Surveys and Tutorials in the Applied Mathematical Sciences

Volume 5

Editors

S.S. Antman, J.E. Marsden, L. Sirovich

Mathematics is becoming increasingly interdisciplinary and developing stronger interactions with fields such as biology, the physical sciences, and engineering. The rapid pace and development of the research frontiers has raised the need for new kinds of publications: short, up-to-date, readable tutorials and surveys on topics covering the breadth of the applied mathematical sciences. The volumes in this series are written in a style accessible to researchers, professionals, and graduate students in the sciences and engineering. They can serve as introductions to recent and emerging subject areas and as advanced teaching aids at universities. In particular, this series provides an outlet for material less formally presented and more anticipatory of needs than finished texts or monographs, yet of immediate interest because of the novelty of their treatments of applications, or of the mathematics being developed in the context of exciting applications. The series will often serve as an intermediate stage of publication of materials which, through exposure here, will be further developed and refined to appear later in one of Springer's more formal series in applied mathematics.

Preface

This book aims to give a user-friendly tutorial of an interdisciplinary research topic (fronts or interfaces in random media) to senior undergraduates and beginning graduate students with basic knowledge of partial differential equations (PDE) and probability. The approach taken is semiformal, using elementary methods to introduce ideas and motivate results as much as possible, then outlining how to pursue rigorous theorems, with details to be found in the references section.

Since the topic concerns both differential equations and probability, and probability is traditionally a quite technical subject with a heavy measure-theoretic component, the book strives to develop a simplistic approach so that students can grasp the essentials of fronts and random media and their applications in a self-contained tutorial.

The book introduces three fundamental PDEs (the Burgers equation, Hamilton–Jacobi equations, and reaction–diffusion equations), analysis of their formulas and front solutions, and related stochastic processes. It builds up tools gradually, so that students are brought to the frontiers of research at a steady pace.

A moderate number of exercises are provided to consolidate the concepts and ideas. The main methods are representation formulas of solutions, Laplace methods, homogenization, ergodic theory, central limit theorems, large-deviation principles, variational principles, maximum principles, and Harnack inequalities, among others. These methods are normally covered in separate books on either differential equations or probability. It is my hope that this tutorial will help to illustrate how to combine these tools in solving concrete problems.

The three basic equations go from their constant-coefficient forms, well studied in graduate textbooks, to their full stochastic glory with space–time-dependent random coefficients. However, they are all connected to Hamilton–Jacobi equations. The reaction–diffusion equations are classified. The KPP (Kolmogorov–Petrovsky–Piskunov) fronts are discussed in detail because of their connections with the Hamiltonian dynamics in classical mechanics and their elegant analysis. The recent mathematical advance in solving a long-standing turbulent combustion problem is presented for KPP fronts. The non-KPP reaction–diffusion fronts are associated with a Hamiltonian resembling that in special relativistic mechanics. The mechanical

connections of reaction–diffusion fronts and KPP solution methods in the spirit of Lagrangian and Eulerian perspectives are explored.

The scope of the book goes from exact solutions of scalar deterministic PDEs (Burgers, Hamilton–Jacobi, reaction–diffusion equations) to the asymptotic solutions of their stochastic counterparts. The reader will come to appreciate new random phenomena step by step, and learn that exact solutions are harder and harder to come by, while asymptotic ones are more accessible.

The first chapter of the book discusses fronts in homogeneous media, and the second chapter is on fronts in periodic media. These two chapters serve as an introduction to differential equations, their front solutions and representation formulas, and homogenization methods.

The last three chapters introduce stochastic equations, representation formulas and asymptotics, stochastic homogenization, variational methods, and large-deviation methods for analyzing random fronts.

The first three chapters are adaptations of the author’s 2000 SIAM review article with the inclusion of new results. The remaining two chapters are based on recent results on stochastic homogenization of Hamilton–Jacobi equations and KPP fronts in random media.

Acknowledgments

I would like to thank George Papanicolaou for his encouragement and interest in my work on random fronts over the years. I am grateful to James Nolen and Janek Wehr for many helpful conversations during the preparation of the book. I am thankful for the support of the National Science Foundation and the constructive comments of the anonymous referees.

Contents

1	Fronts in Homogeneous Media	1
1.1	Traveling Fronts of Burgers and Hamilton–Jacobi Equations	5
1.2	Traveling Fronts of Reaction–Diffusion Equations	7
1.3	Variational Principles of Front Speeds	11
1.4	Random Variables and Stochastic Processes	13
1.5	Noisy Burgers Fronts and the Central Limit Theorem	18
1.6	Exercises	21
2	Fronts in Periodic Media	23
2.1	Periodic Media and Homogenization	23
2.2	Reaction–Diffusion Traveling Fronts in Periodic Media	25
2.3	Existence of Traveling Waves and Front Propagation	28
2.4	KPP Fronts and Periodic Homogenization of HJ Equations	35
2.5	Fronts in Multiscale Media	44
2.6	Variational Principles, Speed Bounds, and Asymptotics	48
2.7	Exercises	51
3	Fronts in Random Burgers Equations	53
3.1	Main Assumptions and Results	53
3.2	Hopf–Cole Solutions	56
3.3	Asymptotic and Probabilistic Preliminaries	58
3.4	Asymptotic Reductions	59
3.5	Front Probing and Central Limit Theorem	63
3.6	Exercises	67
4	Fronts and Stochastic Homogenization of Hamilton–Jacobi Equations	69
4.1	Convex Hamilton–Jacobi and Variational Formulas	70
4.2	Subadditive Ergodic Theorem and Homogenization	73
4.3	Unbounded Hamiltonians: Breakdown of Homogenization	78
4.4	Normal and Accelerated Fronts in Random Flows	83
4.5	Central Limit Theorems and Front Fluctuations	86

- 4.6 Exercises 90
- 5 KPP Fronts in Random Media 93**
 - 5.1 KPP Fronts in Spatially Random Shear Flows 93
