Plate 1  The different heads of ISO 19115 (See also Fig. 1.1 on Page 6)

Plate 2  Illustration of the three descriptor types of ISO 19115 (See also Fig. 1.2 on Page 7)
Plate 3  Geographical description of a resource in ISO 19115 (See also Fig. 1.4 on Page 10)

Plate 4  Textual and cartographical responses to a multicriteria request (See also Fig. 1.5 on Page 12)
Plate 5  Example of a connection to a Postgis database with the free software application Quantum GIS (See also Fig. 1.6 on Page 14)

Plate 6  Australia’s marine jurisdiction (See also Fig. 2.1 on Page 18)
Regional marine planning is being undertaken over a number of regions (See also Fig. 2.2 on Page 21)
Plate 8  Map produced to show port limits under the customs act – Fremantle, Western Australia (See also Fig. 2.4 on Page 24)

Plate 9  Extent of overlapping interests and treaty boundaries in the Timor Sea (See also Fig. 2.5 on Page 25)
Plate 10  Proposed web mapping architecture for AMSIS (See also Fig. 2.6 on Page 26)

Plate 11  Map of Lagos Lagoon with the rivers and creeks (See also Fig. 3.1 on Page 31)
Plate 12  Example of the cartographic differences being identified by SeaZone as follow up to the ICZMap pilot project (See also Fig. 5.1 on Page 53)

Plate 13  Example of the joined marine geographic information created by SeaZone (land data courtesy of Ordnance Survey) (See also Fig. 5.2 on Page 54)

Plate 14  The project logo (a) and a page of the virtual permanent conference (b) (See also Fig. 7.1 on Page 66)
Plate 15  Technical architecture of the marine geospatial data infrastructure (See also Fig. 8.1 on Page 80)

Plate 16  Map generated by the COINAtlantic web mapping application (www.coinatlantic.ca) (See also Fig. 8.2 on Page 81)

Plate 17  Cartography elements and base map (See also Fig. 11.1 on Page 111)
Plate 18  Example of daily map with the oil spill distribution (See also Fig. 11.4 on Page 114)

Plate 19  Position of the existing and planned plants along the Sicilian coasts and the distribution of species and provinces (See also Fig. 12.1 on Page 119)
Plate 20  Detail of plants and biotopes (circled in yellow-green) distributed along the Tyrrhenian coast in the province of Messina (brown in Fig. 12.1.) (See also Fig. 12.2 on Page 124)

Plate 21  Nine examples of coastal geomorphology in Mexico (left to right and top to bottom): Cancún, Quintana Roo; Progreso, Yucatán; Huatulco, Oaxaca; Acapulco, Guerrero; Puerto Vallarta, Jalisco; Manzanillo, Colima; San José de los Cabos, Baja California Sur; Mazatlán, Sinaloa; and Hecelchakán, Campeche (See also Fig. 14.1 on Page 140)
Plate 22 (A) Digital elevation map of the Yucatan Peninsula within Mexico; (B) Proximity, shoreline buffer 20 km offshore and inland; (C) Area below 50 m elevation; (D) Hydrological subwatersheds totally or partially within the 20 km buffer (See also Fig. 14.2 on Page 147)
Plate 23  (A) Shoreline and government administrative boundaries overlaid with climatic regions contained within watershed boundaries; (B) Shoreline and government administrative boundaries overlaid with land uses contained within climatic regions and watershed boundaries; (C) Shoreline and government administrative boundaries overlaid with NDVI values contained within climatic regions and watershed boundaries; (D) Close-up of Carmen climatic region (Aw1), including sub-watersheds; (E) Carmen climatic region showing selected watersheds totally or partially within 20 km SL buffer; (F) Carmen climatic region overlaid with five NDVI classes within watershed boundaries, as well as municipal and state boundaries (See also Fig. 14.3 on Page 148)
Plate 24  (a) An interactive hypermedia animation with several forms of interactivity generated with Erdas Imagine 8.5 using the ParallelGraphics CortonaR VRML Client used to view VRML model. (b) An ArcView 3.3, project using raster Ordnance Survey (OS) map data at a scale of 1:50,000 with hotlinks to 21 ground truth colour photographs at 1280×960 pixels resolution. (c) The third example is a video clip (11.4 MB file size, with a duration of 25 s, comprising 375 frames, at 15 frames per second, using the DivX High Definition Profile, at a resolution of 768×512) generated by the Bryce 5 software (See also Fig. 16.2 on Page 181)
Plate 25  The Wadden Sea area (Trilateral cooperation area) (See also Fig. 18.1 on Page 198)

Plate 26  Salt marsh zones in the Netherlands and Germany. The used geographical and attribute data is directly comparable (Essink et al. 2005) (See also Fig. 18.2 on Page 201)
Plate 27  Salt marsh zones (NLPV 1997) combined with migratory bird count sites (NLWKN 2004) in the Leybucht Lower Saxony, Germany (See also Fig. 18.3 on Page 202)

Plate 28  Distribution of intertidal blue mussel beds in the Wadden Sea. Absolute (ha) and relative (%) of intertidal area covered by blue mussel beds (Essink et al. 2005) (See also Fig. 18.4 on Page 203)
Plate 29  Display of water depth from model input in GIS (After Ng (2004)) (See also Fig. 19.5 on Page 215)

Plate 30  Shipping traffic density distribution through gridding (See also Fig. 21.1 on Page 233)

Plate 31  Fishing versus shipping traffic proportion distribution in Atlantic Canada (See also Fig. 21.2 on Page 233)
**Plate 32** Single Kernel density analysis of fishing incidents (See also Fig. 21.3 on Page 236)

**Plate 33** Fishing incident rate distribution using Dual Kernel density interpolation (See also Fig. 21.4 on Page 236)

**Plate 34** Schematic diagram representing the simplifications used by the carbon deposition model. The sea loch is represented by a rectangular basin with identical physical characteristics to the real system. The tidal current amplitude decreases from $U_0$ at the mouth to zero at the head, with values at each site, $U_S$, calculated accordingly. Fish farms are represented by the filled rectangular block, with the areas of impacted seabed denoted by the filled ellipses. All other parameters and variables are described in the text (See also Fig. 22.1 on Page 242)
Plate 35  Area of detail from method three combined zones (See also Fig. 23.2 on Page 250)
Plate 36  Functionality of Marxan compared with user needs for zoning (See also Fig. 23.3 on Page 252)

Plate 37  Coastal zone in Slovenia (See also Fig. 24.1 on Page 256)
Plate 38 Existing legal regimes as decision support tool for managing sensitivity areas for national contingency plan (See also Fig. 24.2 on Page 260)
Plate 39  Spatial representation of land and sea interaction as functional connected areas (See also Fig. 24.3 on Page 261)
Plate 40  Group model of decision stages in the management of coastal geohazards (See also Fig. 25.1 on Page 268)
Plate 41  Study area location (See also Fig. 26.1 on Page 276)

Plate 42  1996 aerial survey after georeferencing (See also Fig. 26.2 on Page 280)
Plate 43  Visual analysis of the 1965 survey (See also Fig. 26.3 on Page 281)

Plate 44  Structure of Matlab analysis tool (See also Fig. 26.4 on Page 282)
Plate 45  Preliminary results of Matlab analysis and overlapping in GIS database (See also Fig. 26.5 on Page 282)

Plate 46  Geological (i.e. lithology, fault lines) characteristics of Paros Island (See also Fig. 27.1 on Page 287)
Plate 47  Geographical and morphological characteristics of Paros Island (See also Fig. 27.2 on Page 288)
Plate 48  Coastal slopes, coastal types and the sectors defined according to effective fetch of incoming wind-generated waves (See also Fig. 27.3 on Page 292)

Plate 49  The morphology of Paros Island at (a) 10,000 yr BP, when sea level was ca. 54 m lower than its present stage (left) and (b) 6,000 yr BP, when sea level was ca. 6 m lower than its present stage (right) (See also Fig. 27.4 on Page 294)
Plate 50  The study area situated in the Central Aegean, showing the rates and direction of motion of Cyclades during the Quaternary and the major submarine fault zones (See also Fig. 28.1 on Page 298)

Plate 51  From left to right: (a) Eroding beachrock in Syros. (b) Submerged Roman fishtanks in Naxos. (c) Eroding Myceanean wall at sea level in the city of Naxos (See also Fig. 28.2 on Page 301)
Plate 52  The topography, the drainage system and the geomorphological units of Meganisi island (See also Fig. 29.1 on Page 306)
Plate 53  (A) The geological map of the Meganisi island (I.G.M.E., 1963, 1994), modified by the authors. (B) The wave energy map. (C) The final coastal hazard risk map of Meganisi island. (D) A rodograme of faults orientation. (E) A rodograme of coast orientation (See also Fig. 29.3 on Page 311)
Plate 54  Location of the study area and aerial photographs of Cascais bay beaches before and after the construction of the marina (See also Fig. 30.1 on Page 316)
Plate 55  Histograms of occurrence for the offshore wave regime parameters: a) direction; b) significant height; and c) period (See also Fig. 30.2 on Page 318)
Plate 56 Variable factor of the resultant wave power, for the situations BM and AM, in front of the beaches: Ribeira, Raínha, N. Srª da Conceição and Moitas (See also Fig. 30.4 on Page 323)
Plate 57  The location of the study area, the development of drainage basin and the Dams of Acheloos basin (See also Fig. 31.1 on Page 326)
Plate 58  The delta plain. Geomorphological and land use changes from 1960 (Fig. 2A) to 2004 (Fig. 2B), based on aerial photos and satellite images interpretation, and field mapping. Fig. 2C: Digital model of the submarine environment (See also Fig. 31.2 on Page 329)
Plate 59  Zooming on geomorphological and land use changes as have been observed by aerial photos and satellite images (1960–2000), in delta plain (See also Fig. 31.3 on Page 330)

Plate 60  Current land use and land cover for the Blakeney-Cley section of the study area (See also Fig. 32.2 on Page 341)
Plate 61  Simulated 2050 land cover/land use for Policy Option 3 and the high sea level rise scenario: same area as Fig. 2 (See also Fig. 32.3 on Page 341)

Plate 62  Sample results from the MCA with different criteria weighting systems (a) and (b). The weighting systems are illustrated in the pie-chart and the resultant scores for each policy shown for two different sea level rise (SLR) scenarios (See also Fig. 32.4 on Page 344)
Plate 63  Conceptual model of the Catalan coastal zone GIS (See also Fig. 34.1 on Page 362)

Plate 64  Conceptual entities and relations of the biogeographic module (See also Fig. 34.2 on Page 364)

Plate 65  Marine hexagon model of anthropogenic impact indicators and fish species resilience of the Catalan coast (See also Fig. 34.4 on Page 367)
Plate 66  Gridded population density of Asia (based on CIESIN, GPW3 2000), showing concentration in river valleys and on megadeltas (See also Fig. 36.1 on Page 380)

Plate 67  The Red River Delta; (a) JERS radar imagery of the delta showing the complexity of land-use, and (b) an interpretation of subaerial delta geomorphology that shows distinct sectors of the delta dominated by different processes (based on Mathers and Zalasiewicz, 1999) (See also Fig. 36.2 on Page 382)
Plate 68  The delta of the Ganges-Brahmaputra-Meghna delta; (a) DTM determined from SRTM, and (b) MODIS image of delta (See also Fig. 36.3 on Page 383)

Plate 69  The delta of the Irrawaddy River, Myanmar; (a) Digital terrain model (DTM) derived from Shuttle Radar Topography Mission (SRTM) data; (b) JERS radar imagery, showing the tide-dominated “Mouths of the Irrawaddy” (See also Fig. 36.4 on Page 384)
Plate 70 DTM of (a) Indus, (b) Pearl, (c) Huanghe, (d) Chao Phraya, (e) Mekong, and (f) Changjiang deltas based on Shuttle Radar Topography Mission (SRTM) data (after Woodroffe et al., 2006) (See also Fig. 36.5 on Page 385)

Plate 71 The Red River Delta; (a) DTM derived from SRTM; (b) gridded population density for 2015 using estimates of population increase (based on GPW3, CIESIN) (See also Fig. 36.6 on Page 387)
