Γ-convergence, 8, 177, 269
Γ-convergence of Ginzburg-Landau, 271
Γ-convergence along a trajectory, 277
Γ-convergence of gradient-flows, 275
Γ^+-convergence, 245

tree-like Gasket, 152

approximate differentiability, 92
approximate discontinuity set, 91
approximate jump point, 91
approximate limit, 91
asymptotic expansion in Γ^+-convergence, 256

Bernoulli free boundary problem, 243
Blake-Zisserman model, 36
Bochner identity, 299
boundary layer, 22

Cantor part, 91
Cantor set, 152
capacitary potential, 239
capacity, 239
clearing out, 299
co-area formula, 90, 122
coerciveness, 82
collisions of vortices, 289
compact set, 82
Concentration-compactness alternative, 237
conservative solution, 278
convergence of discrete functions, 8
convex functional, 8
correctors, 215
crease energy, 52
curvature equation, 312

De Giorgi's Rectifiability Theorem, 90
De Giorgi-Letta measure criterion, 121
density, 297
diffusion driving process, 225
direct methods, 83
Dirichlet form, 155
dynamics of vortices, 286

eigenform of a fractal, 161

finitely ramified fractals, 152
function of bounded variation, 58, 88
function, discrete, 8
fundamental solution, 239

Gasket, 142
generalized Sobolev inequality, 244
Ginzburg-Landau simplified model, 269
gradient-flow solution, 278
Green's function, 253

harmonic center, 255
harmonic extension, 150
harmonic radius, 255
harmonic transplantation, 260
higher-order Γ-limit, 55
homogenization of perforated domains, 191
homogenization on the Gasket, 173
homogenization, discrete, 34

integral representation, 125
interior boundary, 90
invariant measure, 226
isoperimetric inequality for the capacity, 240

jump set, 38, 91

Lennard-Jones potentials, 52
localization of the generalized Sobolev inequality, 249
long-range interactions, 10, 14
lower density, 297
lower semicontinuity, 82
lower semicontinuous envelope, 83

maximum correlation coefficient, 212
mean curvature, 311
minimal surface, 311
mixing coefficients, 211
modulus estimates, 308
monotonicity formula, 295
multi-phase limit, 28, 29

nearest-neighbour interactions, 9, 11
nesting property, 156
next-to-nearest neighbour interactions, 12
non-local limit, 31

one-dimensional BV functions, 92
one-dimensional relaxation, 93
oscillating Dirichlet boundary conditions, 190
oscillating Fourier boundary conditions, 193

perimeter, 90
Perron-Frobenius Theorem, 183
phase transition, 22
piecewise-Sobolev functions, 38
Pohozaev identity, 295
potential estimates, 308

quasiconvex function, 113

recovery sequence, 246
rectifiable set, 90, 307
reduced boundary, 90
regularity theorems for Ginzburg-Landau, 299
relaxation, 83
renormalization factor, 163
renormalization group, 58
renormalization operator, 164
renormalized energy, 273
rescaled energy, 295
Robin function, 254, 263

SBV, 85
scaling properties, 294
second-difference energies, 35
sequential coerciveness, 82
set of finite perimeter, 90
Sierpinski Carpet, 152
Sierpinski Gasket, 142
small energy regularity, 299
snowflake, 152
Sobolev inequality, 235
special functions of bounded variation, 85, 92
strange term, 190
strongly connected fractal, 181
subadditive envelope, 96, 132

uniform mixing coefficient, 212
upper density, 297

vector measure, 86
Vicsek set, 152
vortex, 268

weak mean curvature, 311
weak* convergence, 89

Editor in Chief: Franco Brezzi

Editorial Policy

1. The UMI Lecture Notes aim to report new developments in all areas of mathematics and their applications - quickly, informally and at a high level. Mathematical texts analysing new developments in modelling and numerical simulation are also welcome.

2. Manuscripts should be submitted (preferably in duplicate) to
   Redazione Lecture Notes U.M.I.
   Dipartimento di Matematica
   Piazza Porta S. Donato 5
   I – 40126 Bologna
   and possibly to one of the editors of the Board informing, in this case, the Redazione about the submission. In general, manuscripts will be sent out to external referees for evaluation. If a decision cannot yet be reached on the basis of the first 2 reports, further referees may be contacted. The author will be informed of this. A final decision to publish can be made only on the basis of the complete manuscript, however a refereeing process leading to a preliminary decision can be based on a pre-final or incomplete manuscript. The strict minimum amount of material that will be considered should include a detailed outline describing the planned contents of each chapter, a bibliography and several sample chapters.

3. Manuscripts should in general be submitted in English. Final manuscripts should contain at least 100 pages of mathematical text and should always include
   - a table of contents;
   - an informative introduction, with adequate motivation and perhaps some historical remarks: it should be accessible to a reader not intimately familiar with the topic treated;
   - a subject index: as a rule this is genuinely helpful for the reader.

4. For evaluation purposes, manuscripts may be submitted in print or electronic form (print form is still preferred by most referees), in the latter case preferably as pdf- or zipped ps- files. Authors are asked, if their manuscript is accepted for publication, to use the LaTeX2e style files available from Springer's web-server at ftp://ftp.springer.de/pub/tex/latex/mathegl/mono.zip

5. Authors receive a total of 50 free copies of their volume, but no royalties. They are entitled to a discount of 33.3 % on the price of Springer books purchased for their personal use, if ordering directly from Springer.

6. Commitment to publish is made by letter of intent rather than by signing a formal contract. Springer-Verlag secures the copyright for each volume. Authors are free to reuse material contained in their LNM volumes in later publications: A brief written (or e-mail) request for formal permission is sufficient.
