Algorithms and Combinatorics

Editors: R.L. Graham, B. Korte, L. Lovász

Combinatorial mathematics has substantially influenced recent trends and developments in the theory of algorithms and its applications. Conversely, research on algorithms and their complexity has established new perspectives in discrete mathematics. This new series is devoted to the mathematics of these rapidly growing fields with special emphasis on their mutual interactions.

The series will cover areas in pure and applied mathematics as well as computer science, including: combinatorial and discrete optimization, polyhedral combinatorics, graph theory and its algorithmic aspects, network flows, matroids and their applications, algorithms in number theory, group theory etc., coding theory, algorithmic complexity of combinatorial problems, and combinatorial methods in computer science and related areas.

The main body of this series will be monographs ranging in level from first-year graduate up to advanced state-of-the-art research. The books will be conventionally type-set and bound in hard covers. In new and rapidly growing areas, collections of carefully edited monographic articles are also appropriate for this series. Occasionally there will also be "lecture-notes-type" volumes within the series, published as *Study and Research Texts* in soft cover and camera-ready form. This will be mainly an outlet for seminar notes, drafts of textbooks with essential novelty in their presentation, and preliminary drafts of monographs.

Prospective readers of the series **Algorithms and Combinatorics** include scientists and graduate students working in discrete mathematics, operations research and computer science.

Forthcoming titles:

M. Grötschel, L. Lovász, H. Schrijver, **Geometric Algorithms and Combinatorial Optimization**

K. Murota, **Structural Solvability and Controllability of Systems**

A. Recki, **Matroid Theory and its Applications**

J. Nešetřil, V. Rödl (eds.), **Mathematics of Ramsey Theory**
