1 Introduction: Simulating Security Returns <i>Giovanni Barone Adesi</i>	1
2 VaR without Correlations for Portfolios of Derivative Securities <i>Giovanni Barone Adesi, Kostas Giannopoulos and Les Vosper</i>	9
3 Backtesting Derivative Portfolios with FHS <i>Giovanni Barone Adesi, Kostas Giannopoulos and Les Vosper</i>	30
4 A GARCH Option Pricing Model with Filtered Historical Simulation <i>Giovanni Barone Adesi, Robert F. Engle and Lorian Mancini</i>	66
Index	109

List of Figures

2.1	The 1-day ahead distribution of German Bund futures prices	19
2.2	The 10-day ahead distribution of German Bund futures prices over 5000 runs	20
2.3	The 10-day ahead price distribution of an out-of-the money call option	21
2.4	The 10-day ahead portfolio value distribution over 5000 simulations	23
2.5	GBP Term Structure	25
2.6	Random Swaps Portfolio Values over 10-day holding period for 5000 simulation runs (y-axis is the count of values in each bar). Portfolio Values in Sterling	26
2.7	Sterling Interest Rate Term Structures: actual and after simulation, at 99th percentile and 10 day holding period	27
3.1	Sum of ten largest breaks on 10-day VaR at 99%	44
3.2	VaR across all portfolios for a 10-day horizon at 99%	45
3.3	Largest Daily Break for a 3-day VaR at 99%	45
3.4	99% Confidence level at 1-day horizon for a portfolio against profits and losses (VaR is the continuous unbroken lower line)	46
3.5	Sum of 10 largest breaks on 10-day VaR at 99%	51
3.6	Daily VaR: total for all portfolios, 10-day horizon at 99%	51
3.7	Highest daily breaks on a 3-day VaR at 99%	52

- 4.1 Daily log-returns of the S&P 500 Index from August 23, 1989 to July 9, 2003, (i.e. 3,500 log-returns), conditional GARCH volatility σ_t (on an annual base) and FHS innovations z_t . The GARCH model is estimated using the PML method with the nominal assumption of Gaussian innovations 80
- 4.2 Calibration of the GJR GARCH model with the FHS method on the cross-section of out-of-the-money SPX options on July 9, 2003. Moneyness is the strike price K divided by the spot asset price S 81
- 4.3 Absolute mispricing in percentage, that is, $100 \times (\text{model price} - \text{market price}) / \text{market price}$, of the different pricing models, averaged across Wednesdays from January 2, 2002 to December 29, 2004 for out-of-the-money SPX options. Left graphs are in-sample comparisons and right graphs are out-of-sample comparisons. Moneyness is the strike price K divided by the spot asset price S 87
- 4.4 News impact curves of the FHS, HN, and IG GARCH models based on the average pricing parameters reported in Table 4.3 for 2002, 2003, and 2004 from top to bottom 90
- 4.5 For each Wednesday t from January 2, 2002 to December 29, 2004, the graph shows VIX 30-day volatility index at time t and conditional forecast of the risk-neutral integrated volatility, $100 \times \sqrt{(365/30) \sum_{i=1}^{30} E_Q[\sigma_{t+i}^2 | \mathcal{F}_t]}$, given by the GJR model with the FHS method. 93
- 4.6 Left graphs: pricing and historical density estimates for different time horizons on July 9, 2003 95
- 4.7 Average SPD per unit probability for 2002, 2003, and 2004 (from top to bottom), and short, medium, and long maturities (from left to right) 97
- 4.8 SPD per unit probability on four consecutive Wednesdays in July 2002, July 2003, and July 2004 and for time to maturity τ closest to 100 days 99

List of Tables

2.1	GARCH estimates	16
2.2	Close prices and conditional volatility on 21 and 22 February	16
2.3	Historical standardized residuals	17
2.4	Option pricing model input values and results	21
3.1	Breaks across all portfolios	41
3.2	Cumulative break analysis for portfolios A, B, and C	42
3.3	All portfolios except A, B and C	42
3.4	Three-day VaR horizon at 99%	43
3.5	Serial correlation test on 1-day VaR	43
3.6	Breaks across all portfolios	47
3.7	Aggregated breaks for portfolios: A, B and C	48
3.8	Breaks for all members excluding A, B and C	48
3.9	Number of positive VaR's for all members	49
3.10	3-day VaR horizon at 99%	49
3.11	Autocorrelation tests for 1-day VaR	50
3.12	Breaks across 24 portfolios (constant FX)	55
3.13	Breaks across 24 portfolios (stochastic FX)	55
3.14	Serial correlation test on one-day VaR (constant FX)	56
3.15	Cumulative largest loss (break) in one day (constant FX)	56
3.17	Breaks across four portfolios	57
3.16	Portfolio description	57
3.18	Breaks across all JPY Portfolios	58
3.19	Breaks across all portfolios (LIFFE and swaps)	59
3.20	Largest loss (break) in 1 day at 5-day horizon (in '000s)	61

4.1	In- and out-of-sample pricing errors of the different pricing models	73
4.2	Database description. Mean, standard deviation (Std.) and number of observations for each moneyness/maturity category of out-of-the-money SPX options observed on Wednesdays from January 2, 2002 to December 29, 2004, after applying the filtering criteria described in the text. σ^{bs} is the Black–Scholes implied volatility	76
4.3	Calibration of the GARCH pricing models	83
4.4	Calibration of the ad hoc Black–Scholes model	84
4.5	In-sample pricing errors of the different pricing models	85
4.6	In-sample pricing errors of the different pricing models disaggregated by moneyness and maturities. See Table 4.5 for the legend.	86
4.7	Out-of-sample pricing errors of the different pricing models. See Table 4.5 for the legend	88
4.8	Out-of-sample pricing errors of the different pricing models disaggregated by moneyness and maturities. See Table 4.5 for the legend	89
4.9	Estimation and calibration of the GJR GARCH model	91
4.10	State price densities per unit probability	95
4.11	Average state price densities per unit probability	98

Acknowledgments

I would like to thank the publishers of the *Journal of Futures Markets*, *European Financial Management* and the *Review of Financial Studies* for permitting the reproduction of our articles. Robert Engle, Kostas Giannopoulos, Lorian Mancini and Les Vosper graciously agreed to let their works be reprinted. Kostas Giannopoulos and Lorian Mancini helped with the preparation of our manuscript. The financial support of the Swiss National Fund and the Swiss Finance Institute is gratefully acknowledged.

List of Contributors

Giovanni Barone Adesi is Professor of Finance at the Università della Svizzera Italiana in Lugano, Switzerland. He holds a senior chair at the Swiss Finance Institute. His research focuses on risk management and asset pricing.

Robert Engle is the Michael Armellino Professor of Finance at the Stern Business School of New York University. He received the 2003 Nobel Memorial Prize in Economics for his contributions to econometrics, in particular the modeling of volatilities of financial securities.

Kostas Giannopoulos is Professor of Finance at the Neapolis University in Cyprus. He is an expert in risk management and time-series econometrics.

Loriano Mancini is Assistant Professor of Finance at the EPFL in Lausanne, Switzerland. He holds a junior chair at the Swiss Finance Institute. His research focuses on asset pricing, liquidity and financial econometrics.

Les Vosper is a financial consultant in London, UK. He is an expert in risk management, margining and clearing.
