# Institute for Mathematics and its Applications (IMA)

The **Institute for Mathematics and its Applications** was established by a grant from the National Science Foundation to the University of Minnesota in 1982. The primary mission of the IMA is to foster research of a truly interdisciplinary nature, establishing links between mathematics of the highest caliber and important scientific and technological problems from other disciplines and industries. To this end, the IMA organizes a wide variety of programs, ranging from short intense workshops in areas of exceptional interest and opportunity to extensive thematic programs lasting a year. IMA Volumes are used to communicate results of these programs that we believe are of particular value to the broader scientific community.

The full list of IMA books can be found at the Web site of the Institute for Mathematics and its Applications:

<http://www.ima.umn.edu/springer/volumes.html>

Presentation materials from the IMA talks are available at

<http://www.ima.umn.edu/talks/>

## IMA ANNUAL PROGRAMS

1982–1983	Statistical and Continuum Approaches to Phase Transition
1983–1984	Mathematical Models for the Economics of Decentralized Resource Allocation
1984–1985	Continuum Physics and Partial Differential Equations
1985–1986	Stochastic Differential Equations and Their Applications
1986–1987	Scientific Computation
1987–1988	Applied Combinatorics
1988–1989	Nonlinear Waves
1989–1990	Dynamical Systems and Their Applications
1990–1991	Phase Transitions and Free Boundaries
1991–1992	Applied Linear Algebra
1992–1993	Control Theory and its Applications
1993–1994	Emerging Applications of Probability
1994–1995	Waves and Scattering
1995–1996	Mathematical Methods in Material Science
1996–1997	Mathematics of High Performance Computing

## FOREWORD

This IMA Volume in Mathematics and its Applications

### ALGORITHMS IN ALGEBRAIC GEOMETRY

contains papers presented at a highly successful one-week workshop on the same title. The event was an integral part of the 2006-2007 IMA Thematic Year on “Applications of Algebraic Geometry.” We are grateful to all the participants for making this workshop a very productive and stimulating event. Special thanks to Alicia Dickenstein (Departamento de Matemática, University of Buenos Aires), Frank-Olaf Schreyer (Mathematik und Informatik, Universität des Saarlandes), and Andrew J. Sommese (Department of Mathematics, University of Notre Dame) for their superb role as workshop organizers and editors of these proceedings.

We take this opportunity to thank the National Science Foundation for its support of the IMA.

## PREFACE

In the last decade, there has been a burgeoning of activity in the design and implementation of algorithms for algebraic geometric computation. Some of these algorithms were originally designed for abstract algebraic geometry, but now are of interest for use in applications and some of these algorithms were originally designed for applications, but now are of interest for use in abstract algebraic geometry.

The Workshop on *Algorithms in Algebraic Geometry* that was held in the framework of the IMA Annual Program Year in Applications of Algebraic Geometry by the Institute for Mathematics and Its Applications on September 18–22, 2006 at the University of Minnesota is one tangible indication of the interest. One hundred ten participants from eleven countries and twenty states came to listen to the many talks; discuss mathematics; and pursue collaborative work on the many faceted problems and the algorithms, both symbolic and numeric, that illuminate them.

This volume of articles captures some of the spirit of the IMA Workshop.

Daniel Bates, Chris Peterson, and Andrew Sommese show how the numerical algebraic geometry calculations originally aimed at applications may be used to quickly compute information about joins of varieties.

Frederic Bihan, J. Maurice Rojas, and Frank Sottile show the existence of fewnomial systems of polynomials whose number of positive real solutions equals a theoretical upper bound.

Sara Billey and Ravi Vakil, blend combinatorics and geometry, to give an algorithm for algebraically finding all flags in any zero-dimensional intersection of Schubert varieties with respect to any number of flags. This leads to a very easy method of checking that a structure constant for flag manifolds is zero.

Antonio Cafure, Guillermo Matera, and Ariel Weissbein study the problem of finding the inverse image of a point in the image of a rational map between vector spaces over finite fields. This problem is of great current interest in the coding community because it lies at the heart of a new approach to public key encryption in a world where it is ever more likely that quantum computers will allow quick factorization of integers and thereby dissolve the current encryption methods underlying secure transactions, e.g., by financial institutions.

Anton Leykin, Jan Verschelde, and Ailing Zhao study different approaches to the multiplicity structure of a singular isolated solution of a polynomial system, and, by so doing, present a “deflation method” based on higher order derivatives which effectively restores the quadratic convergence of Newton’s method lost due to the singularity of the isolated solution.

Heidi Mork and Ragni Piene study polar and reciprocal varieties for possibly singular real algebraic curves. They show that in the case when only ordinary singularities are present on the curve, these associated varieties contain nonsingular points on all components of the original curve and can be used to investigate the components of the curve. They also give an example of a curve with nonordinary singularities for which this fails.

Jiawang Nie, Pablo Parrilo, and Bernd Sturmfels investigate the  $k$ -ellipse. This is the plane algebraic curve consisting of all points such that the sum of distances from  $k$  given points is a fixed number. They show how to write its defining polynomial equation as the determinant of a symmetric matrix of linear polynomials. Their representation extends to arbitrary dimensions, and it leads to new geometric applications of semidefinite programming.

Andrew J. Sommese, Jan Verschelde, and Charles Wampler present a numerical method (based on their diagonal homotopy algorithm for intersecting varieties) with the potential to allow solution of polynomial systems, which have relatively few solutions, but whose Bézout numbers are too large to allow solution by the usual homotopy continuation methods.

Other interesting subjects presented at the Workshop include the computation of the intersection and self-intersection loci of parameterized space algebraic surfaces and the study of projections methods for the topology of algebraic curves and surfaces, which are of interest in Computer Aided Geometric Design, algorithms for finding generators of rings of invariants of algebraic groups, the relation between the structure of Gröbner bases and the decomposition of polynomial systems and the complexity of Gröbner basis computations for regular and semi-regular systems, the factorization of sparse polynomials over number fields, counting rational points on varieties over finite fields, algorithms for mixed volume computation, the effectiveness of number theory in algebraic geometry, applications of monomial ideals and computational algebra in the reverse engineering of biological networks, the description of Newton polytopes of implicit equations using Tropical Geometry, the mathematical description of Maple’s algebraic curves package and algorithms for finding all real solutions contained in a complex algebraic curve.

The interested reader can consult the talk materials and online videos of the lectures at

## CONTENTS

Foreword .....	v
Preface .....	vii
Application of a numerical version of Terracini's lemma for secants and joins .....	1
<i>Daniel J. Bates, Chris Peterson, and Andrew J. Sommese</i>	
On the sharpness of fewnomial bounds and the number of components of fewnomial hypersurfaces .....	15
<i>Frédéric Bihan, J. Maurice Rojas, and Frank Sottile</i>	
Intersections of Schubert varieties and other permutation array schemes .....	21
<i>Sara Billey and Ravi Vakil</i>	
Efficient inversion of rational maps over finite fields .....	55
<i>Antonio Cafure, Guillermo Matera, and Ariel Weissbein</i>	
Higher-order deflation for polynomial systems with isolated singular solutions .....	79
<i>Anton Leykin, Jan Verschelde, and Ailing Zhao</i>	
Polars of real singular plane curves .....	99
<i>Heidi Camilla Mork and Ragni Piene</i>	
Semidefinite representation of the $k$ -ellipse .....	117
<i>Jiawang Nie, Pablo A. Parrilo, and Bernd Sturmfels</i>	
Solving polynomial systems equation by equation .....	133
<i>Andrew J. Sommese, Jan Verschelde, and Charles W. Wampler</i>	
List of workshop participants .....	153
