INDEX

A D D E N D A

1. p.2. It was recently shown by I.Ruzsa (On the uniform and almost uniform distribution of $(a_n x)$ mod 1, Sém.Théorie des Nombres,1982-3,exp.20,Université de Bordeaux 1983.) that there exists a sequence a_n of integers which is UD(mod N) for all N whereas $(a_n x)$ is UD(mod 1) for no real x.

2. p.3. A study of uniform distribution of sequences of algebraic integers was carried out in H.NIEDERREITER,S.K.LO, Uniform distribution of sequences of algebraic integers, Math.J.Okayama Univ.,18,1975,13-29.

3. p.10. Cf. also H.NIEDERREITER, On a class of sequences of lattice points, J.Number Theory 4,1972,477-502.

4. p.26, line +6. H.NIEDERREITER [70] should be also quoted here.

5. p.32. M.Hall's result was generalized by H.NIEDERREITER (On the cycle structure of linear recurring sequences, Math. Scand.,38,1976,53-77).

6. Problem I, stated on p.9 has just been solved independently by E.Rosochowicz and I.Ruzsa.
