Index

Note: The letters ‘f’ and ‘t’ following locators refer to figures and tables respectively.

A
AANEM, 31
Action current, 11, 14f, 19
Action potential, 11, 18–19, 41, 57, 86, 102, 132, 138, 141
Adson’s maneuver, 37–39, 39f, 49, 58, 152–153, 159
Allen test, 30, 37, 39f, 54, 56–57, 58f–59f, 60, 61t, 65–66, 71f–73f, 74–75, 74t, 156
Amber, 2, 4, 24–25
Animal electricity, 6–11, 11f, 15, 18, 23–24
Arimina, 3
Auxiliary muscles of respiration, 150
Axillary nerve, 56–57, 61t, 70, 149, 153

B
Barr, J. S., 77
Basmajian, J. V., 20, 31
Battery, invention of (Volta), 9
Bernstein, J., 10, 12–15, 14f, 16f, 18, 31
Bernstein’s theory, 10, 15, 18
Botox, 67
Botulinum neurotoxin type B (Bt-B), 57, 59, 65–67, 68f, 69–70, 71f–72f, 72–74, 73f, 74t, 106–107, 106f, 107t, 109t
clinical study, 67
inhibition of acetylcholine at neuromuscular junction, 67
local action, 67
Brachial plexus, 37, 38f–39f, 49, 50f, 53, 55–56, 60, 67, 68f, 149
Bt-B, see Botulinum neurotoxin type B (Bt-B)

C
Capacitor-theory, see Muscle-as-Leyden-jar theory (Galvani)
Carpal tunnel syndrome, 48, 114, 145, 147
Cathode ray tube, invention, 19
Cauda equina, 81, 126, 130, 136, 142
Characteristics of piriformis syndrome, 95, 101t, 103t
Claudication, 49, 81, 133
Clavicle, 37, 49, 55, 58, 150
Contralateral, 37, 39f, 48, 50f, 53–54, 57, 85, 88, 92, 92f, 98, 116t, 118t, 147, 153t, 154, 157
Coracoid process, 37, 51, 55–56, 55f, 58
Costoclavicular syndrome, see Neurological thoracic outlet syndrome (NTOS)
Crude electrostatic induction machines, 5

D
De Magnete, 4
Denervation, paraspinial, 40, 42–43, 57, 85–86, 106, 143
D’Etilles, 10
Diagnosis of exclusion, 33–37, 39, 47–48, 56, 58, 60, 77–78, 86, 96, 100, 161
See also Piriformis syndrome; Thoracic outlet syndrome
Diagnostic methods for piriformis syndrome, 41–42
EMG techniques, 41, 42f
neural scans, 41–42
physical therapy, 41
Differential diagnosis, 28, 33, 36, 48–49
Differential rheotome (Bernstein), 12–13, 13f
Distal motor latency, 60, 89, 114, 147
Dubois-Reymond, 11, 13
Dynamic electrodiagnosis “diagnosis of exclusion,” fallacy in, 33–37 case of a 37-year-old woman,
hypothesis, 34, 35f
differential diagnosis, 33
failure to identify dual diagnosis, 36f
infectious disease, 33
symptom as a diagnostic entity, 36
Dynamic electrodiagnosis (cont.)
  lumbar spinal stenosis vs. herniated disc, 43–44
  normal image of everything the fat, 42–43
  piriformis syndrome, 39–42
diagnostic methods, 41–42
  EMG findings in L4-5-S1- S2 muscles, 40
  normal CT and no paraspinal denervation, conclusions, 41
  position for piriformis test, 40f
  thoracic outlet syndrome, 37–39
  Adson’s maneuver, 37–38
  brachial plexus, 37, 38f
electromyographers, nerve conduction study, 38
  neurological effect of provocative maneuvers, 37–38

E
Electrica, 4
The electric fish (torpedo), 3–6, 3f–4f, 25, 31
  applications, 3
  arimna, 3
  narke, 3
  organs generating electrical charge, 4f
  “technology,” 3
  Electricity in medicine
  animal electricity controversy, 6–10
    “coup de grace” to Galvani’s theory, experiments, 10
  electricity and muscle contraction in frogs, study (Galvani), 6–7, 6f
  frogs’ legs’ sciatic nerves in contact (Galvani), 7–8, 8f
  invention of battery (Volta), 9
  muscle-as-Leyden-jar theory (Galvani), 7
  Volta’s postulations of electricity, 7
  The Bible, 2
  electricity through history of minerals
    amber, properties, 2
    “electric” (elektron), 2
    Neanderthals, 2
  electrophysiology through history of animals
    the electric fish, 3–4
  evidence of electricity through history, 4–6
cases of reanimation, 5
  electric and magnetic forces, distinguishing (Gilbert), 4
  electricity generated from muscles (Redi), 4, 4f
  Leyden jar, 5
  man-made approximations of electricity, 5
treatment of paralysis, 5
technological advances in medicine, 10–19
  Cole and Marmot’s technology, 18
devices of electrodiagnosis (Duchenne), 10
  “electropuncture,” 10
  EMG (Dubois-Reymond), 11
  EMG specific advances, 19–21
  investigations with galvanometer (Matteucci), 11, 11f
  Julius Bernstein’s rheotome, 13f
  local circuit theory, 13, 16f
  muscular fiber recruitment (Lucas concept), 15–16, 17f
  nerve cell membrane as a permeable capacitor (Bernstein), 14–15, 16f
  nerve conduction, study, 12
See also Dynamic electrodiagnosis;
  Electrodiagnosis and the physical examination; Extending dynamic electrodiagnosis
  Electrodiagnosis and the physical examination it takes two, 26–30
doctor/patient role in physical examination, 26
  EMG, diagnostic tool, 28
evocative maneuvers, 29
  interactive/patient active/clinician active sessions, 27
  interactive physical examination, 27
  limits of physical examination, 27
  provocative maneuvers, 29–30
  symptoms/signs, initial indications for diagnosis, 27
  philosophical reflection of the yet unseen, 31–32
  AANEM, 31
  reference point, benefits to practitioners, 31
  “thesis–antithesis-synthesis,” 31
  physical examination is not just physical clinicians’ analysis about the patient’s suffering, 26
  provocative maneuvers in electrodiagnosis, 30
  relevance to our subject, 24–25
physical examination, advancements in, 25
therapeutical usage of electrical arrangements, 25

Epstein–Barr virus, 43
Erb’s point, 53, 55f, 57, 59f, 71f, 149, 152–153
Extending dynamic electrodiagnosis acting on a hunch
64-year-old with significant lower back pain, case study, 151
driving for a stretch, 154
44-year-old with right buttock while driving car, case study, 154
exclusive considerations
45-year-old with left-sided sciatic pain/foot numbness, case study, 154
functional electromyography, uses of provocative electrophysiological techniques, 145
fusion of electrodiagnosis/physical examination
EMG, 157
functional approach to patient, 158
kinesiology, 156–157
muscular and bony anatomy, 156
peripheral neurology, 157
treatment, 158
ironing with a wrinkle, 152
it’s not all in the wrist!
41-year-old guitar player with right palmar cramping, case study, 153
memos of a snapping scapula, 147–150
resources, 146–147
electromyography, measures recommended, 145
engineer with right Erb’s palsy (case), MRI study, 147, 148f–149f
right to bare arms, 151
44-year old with history of deep gash in left upper arm, case study, 151
surgery
intraoperative functional electrophysiological testing, uses, 158
SSEP, provocative electrodagnostic technique, 158
taking matters to extremes, 152–153
37-year-old with left posterolateral upper arm pain, case study, 152–153, 153t
tools of the trade, 159–161
correlation between independent/dependent variable, 159
establish norms, 160
follow results with functional test, 161
standard deviations, 160
statistical significance vs. clinical significance, 160
treating patients based on pathology, 161
treatment and surgery, improvement of, 161
triple trouble
48-year-old with right lower back pain who developed sciatica, case study, 150
a turn for the worse
34-year-old with bilateral disc herniations after an accident, case study, 155

F
FAIR position, see Flexed, adducted internally rotated (FAIR) position
FAIR test, 30, 40, 44, 75, 88–89, 91–92, 92t, 92f, 99–107, 100t, 102t, 104t–105t, 108f, 109t, 135, 138, 140, 154
FAIR-test positive (FTP), 88, 92, 99, 102, 101t–102t, 106
Filler, A. G., 41–42, 79–80, 80f
Flexed, adducted internally rotated (FAIR) position, 40, 87–92, 90f, 98, 108, 109t, 138, 150
Flexion/extension, extreme and prolonged, 112, 147, 148f

- injection, 67–68
- EMG needle, 68
- patients injected at scalenus anticus and medius muscles, 67, 68f
- physical therapy, 68–69
  - kyphosis, five-stage program for, 68
  - results, 69–70
  - delay (more than 1.0 ms) in Allen’s maneuver, 70t
  - results of scalenus injections and physical therapy, 70–75
  - controls and injected patients, VAS values, 73t
  - delay of PML in Allen test, 71f
  - fractional reduction of PML delay, 71f
  - fractional reduction of PML delay after Bt-B injection, 74t
  - percent of initial pain on VAS/functional delay in the Allen test, 72f
  - reduction in PML and VAS after Bt-B injection, 73f
  - VAS values after Bt-B with controls, 71f
  - scheduled follow-up visits, 69

Treatment of thoracic outlet syndrome based on dynamic changes in nerve conduction, 65–66

Bt-B injections with physical therapy, 66

Treatment of piriformis syndrome
- characteristics of patients with positive FAIR tests, 100–101
- dual diagnosis, effects on treatment, 100
- FAIR test, usefulness in conservative treatment and surgery, 101t
- patients with/without positive MRIs, 100, 100t
- leg study cases, outcome statistics of physical therapy protocol, 98–99, 99t
- treatment, 97–98, 98f
- locating the piriformis muscle, 107–108
- botulinum neurotoxin, no ‘interference pattern,’ 107, 107t

interference pattern attainment, 107
parallel course of pain and delay in FAIR test, 108, 108f
prolongation of H-reflex latency in FAIR position vs. sciatica, 108, 109t
patients identified by functional EMG, 95–97
criteria to define a piriformis syndrome, 95
Stewart’s set, evidence of “diagnosis of exclusion,” 96
pre- and post-surgical FAIR tests, 105, 105t
results, 101–103
concomitants of piriformis syndrome, 103t
FTP patients, response to piriformis injection/physical therapy, 100, 101t
overall utility of the FAIR test, 104t
overuse and trauma, causes of piriformis syndrome, 102t
surgical corroboration of the FAIR test, 103–106
characteristics/outcomes of patients with/without piriformis, 104t
efficacy of surgery, 105
neurolysis of sciatic nerve, 104
study with botulinum neurotoxin, 105–106, 106f

Treatment of spinal stenosis by evoked electromyographic sign asymmetrical on both sides, 141
45-year-old with bilateral sciatica and intermittent lower back pain, case study, 141

Aye, Where’s the Rub?, 132–133
62-year-old with nagging back ache, case study, 132–133
embarrassment of riches, 138–139
53-year-old with left-more-than-right sciatica, case study, 138–139
evocative maneuver, 131–132
39-year-old with left lower back pain and sciatica, case study, 131–132
ex pluribus unum, 141
simple solutions when there were too many diagnoses, 141
fusion and confusion, 131
39-year-old with history of lumbar fusion from L3 to S1, case study, 131
he who hesitates was right, 143–144
if it walks like a duck, 134
53-year-old with left lower back pain and sciatica, case study, 134
illustrative examples, 129
less there than meets the MRI, 139–140
67-year-old with lower back pain, case study, 139–140
less there than meets the MRI, 142
83-year-old with bilaterally circumductive gait, case study, 142
less was probably more, 136–137
87-year-old with thoracolumbar rotatory levoscoliosis, case study, 136–137
long shot
42-year-old with back pain radiating to right lower extremity, case study, 134–135
long-standing problem with sitting, 141–142
41-year-old with left-sided sciatica, case study, 141–142
now you see it, now you don’t, oh there it is again, 140–141
37-year-old with pain in his lower back, left buttock and leg, case study, 140–141
recreational therapy, 133–134
66-year-old with bilateral pseudoocludication, case study, 133–134
small change, 135
61-year-old with spastic cerebral palsy and gait disorder, case study, 135
stenosis or thrombosis, 130–131
72-year-old with right lower back, hip, buttock, and leg pain, case study, 130–131
tale of the horse’s tail, 129–130
60-year-old with prostatic cancer, case study, 129–130
when therapy is not enough, 136
80-year-old with bilateral sciatica that worsened with walking, case study, 136
the woman with everything, 142–143
65-year-old with left buttock pain and mild sciatica, case study, 142–143
