Index

A

Apoptosis

caspase activation...........................................204–208, 212–214, 218, 220–222, 225

cell permeability...........................................204, 205, 208, 209, 216, 219, 224, 228

fluorochrome combination ..................205, 206, 208–211

instruments.......................................................209–211

phosphatidylserine flipping...................... 204, 338, 339, 345–347

simultaneous assays..............................204

B

Biosafety level-3 (BSL-3) cell sorting

infectious sort procedures ..................453, 465

laboratory design

aerosol containment.................................456–457

biological safety cabinet.......................... 451

cell sorter ....................................................453, 455

personal protective equipment

gloves ..................................................413, 418, 467

helmet with shroud.............................453, 466, 467

powered air purifying respirator ............. 451

tolerances and measurement of containment

Glo-Germ particles ....................................... 452

particle collector ......................................... 452

C

Cell cycle analysis

antibodies reactive with cell cycle regulated proteins...........................................233, 234

antibody validation ........................................... 191

cell cycle regulated proteins: cyclin A2, cyclin B1, phospho-S10-histone H3 ..................230, 233, 237, 238, 241, 244

DNA-binding dye (DAPI)......................233–235, 237, 240, 241, 253, 258, 259

mitosis ..................................................120, 233, 242

Cytometry

flow cytometry

data analysis

gating.................................19, 104, 314, 331, 348, 351

histogram...............................15, 18, 19, 62, 106, 126, 127, 186, 328, 376, 379–381, 434, 460

fluidics ......................................... 7–10, 454, 461, 464, 472

historical perspective ........................................... 2

lasers .....................................................5, 12, 13, 204, 222, 472

listmode file .......................................32, 36–42, 44–47, 302

minimalist imaging cytometry

camera chip detector .................................................. 480

charge coupled device (CCD)........................... 451, 453, 454, 477, 478

fluorescence measurement .................. 472, 477, 479, 480

interference filters ........................................... 478

light-emitting diode (LED)............................. 477

microscope lenses ........................................... 478

photodetectors

photodiode ....................................................11, 473

photomultiplier tube (PMT) ..................13, 87, 473

signals

amplification........................................15, 16, 18

analog-to-digital converto (ADC) ............. 15, 18

fluorescent light........................................... 8, 12, 13

scattered light ........................................... 3, 5, 12, 26

sorting

fluorescence-activated cell sorter (FACS) ........... 21

Mack Fulwyler........................................ 21

F

Fluorescence resonance energy transfer (FRET)

choice of fluorophores

acceptor molecule ......................................372, 374, 389

donor molecule .........................................372, 373

custom made evaluation software ................ 376

483
Fluorescence resonance energy transfer (FRET) (Continued)
data analysis
based on donor and acceptor
fluorescence........................................380–382
based on donor quenching...........373, 374, 376,
380, 388
with cell-by-cell autofluorescence
correction........................................383–384
labeling
extracellular epitopes..............................378
intrinsic epitopes.................................378
protein-protein interactions..................371
Fluorescent protein-assisted identification of rare cells
labeling
of melanoma tumor tissues..............399, 401
of rare skin stem cells..................394–395
reporters
green fluorescent protein (GFP).............394, 409,
432, 434
luciferase/GFP (Luc/GFP)......................395
sorting GFP+ cells..................................400
Fluorescent proteins
non-toxic DsRed derivatives: DsRed-Express2,
E2-Orange, E2-Red/Green,
E2-Crimson.................................355–357, 359, 363
screening
for aggregation..................................359
for brightness.....................................361
for cytotoxicity...................................363–365
whole cell labeling
cells........................................365–368
lentiviral vectors..............................367–368
Fluorescent proteins in biotinylation proteomics
biotinylation tagging vector particles
centrifugation..................................436, 439
production......................................436–440
titration........................................436–437, 439–440
cells stably expressing biotin-tagged proteins
FACS purification.........................394, 395, 431, 432
fractionation..................................437, 441
MALDI-TOF mass spectrometry.........437–438,
441–442
streptavidin affinity precipitation.........437–438,
441–442
in vivo biotinylation tagging..............433–435, 444
lentiviral fluorescent protein expression vectors
MSCV-GFP-BirA..........................434, 435
MSCV-TLX1neo-IRE5-YFP..................435
protein-protein interactions...............431, 433, 435, 444

CD4 T-cell antigen-dependent
development......................................39–44
erthroid progression.................................47–48
myeloid progression...............................44–45
GemStone analysis software..................209
probability state modeling....................33–39

Immature myeloid progenitors
anti-mouse antibodies: CD41, CD105,
CD150, cKit, FcgRII/III, ScaI..............279, 291
fluorescence minus one (FMO)...............260, 280,
283, 285–287, 289, 291
internal reference populations..............285, 286
lineage depletion................................282, 283, 290
mouse bone marrow..........................278, 279, 282–283

Immune cell function
cell tracking dyes
membrane dyes: CellVue® Claret,
PKH26, PKH67.................................123
protein dye: CFSE..............................124, 125
cytotoxicity
lymphokine-activated killer
(LAK) cells.................................131, 133, 139
percent cytotoxicity..........................134, 158, 159
target cells...............................131, 133, 134, 137, 138
proliferation
percent suppression..........................147
proliferation fraction...................127, 131, 144–147, 149
proliferative index.........................127, 131, 144–147, 149
T<sub>eff</sub> cells.................................139–148
T<sub>reg</sub> cells.................................139–148

Intracellular cytokine staining
antibody panel design........................167–168
fluorochrome brightness......................167
procedural variables for different functional markers
fixation and permeabilization..............176
secretion inhibitors: brefeldin A,
monensin.................................166, 170, 171, 175, 176
stimulation conditions......................183

Malignancies
hematolymphoid neoplasia
antibody panel design.........................298–301
immunophenotypic characteristics........307
internal controls..............................302
specimens.........................................296

primary immunodeficiency diseases
assays
immunophenotyping.......................320, 322
oxidative burst...............................321, 327–328
quality control..............................326–327, 333
underlying genetic abnormality
functional abnormality...............................319
marker abnormality..................................319
subset abnormality.................................318, 319

Microparticles
flow cytometry
conventional flow cytometer ...............347–349, 352
imaging flow cytometer ...........................349–352
generation of microparticles
from purified cells......................................343–345
from whole blood..................................343–345
labeling of microparticles .........................345–347

Multiplexed analyses
bead-based analysis of analytes
analyte affinity .......................................93–94
analyte quantification...............................92–93
analyte titer .............................................91
bead conjugation ......................................89
capture molecule .....................................89–90, 94, 95
combinatorial antibody profiling
229 directly conjugated antibodies to human cell
surface proteins........................................98
categorization of expression levels ............110–111
high throughput.......................................97–99, 102
R analysis software.................................103

Phospho flow
Cytobank analysis software..................182, 186, 189,
196, 198, 199
fixation and permeabilization .................165, 166,
176, 180
fold change ............................................183, 186, 189,
196, 197
phospho-specific antibodies: p-p38, pStat1, pStat3,
pStat6 ..............................................184, 186, 189, 195–197
sequential staining ..................................180, 183,
191–195, 201
surface marker antibodies .....................180, 181, 185, 195

Quantitative multi-color flow cytometry
antibodies bound per cell (ABC) ...........55, 56, 58, 59, 62
equivalent number of reference fluorophores
(ERF).................................................54–57, 61
fluorescent calibration microspheres
CS & T microspheres ..............................58, 60, 62, 63
quantum dot-labeled microbeads..............72, 77–78
quantum™ FITC MESF beads .................67, 69,
70, 79, 82
Ultra Rainbow microspheres .................56–58, 62, 123
molecules of equivalent soluble fluorophores
(MESF).............................................54, 67–70, 79, 82, 88, 93, 95

Rare event analysis
Anti-human antibodies: CD3, CD14, CD31,
CD33, CD34, CD44, CD45, CD73, CD90,
CD105, CD117, CD133, CD146,
glycophorin A, pan cytokeratin.............253–255
data analysis
classifier parameters...............................263, 269
elimination of sources of interference .......263–269
outcome parameters...............................263, 269
DNA-binding dye (DAPI) .........................272, 279
number of events to acquire .................302

tissue sources: adipose pericytes, bone marrow
mesenchymal cells, pleural fluid...........253–256

Transcriptional profiling of plants expressing fluorescent proteins
microarray hybridization ..........................415, 423–426
RNA extraction and amplification .............415, 423
sorting
nuclei containing targeted GFP ...............418
protoplasts expressing GFP ......................416–418
target labeling: Cy3, Cy5, Leader 423–426
