Appendix A

Fourier Series

A.1 Fourier Coefficients

Let $u$ be a $2T$-periodic function in $\mathbb{R}$ and assume that $u$ can be expanded in a trigonometric series as follows:

$$u(x) = U + \sum_{k=1}^{\infty} \{a_k \cos k\omega x + b_k \sin k\omega x\} \quad (A.1)$$

where $\omega = \pi / T$.

First question: how $u$ and the coefficients $U$, $a_k$ and $b_k$ are related to each other? To answer, we use the following so called orthogonality relations, whose proof is elementary:

$$\int_{-T}^{T} \cos k\omega x \cos m\omega x \, dx = \int_{-T}^{T} \sin k\omega x \sin m\omega x \, dx = 0 \quad \text{if} \ k \neq m$$

$$\int_{-T}^{T} \cos k\omega x \sin m\omega x \, dx = 0 \quad \text{for all} \ k, m \geq 0.$$ 

Moreover

$$\int_{-T}^{T} \cos^2 k\omega x \, dx = \int_{-T}^{T} \sin^2 k\omega x \, dx = T. \quad (A.2)$$

Now, suppose that the series (A.1) converges uniformly in $\mathbb{R}$. Multiplying (A.1) by $\cos n\omega x$ and integrating term by term over $(-T, T)$, the orthogonality relations and (A.2) yield, for $n \geq 1$,

$$\int_{-T}^{T} u(x) \cos n\omega x \, dx = T a_n$$
or
\[a_n = \frac{1}{T} \int_{-T}^{T} u(x) \cos n\omega x \, dx. \tag{A.3}\]

For \(n = 0\) we get
\[\int_{-T}^{T} u(x) \, dx = 2UT\]
or, setting \(U = a_0/2\),
\[a_0 = \frac{1}{T} \int_{-T}^{T} u(x) \, dx \tag{A.4}\]
which is coherent with (A.3) as \(n = 0\). Similarly, we find
\[b_n = \frac{1}{T} \int_{-T}^{T} u(x) \sin n\omega x \, dx. \tag{A.5}\]

Thus, if \(u\) has the uniformly convergent expansion (A.1), the coefficients \(a_n, b_n\) (with \(a_0 = 2U\)) must be given by the formulas (A.3) and (A.5). In this case we say that the trigonometric series
\[\frac{a_0}{2} + \sum_{k=1}^{\infty} \{a_k \cos k\omega x + b_k \sin k\omega x\} \tag{A.6}\]
is the Fourier series of \(u\) and the coefficients (A.3), (A.4) and (A.5) are called the Fourier coefficients of \(u\).

\begin{itemize}
  \item \textit{Odd and even functions.} If \(u\) is an \textit{odd} function, i.e. \(u(-x) = -u(x)\), we have \(a_k = 0\) for every \(k \geq 0\), while
  \[b_k = \frac{2}{T} \int_{0}^{T} u(x) \sin k\omega x \, dx.\]
  Thus, if \(u\) is odd, its Fourier series is a \textit{sine} Fourier series:
  \[u(x) = \sum_{k=1}^{\infty} b_k \sin k\omega x.\]
  Similarly, if \(u\) is \textit{even}, i.e. \(u(-x) = u(x)\), we have \(b_k = 0\) for every \(k \geq 1\), while
  \[a_k = \frac{2}{T} \int_{0}^{T} u(x) \cos k\omega x \, dx.\]
  Thus, if \(u\) is even, its Fourier series is a \textit{cosine} Fourier series:
  \[u(x) = \frac{a_0}{2} + \sum_{k=1}^{\infty} a_k \cos k\omega x.\]
\end{itemize}
• **Fourier coefficients of a derivative.** Let \( u \in C^1(\mathbb{R}) \) be \( 2T \)–periodic. Then we may compute the Fourier coefficients \( a'_k \) and \( b'_k \) of \( u' \). We have, integrating by parts, for \( k \geq 1 \):

\[
a'_k = \frac{1}{T} \int_{-T}^{T} u' (x) \cos k\omega x \, dx
= \frac{1}{T} \left[ u(x) \cos k\omega x \right]_{-T}^{T} + \frac{k\omega}{T} \int_{-T}^{T} u(x) \sin k\omega x \, dx
= \frac{k\omega}{T} \int_{-T}^{T} u(x) \sin k\omega x \, dx = k\omega b_k
\]

and

\[
b'_k = \frac{1}{T} \int_{-T}^{T} u' (x) \sin k\omega x \, dx
= \frac{1}{T} \left[ u(x) \sin k\omega x \right]_{-T}^{T} - \frac{k\omega}{T} \int_{-T}^{T} u(x) \cos k\omega x \, dx
= -\frac{k\omega}{T} \int_{-T}^{T} u(x) \cos k\omega x \, dx = -k\omega a_k.
\]

Thus, the Fourier coefficients \( a'_k \) and \( b'_k \) are related to \( a_k \) and \( b_k \) by the following formulas:

\[
a'_k = k\omega b_k, \quad b'_k = -k\omega a_k. \quad (A.7)
\]

• **Complex form of a Fourier series.** Using the Euler identities

\[e^{\pm ik\omega x} = \cos k\omega x \pm i \sin k\omega x\]

the Fourier series (A.6) can be expressed in the complex form

\[
\sum_{k=-\infty}^{\infty} c_k e^{ik\omega x},
\]

where the complex Fourier coefficients \( c_k \) are given by

\[
c_k = \frac{1}{2T} \int_{-T}^{T} u(z) e^{-ik\omega z} \, dz.
\]

The relations among the real and the complex Fourier coefficients are:

\[
c_0 = \frac{1}{2} a_0
\]
and
\[ c_k = \frac{1}{2} (a_k - b_k), \quad c_{-k} = \bar{c}_k \quad \text{for} \quad k > 0. \]

### A.2 Expansion in Fourier Series

In the above computations we started from a function \( u \) admitting a uniform convergent expansion in Fourier series. Adopting a different point of view, let \( u \) be a \( 2T \)-periodic function and assume we can compute its Fourier coefficients, given by formulas (A.3) and (A.5). Thus, we can associate with \( u \) its Fourier series and write
\[
 u \sim \frac{a_0}{2} + \sum_{k=1}^{\infty} \left\{ a_k \cos k\omega x + b_k \sin k\omega x \right\}.
\]

The main questions are now the following:

1. Which conditions on \( u \) do assure “the convergence” of its Fourier series? Of course there are several notions of convergence (e.g. pointwise, uniform, least squares).

2. If the Fourier series is convergent in some sense, does it always have sum \( u \)?

A complete answer to the above questions is not elementary. The convergence of a Fourier series is a rather delicate matter. We indicate some basic results (for the proofs, see e.g. [36] Rudin, 1976 or [41], Zygmund and Wheeden, 1977.

- **Least squares or \( L^2 \) convergence.** This is perhaps the most natural type of convergence for Fourier series (see Sect. 6.4.2). Let
\[
 S_N(x) = \frac{a_0}{2} + \sum_{k=1}^{N} \{ a_k \cos k\omega x + b_k \sin k\omega x \}
\]
be the \( N \)-partial sum of the Fourier series of \( u \). We have

**Theorem A.1.** Let \( u \) be a square integrable function\(^1\) on \((-T,T)\). Then
\[
 \lim_{N \to +\infty} \int_{-T}^{T} [S_N(x) - u(x)]^2 \, dx = 0.
\]

Moreover, the following Parseval relation holds:
\[
 \frac{1}{T} \int_{-T}^{T} u^2 = \frac{a_0^2}{2} + \sum_{k=1}^{\infty} (a_k^2 + b_k^2). \quad (A.8)
\]

\(^1\) That is \( \int_{-T}^{T} u^2 < \infty \).
Since the numerical series in the right hand side of (A.8) is convergent, we deduce the following important consequence:

**Corollary A.2 (Riemann-Lebesgue).**

\[
\lim_{k \to +\infty} a_k = \lim_{k \to +\infty} b_k = 0
\]

- **Pointwise convergence.** We say that \( u \) satisfies the *Dirichlet conditions* in \([-T, T]\) if it is continuous in \([-T, T]\) except possibly at a finite number of points of jump discontinuity and moreover if the interval \([-T, T]\) can be partitioned in a finite numbers of subintervals such that \( u \) is monotone in each one of them.

  The following theorem holds.

**Theorem A.3.** If \( u \) satisfies the Dirichlet conditions in \([-T, T]\) then the Fourier series of \( u \) converges at each point of \([-T, T]\). Moreover\(^2\):

\[
\frac{a_0}{2} + \sum_{k=1}^{\infty} \{a_k \cos k\omega x + b_k \sin k\omega x\} = \begin{cases} 
\frac{u(x^+) + u(x^-)}{2} & x \in (-T, T) \\
\frac{u(T^-) + u(-T^+)}{2} & x = \pm T
\end{cases}
\]

In particular, under the hypotheses of Theorem A.3, at every point \( x \) of continuity of \( u \), the Fourier series converges to \( u(x) \).

- **Uniform convergence.** A simple criterion of uniform convergence is provided by the Weierstrass test (see Sect.1.4). Since

\[
|a_k \cos k\omega x + b_k \sin k\omega x| \leq |a_k| + |b_k|
\]

we deduce: *If the numerical series*

\[
\sum_{k=1}^{\infty} |a_k| \quad \text{and} \quad \sum_{k=1}^{\infty} |b_k|
\]

*are convergent, then the Fourier series of \( u \) is uniformly convergent in \( \mathbb{R} \), with sum \( u \).*

This is the case, for instance, if \( u \in C^1(\mathbb{R}) \) and is \( 2T \) periodic. In fact, from (A.7) we have for every \( k \geq 1 \),

\[
a_k = -\frac{1}{\omega k} b'_k \quad \text{and} \quad b_k = \frac{1}{\omega k} a'_k.
\]

Therefore

\[
|a_k| \leq \frac{1}{\omega k^2} + (b'_k)^2
\]

\(^2\) We set \( f(x) = \lim_{y \to x} f(y) \).
and

$$|b_k| \leq \frac{1}{\omega k^2} + (a_k')^2.$$  

Now, the series $\sum \frac{1}{k^2}$ is convergent. On the other hand, also the series

$$\sum_{k=1}^{\infty} (a_k')^2 \quad \text{and} \quad \sum_{k=1}^{\infty} (b_k')^2$$

are convergent, by Parseval’s relation (A.8) applied to $u'$ in place of $u$. The conclusion is that if $u \in C^1(\mathbb{R})$ and $2T$ periodic, its Fourier series is uniformly convergent in $\mathbb{R}$ with sum $u$.

Another useful result is a refinement of Theorem A.2.

**Theorem A.4.** Assume $u$ satisfies the Dirichlet conditions in $[-T, T]$. Then:

a) If $u$ is continuous in $[a, b] \subset (-T, T)$, then its Fourier series converges uniformly in $[a, b]$.

b) If $u$ is continuous in $[-T, T]$ and $u(-T) = u(T)$, then its Fourier series converges uniformly in $[-T, T]$ (and therefore in $\mathbb{R}$).
Appendix B

Measures and Integrals

B.1 Lebesgue Measure and Integral

B.1.1 A counting problem

Two persons, that we denote by \( R \) and \( L \), must compute the total value of \( M \) coins, ranging from 1 to 50 cents. \( R \) decides to group the coins arbitrarily in piles of, say, 10 coins each, then to compute the value of each pile and finally to sum all these values. \( L \), instead, decides to partition the coins according to their value, forming piles of 1-cent coins, of 5-cents coins and so on. Then he computes the value of each pile and finally sums all their values.

In more analytical terms, let

\[ V : M \to \mathbb{N} \]

be a value function that associates to each element of \( M \) (i.e. each coin) its value. \( R \) partitions the domain of \( V \) in disjoint subsets, sums the values of \( V \) in such subsets and then sums everything. \( L \) considers each point \( p \) in the image of \( V \) (the value of a single coin), considers the inverse image \( V^{-1}(p) \) (the pile of coins with the same value \( p \)), computes the corresponding value and finally sums over every \( p \).

These two ways of counting correspond to the strategy behind the definitions of the integrals of Riemann and Lebesgue, respectively. Since \( V \) is defined on a discrete set and is integer valued, in both cases there is no problem in summing its values and the choice is determined by an efficiency criterion. Usually, the method of \( L \) is more efficient.

In the case of a real (or complex) function \( f \), the “sums of its values” corresponds to an integration of \( f \). While the construction of \( R \) remains rather elementary, the one of \( L \) requires new tools.

Let us examine the particular case of a bounded and positive function, defined on an interval \([a, b] \subset \mathbb{R}\). Thus, let

\[ f : [a, b] \to [\inf f, \sup f] \]

To construct the Riemann integral, we partition $[a, b]$ in subintervals $I_1, \ldots, I_N$ (the piles of $\mathcal{R}$), then we choose in each interval $I_k$ a point $\xi_k$ and we compute $f(\xi_k) l(I_k)$, where $l(I_k)$ is the length of $I_k$, (i.e. the value of the $k$–th pile). Now we sum the values $f(\xi_k) l(I_k)$ and set

$$(\mathcal{R}) \int_a^b f = \lim_{\delta \to 0} \sum_{k=1}^N f(\xi_k) l(I_k),$$

where $\delta = \max \{l(I_1), \ldots, l(I_N)\}$. If the limit is finite and moreover is independent of the choice of the points $\xi_k$, then this limit defines the Riemann integral of $f$ in $[a, b]$.

Now, let us examine the Lebesgue strategy. This time we partition the interval $[\inf f, \sup f]$ in subintervals $[y_{k-1}, y_k]$ (the values of each coin for $\mathcal{L}$) with $\inf f = y_0 < y_1 < \ldots < y_{N-1} < y_N = \sup f$.

Then we consider the inverse images $E_k = f^{-1}([y_{k-1}, y_k])$ (the piles of homogeneous coins) and we would like to compute their .... length. However, in general $E_k$ is not an interval or a union of intervals and, in principle, it could be a very irregular set so that it is not clear what is the “length” of $E_k$.

Thus, the need arises to associate with every $E_k$ a measure, which replaces the length when $E_k$ is an irregular set. This leads to the introduction of the Lebesgue measure of (practically every) set $E \subseteq \mathbb{R}$, denoted by $|E|$.

Once we know how to measure $E_k$ (the number of coins in the $k$–th pile), we choose an arbitrary point $\overline{\alpha}_k \in [y_{k-1}, y_k]$ and we compute $\overline{\alpha}_k |E_k|$ (the value of the $k$–th pile). Then, we sum all the values $\overline{\alpha}_k |E_k|$ and set

$$(\mathcal{L}) \int_a^b f = \lim_{\rho \to 0} \sum_{k=1}^N \overline{\alpha}_k |E_k|$$

where $\rho$ is the maximum among the lengths of the intervals $[y_{k-1}, y_k]$. It can be seen that under our hypotheses, the limit exists, is finite and is independent of the choice of $\overline{\alpha}_k$. Thus, we may always choose $\overline{\alpha}_k = y_{k-1}$. This remark leads to the definition of the Lebesgue integral in Sect. B.3: the number $\sum_{k=1}^N y_{k-1} |E_k|$ is nothing else that the integral of a simple function, which approximates $f$ from below and whose range is the finite set $y_0 < \ldots < y_{N-1}$. The integral of $f$ is the supremum of these numbers.

The resulting theory has several advantages with respect to that of Riemann. For instance, the class of integrable functions is much wider and there is no need to distinguish among bounded or unbounded functions or integration domains.

Especially important are the convergence theorems presented in Sect. B.1.4, which allow the possibility of interchanging the operation of limit and integration, under rather mild conditions.
Finally, the construction of the Lebesgue measure and integral can be greatly
generalized as we will mention in Sect. B.1.5.

For the proofs of the theorems stated in this Appendix, the interested reader
can consult, e.g. [36], Rudin, 1976, or [41], Zygmund and Wheeden, 1977.

**B.1.2 Measures and measurable functions**

A measure in a set $\Omega$ is a *set function*, defined on a particular class of subsets of $\Omega$ called *measurable set* which “behaves well” with respect to union, intersection and complementation. Precisely:

**Definition B.1.** A collection $\mathcal{F}$ of subsets of $\Omega$ is called $\sigma$-algebra if:

1. $\emptyset, \Omega \in \mathcal{F}$.
2. $A \in \mathcal{F}$ implies $\Omega \setminus A \in \mathcal{F}$.
3. If $\{A_k\}_{k \in \mathbb{N}} \subset \mathcal{F}$ then also $\bigcup_{k \geq 1} A_k$ and $\bigcap_{k \geq 1} A_k$ belong to $\mathcal{F}$.

**Example B.2.** If $\Omega = \mathbb{R}^n$, we can define the smallest $\sigma$-algebra containing all the open subsets of $\mathbb{R}^n$, called the Borel $\sigma$-algebra. Its elements are called *Borel sets*, typically obtained by countable unions and/or intersections of open sets.

**Definition B.3.** Given a $\sigma$-algebra $\mathcal{F}$ in a set $\Omega$, a measure on $\mathcal{F}$ is a function $\mu : \mathcal{F} \to \mathbb{R}$ such that:

1. $\mu(A) \geq 0$ for every $A \in \mathcal{F}$.
2. If $A_1, A_2, \ldots$ are pairwise disjoint sets in $\mathcal{F}$, then
   \[ \mu \left( \bigcup_{k \geq 1} A_k \right) = \sum_{k \geq 1} \mu(A_k) \]  
   ($\sigma$-additivity).

The elements of $\mathcal{F}$ are called measurable sets.

The Lebesgue measure in $\mathbb{R}^n$ is defined on a $\sigma$-algebra $\mathcal{M}$ containing the Borel $\sigma$-algebra, through the following theorem.

**Theorem B.4.** There exists in $\mathbb{R}^n$ a $\sigma$-algebra $\mathcal{M}$ and a measure $|\cdot|_n : \mathcal{M} \to [0, +\infty]$ with the following properties:

1. Each open and closed set belongs to $\mathcal{M}$.
2. If $A \in \mathcal{M}$ and $A$ has measure zero, every subset of $A$ belongs to $\mathcal{M}$ and has measure zero.
3. If $A = \{x \in \mathbb{R}^n : a_j < x_j < b_j; \ j = 1, \ldots, n\}$ then $|A| = \prod_{j=1}^{n} (b_j - a_j)$.
The elements of $\mathcal{M}$ are called *Lebesgue measurable sets* and $|\cdot|_n$ (or simply $|$ if no confusion arises) is called the *$n$-dimensional Lebesgue measure*. Unless explicitly said, from now on, *measurable* means *Lebesgue measurable* and the measure is the Lebesgue measure.

Not every subset of $\mathbb{R}^n$ is measurable. However, the nonmeasurable ones are quite ... pathological! The sets of measure zero are quite important. Here are some examples: all countable sets, e.g. the set $\mathbb{Q}$ of rational numbers; straight lines or smooth curves in $\mathbb{R}^2$; straight lines, hyperplanes, smooth curves and surfaces in $\mathbb{R}^3$.

Notice that a straight line segment has measure zero in $\mathbb{R}^2$ but, of course not in $\mathbb{R}$.

We say that a *property holds almost everywhere in $A \in \mathcal{M}$* (in short, a.e. in $A$) *if it holds at every point of $A$ except that in a subset of measure zero*.

For instance, the sequence $f_k(x) = \exp(-n \sin^2 x)$ converges to zero a.e. in $\mathbb{R}$, a Lipschitz function is differentiable a.e. in its domain (Rademacher’s Theorem 1.3, p. 14).

The Lebesgue integral is defined for *measurable* functions, characterized by the fact that the inverse image of every closed set is measurable.

**Definition B.5.** Let $A \subseteq \mathbb{R}^n$ be measurable, and $f : A \to \mathbb{R}$. We say that $f$ is measurable if

$$f^{-1}(C) \in \mathcal{F}$$

for any closed set $C \subseteq \mathbb{R}$.

If $f$ is continuous, is measurable. The sum and the product of a finite number of measurable functions is measurable. The pointwise limit of a sequence of measurable functions is measurable.

If $f : A \to \mathbb{R}$, is measurable, we define its *essential supremum* or *least upper bound* by the formula:

$$\text{ess sup } f = \inf \{K : f \leq K \text{ a.e. in } A\}.$$  

Note that, if $f = \chi_{\mathbb{Q}}$, the characteristic functions of the rational numbers, we have $\sup f = 1$, but $\text{ess sup } f = 0$, since $|\mathbb{Q}| = 0$.

Every measurable function may be approximated by *simple functions*. A function $s : A \subseteq \mathbb{R}^n \to \mathbb{R}$ is said to be *simple* if its range is constituted by a *finite number* of values $s_1, \ldots, s_N$, attained respectively on measurable sets $A_1, \ldots, A_N$, contained in $A$. Introducing the characteristic functions $\chi_{A_j}$, we may write

$$s = \sum_{j=1}^{N} s_j \chi_{A_j}.$$  

---

1 See e.g. [36], *Rudin, 1976*. 
We have:

**Theorem B.6.** Let $f : A \to \mathbb{R}$, be measurable. There exists a sequence $\{s_k\}$ of simple functions converging pointwise to $f$ in $A$. Moreover, if $f \geq 0$, we may choose $\{s_k\}$ increasing.

### B.1.3 The Lebesgue integral

We define the Lebesgue integral of a measurable function on a measurable set $A$. For a simple function

$$s = \sum_{j=1}^{N} s_j \chi_{A_j}$$

we set:

$$\int_A s = \sum_{j=1}^{N} s_j |A_j|,$$

with the agreement that, if $s_j = 0$ and $|A_j| = +\infty$, then $s_j |A_j| = 0$.

If $f \geq 0$ is measurable, we define

$$\int_A f = \sup \int_A s,$$

where the supremum is computed over the set of all simple functions $s$ such that $s \leq f$ in $A$.

In general, if $f$ is measurable, we write $f = f^+ - f^-$, where $f^+ = \max \{f, 0\}$ and $f^- = \max \{-f, 0\}$ are the positive and negative parts of $f$, respectively. Then we set:

$$\int_A f = \int_A f^+ - \int_A f^-,$$

under the condition that at least one of the two integrals in the right hand side is finite.

If both these integrals are finite, the function $f$ is said to be **integrable** or **summable** in $A$. From the definition, it follows immediately that a measurable functions $f$ is integrable in $A$ if and only if $|f|$ is integrable in $A$.

All the functions Riemann integrable in a set $A$ are Lebesgue integrable as well. An interesting example of non Lebesgue integrable function in $(0, +\infty)$ is given by $h(x) = \sin x / x$. In fact\(^2\)

$$\int_0^{+\infty} \frac{|\sin x|}{x} \, dx = +\infty.$$

\(^2\) We may write

$$\int_0^{+\infty} |\sin x| \, dx = \sum_{k=1}^{\infty} \int_{(k-1)\pi}^{k\pi} \frac{|\sin x|}{x} \, dx \geq \sum_{k=1}^{\infty} \frac{1}{k\pi} \int_{(k-1)\pi}^{k\pi} |\sin x| \, dx = \sum_{k=1}^{\infty} \frac{2}{k\pi} = +\infty.$$
On the contrary, it may be proved that
\[
\lim_{N \to +\infty} \int_0^N \frac{\sin x}{x} \, dx = \frac{\pi}{2}
\]
and therefore the improper Riemann integral of \( h \) is finite.

The set of the integrable functions in \( A \) is denoted by \( L^1(A) \). If we identify two functions when they agree a.e. in \( A \), \( L^1(A) \) becomes a Banach space with the norm\(^3\)
\[
\| f \|_{L^1(A)} = \int_A |f|.
\]
We denote by \( L^1_{\text{loc}}(A) \) the set of \textit{locally summable functions}, i.e. of the functions which are summable in every compact subset of \( A \).

### B.1.4 Some fundamental theorems

The following theorems are among the most important and useful in the theory of integration.

**Theorem B.7 (Dominated Convergence Theorem).** Let \( \{ f_k \} \) be a sequence of summable functions in \( A \) such that \( f_k \to f \) a.e. in \( A \). If there exists \( g \geq 0 \), summable in \( A \) and such that \( |f_k| \leq g \) a.e. in \( A \), then \( f \) is summable and
\[
\| f_k - f \|_{L^1(A)} \to 0 \quad \text{as} \quad k \to +\infty.
\]
In particular
\[
\lim_{k \to \infty} \int_A f_k = \int_A f.
\]

**Theorem B.8.** Let \( \{ f_k \} \) be a sequence of summable functions in \( A \) such that
\[
\| f_k - f \|_{L^1(A)} \to 0 \quad \text{as} \quad k \to +\infty.
\]
Then there exists a subsequence \( \{ f_{k_j} \} \) such that \( f_{k_j} \to f \) a.e. as \( j \to +\infty \).

**Theorem B.9 (Monotone Convergence Theorem).** Let \( \{ f_k \} \) be a sequence of nonnegative, measurable functions in \( A \) such that
\[
f_1 \leq f_2 \leq \ldots \leq f_k \leq f_{k+1} \leq \ldots .
\]
Then
\[
\lim_{k \to \infty} \int_A f_k = \int_A \lim_{k \to \infty} f_k.
\]

\(^3\) See Chap. 6.
Example B.10. A typical situation we often encounter in this book is the following. Let $f \in L^1(A)$ and, for $\varepsilon > 0$, set $A_\varepsilon = \{|f| > \varepsilon\}$. Then, we have

$$\int_{A_\varepsilon} f \to \int_A f \quad \text{as } \varepsilon \to 0.$$ 

This follows from Theorem B.7 since, for every sequence $\varepsilon_j \to 0$, we have $|f| \chi_{A_{\varepsilon_j}} \leq |f|$ and therefore

$$\int_{A_{\varepsilon_j}} f = \int_A f \chi_{A_{\varepsilon_j}} \to \int_A f \quad \text{as } \varepsilon \to 0.$$ 

Let $C_0(A)$ be the set of continuous functions in $A$, compactly supported in $A$. An important fact is that any summable function may be approximated by a function in $C_0(A)$.

Theorem B.11. Let $f \in L^1(A)$. Then, for every $\delta > 0$, there exists a continuous function $g \in C_0(A)$ such that

$$\|f - g\|_{L^1(A)} < \delta.$$ 

The fundamental theorem of calculus extends to the Lebesgue integral in the following form:

Theorem B.12 (Differentiation). Let $f \in L^1_{loc}(\mathbb{R})$. Then

$$\frac{d}{dx} \int_a^x f(t) \, dt = f(x) \quad \text{a.e. } x \in \mathbb{R}.$$ 

Finally, the integral of a summable function can be computed via iterated integrals in any order. Precisely, let

$$I_1 = \{x \in \mathbb{R}^n : -\infty \leq a_i < x_i < b_i \leq \infty; \ i = 1, \ldots, n\}$$

and

$$I_2 = \{y \in \mathbb{R}^m : -\infty \leq a_j < y_j < b_j \leq \infty; \ j = 1, \ldots, m\}.$$ 

Theorem B.13 (Fubini). Let $f$ be summable in $I = I_1 \times I_2 \subset \mathbb{R}^n \times \mathbb{R}^m$. Then

1. $f(x, \cdot) \in L^1(I_2)$ for a.e. $x \in I_1$, and $f(\cdot, y) \in L^1(I_1)$ for a.e. $y \in I_2$.
2. $\int_{I_2} f(\cdot, y) \, dy \in L^1(I_1)$ and $\int_{I_1} f(x, \cdot) \, dx \in L^1(I_2)$.
3. The following formulas hold:

$$\int_I f(x, y) \, dx \, dy = \int_{I_1} dx \int_{I_2} f(x, y) \, dy = \int_{I_2} dy \int_{I_1} f(x, y) \, dx.$$
B.1.5 Probability spaces, random variables and their integrals

Let $\mathcal{F}$ be a $\sigma$-algebra in a set $\Omega$. A probability measure $P$ on $\mathcal{F}$ is a measure in the sense of definition B.2, such that $P(\Omega) = 1$ and

$$P : \mathcal{F} \to [0, 1].$$

The triplet $(\Omega, \mathcal{F}, P)$ is called a probability space. In this setting, the elements $\omega$ of $\Omega$ are sample points, while a set $A \in \mathcal{F}$ has to be interpreted as an event. $P(A)$ is the probability of (occurrence of) $A$.

A typical example is given by the triplet

$$\Omega = [0, 1], \mathcal{F} = \mathcal{M} \cap [0, 1], P(A) = |A|$$

which models a uniform random choice of a point in $[0, 1]$.

A 1-dimensional random variable in $(\Omega, \mathcal{F}, P)$ is a function

$$X : \Omega \to \mathbb{R}$$

such that $X$ is $\mathcal{F}$-measurable, that is

$$X^{-1}(C) \in \mathcal{F}$$

for each closed set $C \subseteq \mathbb{R}$.

Example B.14. The number $k$ of steps to the right after $N$ steps in the random walk of Sect. 2.4 is a random variable. Here $\Omega$ is the set of walks of $N$ steps.

By the same procedure used to define the Lebesgue integral we can define the integral of a random variable with respect to a probability measure. We sketch the main steps.

If $X$ is simple, i.e. $X = \sum_{j=1}^{N} s_j \chi_{A_j}$, we define

$$\int_{\Omega} X \, dP = \sum_{j=1}^{N} s_j P(A_j).$$

If $X \geq 0$ we set

$$\int_{\Omega} X \, dP = \sup \left\{ \int_{\Omega} Y \, dP : Y \leq X, Y \text{ simple} \right\}.$$

Finally, if $X = X^+ - X^-$ we define

$$\int_{\Omega} X \, dP = \int_{\Omega} X^+ \, dP - \int_{\Omega} X^- \, dP$$

provided at least one of the integral on the right hand side is finite.
In particular, if
\[ \int_\Omega |X| \, dP < \infty, \]
then
\[ E(X) = \langle X \rangle = \int_\Omega X \, dP \]
is called the expected value (or mean value or expectation) of \( X \), while
\[ \text{Var}(X) = \int_\Omega (X - E(X))^2 \, dP \]
is called the variance of \( X \).

Analogous definitions can be given componentwise for \( n \)-dimensional random variables
\[ \mathbf{X} : \Omega \rightarrow \mathbb{R}^n. \]
Appendix C

Identities and Formulas

C.1 Gradient, Divergence, Curl, Laplacian

Let $F$ be a smooth vector field and $f$ a smooth real function, in $\mathbb{R}^3$.

Orthogonal cartesian coordinates

1. gradient:
   \[ \nabla f = \frac{\partial f}{\partial x} \mathbf{i} + \frac{\partial f}{\partial y} \mathbf{j} + \frac{\partial f}{\partial z} \mathbf{k}. \]

2. divergence ($F = F_1 \mathbf{i} + F_2 \mathbf{j} + F_3 \mathbf{k}$):
   \[ \text{div } F = \frac{\partial}{\partial x} F_1 + \frac{\partial}{\partial y} F_2 + \frac{\partial}{\partial z} F_3. \]

3. Laplacian:
   \[ \Delta f = \frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2} + \frac{\partial^2 f}{\partial z^2}. \]

4. curl:
   \[ \text{curl } F = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ F_1 & F_2 & F_3 \end{vmatrix}. \]

Cylindrical coordinates

\[ x = r \cos \theta, \quad y = r \sin \theta, \quad z = z \quad (r > 0, \quad 0 \leq \theta \leq 2\pi) \]
\[ \mathbf{e}_r = \cos \theta \mathbf{i} + \sin \theta \mathbf{j}, \quad \mathbf{e}_\theta = -\sin \theta \mathbf{i} + \cos \theta \mathbf{j}, \quad \mathbf{e}_z = \mathbf{k}. \]

1. gradient:
   \[ \nabla f = \frac{\partial f}{\partial r} \mathbf{e}_r + \frac{1}{r} \frac{\partial f}{\partial \theta} \mathbf{e}_\theta + \frac{\partial f}{\partial z} \mathbf{e}_z. \]
2. **divergence** \( \mathbf{F} = F_r \mathbf{e}_r + F_\theta \mathbf{e}_\theta + F_z \mathbf{k} \):

\[
\text{div} \mathbf{F} = \frac{1}{r} \frac{\partial}{\partial r} \left( rF_r \right) + \frac{1}{r} \frac{\partial}{\partial \theta} F_\theta + \frac{\partial}{\partial z} F_z .
\]

3. **Laplacian**:

\[
\Delta f = \frac{1}{r} \frac{\partial}{\partial r} \left( r \frac{\partial f}{\partial r} \right) + \frac{1}{r^2} \frac{\partial^2 f}{\partial \theta^2} + \frac{\partial^2 f}{\partial z^2} = \frac{\partial^2 f}{\partial r^2} + \frac{1}{r} \frac{\partial f}{\partial r} + \frac{1}{r^2} \frac{\partial^2 f}{\partial \theta^2} + \frac{\partial^2 f}{\partial z^2} .
\]

4. **curl**:

\[
\text{curl} \mathbf{F} = \frac{1}{r} \left| \begin{array}{ccc} \mathbf{e}_r & r \mathbf{e}_\theta & \mathbf{e}_z \\ \partial_r & \partial_\theta & \partial_z \\ F_r & r F_\theta & F_z \end{array} \right| .
\]

**Spherical coordinates**

\[
x = r \cos \theta \sin \psi, \quad y = r \sin \theta \sin \psi, \quad z = r \cos \psi \quad (r > 0, \ 0 \leq \theta \leq 2\pi, \ 0 \leq \psi \leq \pi)
\]

\[
\mathbf{e}_r = \cos \theta \sin \psi \mathbf{i} + \sin \theta \sin \psi \mathbf{j} + \cos \psi \mathbf{k}
\]

\[
\mathbf{e}_\theta = -\sin \theta \mathbf{i} + \cos \theta \mathbf{j}
\]

\[
\mathbf{e}_\psi = \cos \theta \cos \psi \mathbf{i} + \sin \theta \cos \psi \mathbf{j} - \sin \psi \mathbf{k}.
\]

1. **gradient**:

\[
\nabla f = \frac{\partial f}{\partial r} \mathbf{e}_r + \frac{1}{r \sin \psi} \frac{\partial f}{\partial \theta} \mathbf{e}_\theta + \frac{1}{r \sin \psi} \frac{\partial f}{\partial \psi} \mathbf{e}_\psi .
\]

2. **divergence** \( \mathbf{F} = F_r \mathbf{e}_r + F_\theta \mathbf{e}_\theta + F_\psi \mathbf{e}_\psi \):

\[
\text{div} \mathbf{F} = \frac{\partial}{\partial r} F_r + \frac{2}{r} F_r + \frac{1}{r} \left[ \frac{1}{\sin \psi} \frac{\partial}{\partial \theta} F_\theta + \frac{\partial}{\partial \psi} F_\psi + \cot \psi F_\psi \right] .
\]

3. **Laplacian**:

\[
\Delta f = \frac{\partial^2 f}{\partial r^2} + \frac{2}{r} \frac{\partial f}{\partial r} + \frac{1}{r^2} \left\{ \frac{1}{(\sin \psi)^2} \frac{\partial^2 f}{\partial \theta^2} + \frac{\partial^2 f}{\partial \psi^2} + \cot \psi \frac{\partial f}{\partial \psi} \right\} .
\]

4. **curl**:

\[
\text{rot} \mathbf{F} = \frac{1}{r^2 \sin \psi} \left| \begin{array}{ccc} \mathbf{e}_r & r \mathbf{e}_\psi & r \sin \psi \mathbf{e}_\theta \\ \partial_r & \partial_\psi & \partial_\theta \\ F_r & r F_\psi & r \sin \psi F_z \end{array} \right| .
\]
C.2 Formulas

Gauss’ formulas

In $\mathbb{R}^n$, $n \geq 2$, let:

- $\Omega$ be a bounded smooth domain and and $\nu$ the outward unit normal on $\partial \Omega$.
- $u, v$ be vector fields of class $C^1(\bar{\Omega})$.
- $\varphi, \psi$ be real functions of class $C^1(\bar{\Omega})$.
- $d\sigma$ be the area element on $\partial \Omega$.

1. $\int_{\Omega} \text{div } u\, dx = \int_{\partial \Omega} u \cdot \nu \, d\sigma$ (Divergence Theorem).
2. $\int_{\Omega} \nabla \varphi \, dx = \int_{\partial \Omega} \varphi \nu \, d\sigma$.
3. $\int_{\Omega} \Delta \varphi \, dx = \int_{\partial \Omega} \nabla \varphi \cdot \nu \, d\sigma = \int_{\partial \Omega} \partial_{\nu \varphi} \, d\sigma$.
4. $\int_{\Omega} \psi \text{ div } F \, dx = \int_{\partial \Omega} \psi \nu \cdot F \, d\sigma - \int_{\Omega} \nabla \psi \cdot F \, dx$ (Integration by parts).
5. $\int_{\Omega} \psi \Delta \varphi \, dx = \int_{\partial \Omega} \psi \partial_{\nu \varphi} \, d\sigma - \int_{\Omega} \nabla \varphi \cdot \nabla \psi \, dx$ (Green’s identity I).
6. $\int_{\Omega} (\psi \Delta \varphi - \varphi \Delta \psi) \, dx = \int_{\partial \Omega} (\psi \partial_{\nu \varphi} - \varphi \partial_{\nu \psi}) \, d\sigma$ (Green’s identity II).
7. $\int_{\Omega} \text{curl } u \, dx = -\int_{\partial \Omega} u \times \nu \, d\sigma$.
8. $\int_{\Omega} u \cdot \text{curl } v \, dx = \int_{\Omega} v \cdot \text{curl } u \, dx - \int_{\partial \Omega} (u \times v) \cdot \nu \, d\sigma$.

Identities

1. $\text{div } \text{curl } u = 0$.
2. $\text{curl } \nabla \varphi = 0$.
3. $\text{div } (\varphi u) = \varphi \text{ div } u + \nabla \varphi \cdot u$.
4. $\text{curl } (\varphi u) = \varphi \text{ curl } u + \nabla \varphi \times u$.
5. $\text{curl } (u \times v) = (v \cdot \nabla) u - (u \cdot \nabla) v + (\text{div } v) u - (\text{div } u) v$.
6. $\text{div } (u \times v) = \text{curl u} \cdot v - \text{curl v} \cdot u$.
7. $\nabla (u \cdot v) = u \times \text{curl } v + v \times \text{curl } u + (u \cdot \nabla) v + (v \cdot \nabla) u$.
8. $(u \cdot \nabla) u = \text{curl u} \times u + \frac{1}{2} \nabla |u|^2$.
9. $\text{curl curl } u = \nabla (\text{div } u) - \Delta u$.

Value function, 88
Variational formulation
– Dirichlet problem, 508, 521
– Mixed problem, 514, 528
– Neumann problem, 511, 526
– Robin problem, 513
Variational inequality
– on closed convex sets, 422
Variational principle
– for the first eigenvalue, 412
– for the k-th eigenvalue, 413
Volatility, 89

W
– rarefaction, p-system, 648, 649
Wave
– capillarity, 334
– cylindrical, 294
– gravity, 334
– harmonic, 257
– incoming/outgoing, 296
– linear, 326
– linear gravity, 343
– monochromatic/harmonic, 294
– number, 258
– packet, 260
– plane, 259, 294
– shock, 642
– shock, p-system, 647, 648
– simple, 635
– spherical, 295
– standing, 258
– travelling, 257
Weak coerciveness, 523
Weak formulation
– Cauchy-Dirichlet problem, 582
– Cauchy-Robin/Neumann problem, 592–594
– Initial-Dirichlet problem (wave eq.), 606
Weakly coercive
– bilinear form, 594
– form, 399
Weierstrass test, 11, 29

Young modulus, 340
As of 2004, the books published in the series have been given a volume number. Titles in grey indicate editions out of print. As of 2011, the series also publishes books in English.

A. Bernasconi, B. Codenotti
Introduzione alla complessità computazionale

A. Bernasconi, B. Codenotti, G. Resta
Metodi matematici in complessità computazionale

E. Salinelli, F. Tomarelli
Modelli dinamici discreti

S. Bosch
Algebra

S. Graffi, M. Degli Esposti
Fisica matematica discreta

S. Margarita, E. Salinelli
MultiMath – Matematica Multimediale per l’Università
A. Quarteroni, R. Sacco, F. Saleri  
Matematica numerica (2a Ed.)  
2002, 2004 ristampa riveduta e corretta  

13. A. Quarteroni, F. Saleri  
Introduzione al Calcolo Scientifico (2a Ed.)  

14. S. Salsa  
Equazioni a derivate parziali - Metodi, modelli e applicazioni  

15. G. Riccardi  
Calcolo differenziale ed integrale  

16. M. Impedovo  
Matematica generale con il calcolatore  

17. L. Formaggia, F. Saleri, A. Veneziani  
Applicazioni ed esercizi di modellistica numerica per problemi differenziali  

18. S. Salsa, G. Verzini  
Equazioni a derivate parziali – Complementi ed esercizi  
2007, ristampa con modifiche

19. C. Canuto, A. Tabacco  
Analisi Matematica I (2a Ed.)  

20. F. Biagini, M. Campanino  
Elementi di Probabilità e Statistica  
21. S. Leonesi, C. Toffalori
   Numeri e Crittografia

22. A. Quarteroni, F. Saleri
   Introduzione al Calcolo Scientifico (3a Ed.)

23. S. Leonesi, C. Toffalori
   Un invito all'Algebra

24. W.M. Baldoni, C. Ciliberto, G.M. Piacentini Cattaneo
   Aritmetica, Crittografia e Codici

25. A. Quarteroni
   Modellistica numerica per problemi differenziali (3a Ed.)
   (1a edizione 2000, ISBN 88-470-0108-0)

26. M. Abate, F. Tovena
   Curve e superfici

27. L. Giuzzi
   Codici correttori

28. L. Robbiano
   Algebra lineare

29. E. Rosazza Gianin, C. Sgarra
   Esercizi di finanza matematica

30. A. Machì
   Gruppi – Una introduzione a idee e metodi della Teoria dei Gruppi
   2010, ristampa con modifiche
31. Y. Biollay, A. Chaabouni, J. Stubbe  
   Matematica si parte!  
   A cura di A. Quarteroni  

32. M. Manetti  
   Topologia  

33. A. Pascucci  
   Calcolo stocastico per la finanza  

34. A. Quarteroni, R. Sacco, F. Saleri  
   Matematica numerica (3a Ed.)  

35. P. Cannarsa, T. D'Aprile  
   Introduzione alla teoria della misura e all'analisi funzionale  

36. A. Quarteroni, F. Saleri  
   Calcolo scientifico (4a Ed.)  

37. C. Canuto, A. Tabacco  
   Analisi Matematica I (3a Ed.)  

38. S. Gabelli  
   Teoria delle Equazioni e Teoria di Galois  

39. A. Quarteroni  
   Modellistica numerica per problemi differenziali (4a Ed.)  

40. C. Canuto, A. Tabacco  
   Analisi Matematica II  
   2010, ristampa con modifiche

41. E. Salinelli, F. Tomarelli  
   Modelli Dinamici Discreti (2a Ed.)  
42. S. Salsa, F.M.G. Vegni, A. Zaretti, P. Zunino
   Invito alle equazioni a derivate parziali

43. S. Dulli, S. Furini, E. Peron
   Data mining

44. A. Pascucci, W.J. Runggaldier
   Finanza Matematica

45. S. Salsa
   Equazioni a derivate parziali – Metodi, modelli e applicazioni (2a Ed.)

46. C. D’Angelo, A. Quarteroni
   Matematica Numerica – Esercizi, Laboratori e Progetti

47. V. Moretti
   Teoria Spettrale e Meccanica Quantistica – Operatori in spazi di Hilbert

48. C. Parenti, A. Parmeggiani
   Algebra lineare ed equazioni differenziali ordinarie

49. B. Korte, J. Vygen
   Ottimizzazione Combinatoria. Teoria e Algoritmi

50. D. Mundici
   Logica: Metodo Breve

51. E. Fortuna, R. Frigerio, R. Pardini
   Geometria proiettiva. Problemi risolti e richiami di teoria

52. C. Presilla
   Elementi di Analisi Complessa. Funzioni di una variabile
53. L. Grippo, M. Sciandrone  
   Metodi di ottimizzazione non vincolata  

54. M. Abate, F. Tovena  
   Geometria Differenziale  

55. M. Abate, F. Tovena  
   Curves and Surfaces  

56. A. Ambrosetti  
   Appunti sulle equazioni differenziali ordinarie  

57. L. Formaggia, F. Saleri, A. Veneziani  
   Solving Numerical PDEs: Problems, Applications, Exercises  

58. A. Machi  
   Groups. An Introduction to Ideas and Methods of the Theory of Groups  

59. A. Pascucci, WJ. Runggaldier  

60. D. Mundici  
   Logic: a Brief Course  

61. A. Machi  
   Algebra for Symbolic Computation  

62. A. Quarteroni, F. Saleri, P. Gervasio  
   Calcolo Scientifico (5a ed.)  

63. A. Quarteroni  
   Modellistica Numerica per Problemi Differenziali (5a ed.)  
64. V. Moretti  
Spectral Theory and Quantum Mechanics  
With an Introduction to the Algebraic Formulation  

65. S. Salsa, F.M.G. Vegni, A. Zaretti, P. Zunino  
A Primer on PDEs. Models, Methods, Simulations  

66. V.I. Arnold  
Real Algebraic Geometry  

67. F. Caravenna, P. Dai Pra  
Probabilità. Un'introduzione attraverso modelli e applicazioni  

68. A. de Luca, F. D'Alessandro  
Teoria degli Automi Finiti  

69. P. Biscari, T. Ruggeri, G. Saccomandi, M. Vianello  
Meccanica Razionale  

70. E. Rosazza Gianin, C. Sgarra  
Mathematical Finance: Theory Review and Exercises. From Binomial Model to Risk Measures  
2013, X+278pp, ISBN 978-3-319-01356-5

71. E. Salinelli, F. Tomarelli  
Modelli Dinamici Discreti (3a Ed.)  

72. C. Presilla  
Elementi di Analisi Complessa. Funzioni di una variabile (2a Ed.)  

73. S. Ahmad, A. Ambrosetti  
A Textbook on Ordinary Differential Equations  
74. A. Bermúdez, D. Gómez, P. Salgado
   Mathematical Models and Numerical Simulation in Electromagnetism
   2014, XVIII+430pp, ISBN 978-3-319-02948-1

75. A. Quarteroni
   Matematica Numerica. Esercizi, Laboratori e Progetti (2a Ed.)

76. E. Salinelli, F. Tomarelli
   Discrete Dynamical Models
   2014, XVI+386pp, ISBN 978-3-319-02290-1

77. A. Quarteroni, R. Sacco, F. Saleri, P. Gervasio
   Matematica Numerica (4a Ed.)

78. M. Manetti
   Topologia (2a Ed.)

79. M. Iannelli, A. Pugliese
   An Introduction to Mathematical Population Dynamics.
   Along the trail of Volterra and Lotka
   2014, XIV+338pp, ISBN 978-3-319-03025-8

80. V.M. Abrusci, L. Tortora de Falco
    Logica. Volume 1

81. P. Biscari, T. Ruggeri, G. Saccomandi, M. Vianello
    Meccanica Razionale (2a Ed.)

82. C. Canuto, A. Tabacco
    Analisi Matematica I (4a Ed.)

83. C. Canuto, A. Tabacco
    Analisi Matematica II (2a Ed.)

84. C. Canuto, A. Tabacco
    Mathematical Analysis I (2nd Ed.)
    2015, XIV+484pp, ISBN 978-3-319-12771-2
85. C. Canuto, A. Tabacco  
   Mathematical Analysis II (2nd Ed.)  
   2015, XII+550pp, ISBN 978-3-319-12756-9

86. S. Salsa  
   Partial Differential Equations in Action. From Modelling to Theory (2nd Ed.)  
   2015, XVIII+688, ISBN 978-3-319-15092-5
