## EDITORIAL STATEMENT

The mathematization of all sciences, the fading of traditional scientific boundaries, the impact of computer technology, the growing importance of mathematical-computer modelling and the necessity of scientific planning all create the need both in education and research for books that are introductory to and abreast of these developments.

The purpose of this series is to provide such books, suitable for the user of mathematics, the mathematician interested in applications, and the student scientist. In particular, this series will provide an outlet for material less formally presented and more anticipatory of needs than finished texts or monographs, yet of immediate interest because of the novelty of its treatment of an application or of mathematics being applied or lying close to applications.

The aim of the series is, through rapid publication in an attractive but inexpensive format, to make material of current interest widely accessible. This implies the absence of excessive generality and abstraction, and unrealistic idealization, but with quality of exposition as a goal.

Many of the books will originate out of and will stimulate the development of new undergraduate and graduate courses in the applications of mathematics. Some of the books will present introductions to new areas of research, new applications and act as signposts for new directions in the mathematical sciences. This series will often serve as an intermediate stage of the publication of material which, through exposure here, will be further developed and refined. These will appear in conventional format and in hard cover.

## MANUSCRIPTS

The Editors welcome all inquiries regarding the submission of manuscripts for the series. Final preparation of all manuscripts will take place in the editorial offices of the series in the Division of Applied Mathematics, Brown University, Providence, Rhode Island.

# Preface

These notes are the contents of a one semester graduate course which I taught at Brown University during the academic year 1981-1982. They are mainly concerned with regularity theory for obstacle problems, and with the dam problem, which, in the rectangular case, is one of the most interesting applications of Variational Inequalities with an obstacle.

Very little background is needed to read these notes. The main results of functional analysis which are used here are recalled in the text. The goal of the two first chapters is to introduce the notion of Variational Inequality and give some applications from physical mathematics. The third chapter is concerned with a regularity theory for the obstacle problems. These problems have now invaded a large domain of applied mathematics including optimal control theory and mechanics, and a collection of regularity results available seems to be timely. Roughly speaking, for elliptic variational inequalities of second order we prove that the solution has as much regularity as the obstacle(s). We combine here the theory for one or two obstacles in a unified way, and one of our hopes is that the reader will enjoy the wide diversity of techniques used in this approach.

The fourth chapter is concerned with the dam problem. This problem has been intensively studied during the past decade (see the books of Baiocchi-Capelo and Kinderlehrer-Stampacchia in the references). The relationship with Variational Inequalities has already been quoted above. Starting with a new point of view introduced by Brezis-Kinderlehrer-Stampacchia, and in a different setting by Alt, we develop the theory for general domains, and with relatively elementary techniques we give the main results on the subject including a first study of the free boundary (i.e., the one limiting the wet set of the porous medium considered).

I am especially indebted to H. Brezis from whom I learned most of this subject.

I wish also to express my thanks to my colleagues in the Applied Mathematics Division of Brown University and particularly to Constantine Dafermos and Jack Hale who helped to create such a friendly atmosphere in the Division.

Thomas Sideris and Jalal Shatah helped me to correct the manuscript; I thank them very much for their friendly assistance.

Finally, I thank Roberta Weller and Katherine MacDougall for the excellent typing of the manuscript.

# Table of Contents

	Page
PREFACE	v
CHAPTER 1. ABSTRACT EXISTENCE AND UNIQUENESS RESULTS FOR SOLUTIONS OF VARIATIONAL INEQUALITIES	1
1.1. Fixed Point Theorems	1
1.2. Motivation	1
1.3. Existence and Uniqueness Results	3
Comments	9
CHAPTER 2. EXAMPLES AND APPLICATIONS	10
2.1. Some Functional Analysis	10
2.2. The Dirichlet Problem	14
2.3. The Obstacle Problem	16
2.4. Elastic Plastic Torsion Problems	17
2.5. Nonlinear Operators	18
2.6. Fourth Order Variational Inequalities	20
Comments	21
CHAPTER 3. THE OBSTACLE PROBLEMS: A REGULARITY THEORY	22
3.1. Monotonicity Results	22
3.2. The Penalty Method	24
3.3. $W^{2,p}(\Omega)$ -Regularity ( $2 \leq p < +\infty$ )	27
3.4. Some Complementary Results	30
3.5. $W^{2,\infty}(\Omega)$ -Regularity	33
3.6. $W^{1,\infty}(\Omega)$ -Regularity	50
3.7. $W^{1,p}(\Omega)$ -Regularity ( $2 < p < +\infty$ )	60
Appendix. $L^p$ -Estimates for the Solution of the Dirichlet Problem	67
Comments	73
CHAPTER 4. THE DAM PROBLEM	74
4.1. Statement of the Problem	74
4.2. Some Properties of $(p, \chi)$ Solution of (P)	82
4.3. $S_3$ -Connected Solutions	90
4.4. Uniqueness of $S_3$ -Connected Solutions	101
4.5. Some Monotonicity Results for the Free Boundary	106
Comments	110
REFERENCES	111
INDEX	117
