EDITORIAL

The articles in the general part of this Vienna Circle Institute Yearbook “Induction and Deduction in the Sciences” document the invited contributions to the 2nd international workshop of the European Science Foundation’s (ESF) Scientific Network on “Historical and Contemporary Perspectives of Philosophy of Science in Europe”. This event, which was organised by the Vienna Circle Institute, took place July 7-9, 2002 at the University of Vienna. The first workshop of this network on main issues, methods and results in history and philosophy of science in an European context was held at the Bertinoro Conference Centre of the University of Bologna from September 30 to October 2, 2001. The network is run by a coordinating committee consisting of Maria Carla Galavotti (Bologna, Italy) who has served as chairperson, Aristides Baltas (Athens, Greece), Donald Gillies (London, UK), Theo Kuipers (Groningen, The Netherlands), Ilkka Niiniluoto (Helsinki, Finland), Michel Paty (Paris, France), Miklos Rédei (Budapest, Hungary), Friedrich Stadler (Vienna, Austria), and Gereon Wolters (Konstanz, Germany). The proceedings of the first workshop have been published in a volume under the title Observation and Experiment in the Natural and Social Sciences, edited by Maria Carla Galavotti with Kluwer Academic Publishers.

The third workshop on “Laws and Models in Science” took place at King’s College London, September 7-9, 2003 and addressed problems of the structure of science, in particular the role played by theories, laws and models in several scientific fields and their different applications. Its proceedings will be published 2004 in a special volume of the “King’s College Publications”, edited by Donald Gillies.

The general aim of the ESF network from 2000 to 2003 was to identify the main features of philosophy of science in Europe today, in a spirit of continuity with a tradition that originated in Logical Empiricism (Vienna Circle and Berlin Group) in Central Europe in the first decades of the last century. Since the heyday of scientific philosophy new archival material and research accompanied by extensive transatlantic exchanges has brought forth new perspectives and results in this interdisciplinary field. These contributions have contributed to a clarification and better understanding of the nature of scientific knowledge from a historical and philosophical point of view.

2 Cf. the list of the publications of the Vienna Circle Institute: http://www.univie.ac.at/ivc/
The articles in this volume deal with the main inferential methods that can be applied to different kinds of experimental evidence. These contributions aim at removing the traditional opposition between inductivists and deductivists (e.g., by focusing on abduction) in order to explore the different methods of explanation and justification in the formal, natural and social sciences in different contexts and with different objectives.

This volume also includes critical comments made by leading scholars on methods of the sciences, especially on induction, deduction, abduction, laws, probability and explanation, ranging from logic, mathematics, natural to the social sciences. They present a highly topical pluralist re-evaluation of methodological and foundational procedures and reasoning, e.g. focusing on Bayesianism and Artificial Intelligence.

The workshop in Vienna was funded by the ESF and the organisers, the Vienna Circle Institute together with the University of Vienna, Center for Interdisciplinary Research and Department of Contemporary History. The conference and publication were made possible by the support of the editorial team of Vienna Circle Institute with Gloria Sultano, Daria Mascha, Robert Kaller, Laurence C. Fauth, Camilla R. Nielsen and Hartwig Jobst, all of whom I would like to thank for their professional cooperation. The publication of each Yearbook is supported by the Austrian Ministry of Education, Science and Culture, for which we are grateful as well.

We have retained the format of our series in the 11th volume of the Vienna Circle Yearbook with the announcement of our activities, documentation and a review section presenting recent publications on logical empiricism and related fields, for which I would like to thank our review editor Michael Stöltzner.

We have also included an obituary on Richard Jeffrey, one of the most important and distinguished 20th century philosophers of science who supported IVC from the beginning as a member of the scientific board and contributor to its conferences. We will remember his life and extraordinary work in the tradition of Logical Empiricism in the spirit of his open-minded and creative scholarship.

Vienna, October 2003
