, 232
 market crash, 229
 Markowitz’s and Merton’s lines, 229
 mean–variance relationship, 230
 risk–return trade-off, 231
 shifting risk, 227
 stochastic/random process, 231
 terrorist 9/11 attacks, 229
 traditional risk models, 231
- Complexity theory
 econobiology (*see* Econobiology)
 econophysics (*see* Econophysics)
 entropy theory, 202
 financial factors, 206
 fragility and instability, 208
 funding and leverage, 208
 global bank network, 205–207
 history of, 215
 market agent, 202
 standard macro models, 203
 vs. standard theory, 202
 stylized facts, 204–205
 tendency of regulators, 208
- Complex networks theory, 278–279
- Composite centrality framework
 economic indicator, 164
 measure standardisation
 Box–Cox transformation, 165
 mean, 165
 national GDP, 166–167
 order, skewness and variance, 165
 network science and economics, 164
 radial and medial standard measure set, 167, 168
- Cont–Bouchaud model, 217
- Coordinated Portfolio Investment Survey (CPIS), 168, 169, 177
- Counter-party risk, 86–91, 95–98
- Credit default swaps (CDSs), 88, 103, 201, 223
- Credit risk transfer (CRT), 201
- Credit value adjustment (CVA), 88
- D**
- Danish payment system, 217
- Data smoothing methods
 concave/convex trend, 108
 Gompertz curve, 108
 growth/sigmoid curves, 108
 inflection point, 108
 numerical testing
 CPU time, 120, 121
 Fortran packages L2MCX and L2CXCXV, 114
 inequalities, 120
 Intel Visual Fortran Composer XE2013, 114
 Karush–Kuhn–Tucker residuals, 120, 121
 second divided differences, 115, 118–119
 third divided differences, 115–117
 random errors, 107
 second divided differences
 algorithm implementation, 113–114
 convex and concave section, 113
 convexity/concavity constraints, 112
 α_j calculation, 114

- least squares fit, 122, 123
- linear inequality constraints, 113
- optimal approximation, 112–113
- vector calculation, 112
- sigmoid curves, 109
- sigmoid function, 107
- third divided differences, 108–109
 - constraint functions, 110
 - Karush–Kuhn–Tucker conditions, 111
 - least squares fit, 121, 122
 - non-decreasing marginal rates, 110
 - quadratic programming algorithm, 111
 - unique Lagrange multipliers, 110–111
 - vector calculation, 109
- Design of experiments (DOE), 1
- Dominating Set (DS), 270–271
- Dutch payment system, 217
- Dynamic network economic model
 - continuous-time dynamic model, 241
 - equilibrium models, 240
 - Euler method
 - equilibrium prices and quality levels, 255–256
 - explicit formulae, 254–255
 - general iterative scheme, 254
 - quality levels, 261, 262
 - single content provider, two network providers, 257–259
 - two content/network providers, 259–261
 - two content providers, single network provider, 256–257
 - Future Generation Internet, 240–241
 - internet age, 240
 - PDS model, 241
 - service-oriented internet
 - content providers behavior, 244–245
 - direct demand functions, 242
 - inverse demand/price functions, 242
 - modeling of quality, 243–244
 - monotonicity (*see* Monotonicity)
