Subject Index

A
Age, 73–86
Ageing,
Aortic valve replacement, 111, 117, 118, 121
Apoptosis, 44–46, 49, 52

B
Brain stem death, 133, 134, 139

C
Calcium, 180, 181, 183, 191
channel, 200, 201, 208–210, 212
sensitiser, 103, 105
Cardiac surgery, 63–65
Cardioplegia, 15–35, 112, 120–123, 125, 269–279
Cardioprotection, 76, 80–86
Cardiopulmonary bypass, 167–174
Cell transplantation, 222–231, 234–237
Contrast echocardiography, 270
Coronary sinus, 222–228
Cyclooxygenase endothelial derived hyperpolarizing factor, 169, 174

D
Donor heart preservation, 249–262

E
Endothelial dysfunction, 57, 58, 61, 62, 64, 65
Endothelium, 57–65
Excitation-contraction coupling, 200, 201, 208, 213

F
Frailty, 9

G
Gender, 73–86
Gene therapy,

H
Heart failure, 109, 110, 113, 114, 117, 121, 124, 125
Heart transplantation, 131–140
Hypertrophy, 41, 46, 48, 49
Hypothermic perfusion, 253, 255, 257

I
Inflammation, 57, 59–61, 63, 65
Ischemia, 16, 18, 21, 23–29, 31–34, 41–52, 111, 113, 120–123
Ischemia/reperfusion, 74–76, 80, 83, 85

M
Metabolism, 16, 23, 25, 27, 31, 32, 34, 36
Microarray, 86
Mitochondria, 42–44, 46–50
Mitrval valve replacement, 119
30d Mortality, 6
Myocardial infarction, 94
Myocardial protection, 110, 120, 121, 221–242

N
Near-infrared fluorescence imaging, 274, 277
Necrosis, 42, 44, 45, 52
Nitric oxide (NO), 57, 58, 61, 62, 64, 65, 168, 173, 174, 180, 182
direct and indirect donors, 146, 148
homeostasis, 146, 150–152, 154, 156, 159, 160
ischemia/reperfusion, 146, 151, 160
myocardial protection, 159, 160
pathway, 146–148
Normothermic perfusion, 253, 258, 259

O
Organ preservation, 136
Outcome, 5–9
P
Pathophysiology, 94, 95, 99, 110, 111, 125
Perfluorocarbons, 270, 271
Polarized cardiac arrest, 204, 206, 208, 213
Pressure, 252–254, 257–259, 261

R
Reactive oxygen species (ROS), 179–185
Reperfusion, 16, 19, 21, 22, 26, 27, 29–35, 41–44, 47–49, 51
Resuscitation, 23
Retrograde cardioplegia, 222, 224, 225, 239–241
Right ventricle, 93–99
ROS. See Reactive oxygen species

S
Scavengers, 171–192
Sodium and potassium channel, 200–203, 212
Stunning, 75

V
Vascular dysfunction, 167, 170–172
Visualization, 269–279
Dr. Bruno K. Podesser is Associate Professor of Surgery at the Department of Cardiac Surgery at the Landesklinikum St. Pölten, Austria. He is member of the Board of Directors of the Ludwig Boltzmann Cluster for Cardiovascular Research at the Medical University of Vienna, Austria. His research interests include myocardial protection, with particular emphasis on cardioplegic solutions. He has been at the Medical University of Vienna since 1991. In 1996 and 1997 he was working with Professor Carl S. Apstein at Boston University, Boston, USA. His current research interests focus on the preservation of endothelial function as an important aspect of myocardial protection. He enjoys golf and gardening.

Dr. David Chambers is a Consultant Clinical Scientist and Director of Research for Cardiac Surgery at St. Thomas’ Hospital (Guy’s & St. Thomas’ NHS Foundation Trust), London, UK. His research interests include myocardial protection, with particular emphasis on cardioplegic solutions. He has been at St. Thomas’ since 1978, originally working with Mr Mark Brainbridge and Professor David Hearse, on the clinical and experimental development of the St. Thomas’ Hospital cardioplegic solution. His current research interests focus on investigations into alternative cardioplegic solutions that induce a polarised, rather than depolarised, arrest. He enjoys golf and has recently started skiing.
