Wolff's law 13
Orthopedic surgeons practising external fixation techniques that traverse the whole limb need detailed knowledge of the relevant anatomy. Traditional anatomical texts normally contain fewer cross-sections than are required.

In this book the authors have taken between nine and eleven cross-sections in each segment of the extremities, corresponding to sites commonly used for transfixation, or transfixing external fixation.

The cross-sections have been taken after accurate axial localisation. Safe and dangerous areas have been marked on each section, thereby indicating where transfixation is possible without damaging vessels, nerves, joints and tendons. Safe cutaneous zones are also shown. The illustrations are complemented by photographs and tomographic scans for practical reference.
