Acknowledgment

The original manuscript of this book was written as a Ph.D. thesis at Delft University of Technology, where I spent about five fruitful years. This Ph.D. journey would not have been possible without the support of many people, to whom I would like to express my gratitude.

At the foremost, I thank my supervisor Kofi Makinwa. Throughout years, Kofi's belief, enthusiasm and presence was a solid supporting force, which helped me go on. I learnt from him to be as critical as I can, and how to write and to present such that others can actually understand! I am thankful to him for these lifelong skills. I also thank Han Huijsing for his support and encouragement. I would like to thank Michiel Pertijs for his invaluable support with the design of the first reference's temperature compensation.

I need to thank Omid Shoaee from Tehran University, who first raised the passion for analog circuit design in me. He told us, his students, about the glory of writing to the red journal and about being fired if the company misses time-to-market due to design mistakes. It all seemed so exciting!

Academic experience during the Ph.D. research is extremely valuable. I am thankful to Marcel Pelgrom and Lucien Breems for the opportunity of assisting them within their data converter design courses at TU Delft.

I would like to thank Greta Milczanowska and Marc van Eylen from Europractice, IMEC, for their support with the manufacture of 0.7 μm chips. I express my gratitude to Frank Thus, Paul Noten and Erik Moderegger for their invaluable support and NXP Semiconductors for fabrication of the scaled electro-thermal frequency references in 0.16 μm CMOS.

I am thankful to the wonderful room-mates at the electrical engineering faculty of TU Delft, with whom I shared lots of memories. In a chronological order: André Aita, Lukas Mol, Ferran Reverter, Caspar van Vroonhoven, Luca Giangrande, Saleh Heidary, and Zichao Tan. Caspar worked on thermal-diffusivity-based temperature sensors, which is why we enjoyed lots of fruitful discussions, technology and experience sharing, as well as a wonderful camping trip to New Zealand.

Special thanks to the staff of the Electronic Instrumentation (EI) lab of TU Delft, whose valuable work allows the department to run. During my times Inge, Trudie, Pia, Helly, Ilse and Joyce ran the secretary office. Thanks to Willem van der Sluys who made it financially feasible. Thanks to the technical staff Ger, Piet, Jeroen, Maureen, and Zu-Yao Chang. Thanks to Antoon Frehe who took care of the servers and made designing possible.

And of course, many friends and colleague whose presence in my life has meant a lot to me. In an alphabetical order: Arvin Emadi, Berenice, ChungKai Yang, Dafina Tanase, Eduardo Margallo, Frerik Witte, Gayathri, Gregory Pandraud, Kamran Souri, Lukasz, Martijn Snoeij, Morteza Alavi, Mohammad Talaie, Mohammad Mehrmohammadi, Mohammad Farazian, M. Nabavi, Nishant, Omid Noroozian, Pedram Khalili, Paulo Silva, Qinwen Fan, Rong Wu, Sha, Sharma, Shishir, Ugur, Wen Wu, Youngcheol Che, Yue Chen and Zili. Also thanks to the wonderful remote colleagues at NXP: Fabio Sebastiano and Mohammed Bolatkale.

Thanks to Sarah von Galambos for English corrections of the original Ph.D. thesis draft.

The preparation of the original thesis draft took one and half year during which I combined working and writing. This would not have been possible without the support of my colleagues at the precision systems group of Texas Instruments Delft design center (former National Semiconductor). I am especially thankful to my manager Wilko Kindt. I am also thankful to my colleagues: Frerik Witte, Jinju Wang, and Sergio Roche.

I am very much indebted to my family, my parents and my brothers, for their support and trust in me. It is thanks to their dedications and love that I have been able to pursue my dreams. Thanks to all of you.

And last but not the least: I am indefinitely thankful to my fiancée, Esmée. Without her unconditional love, understanding, and support I would not have finished this book.

Delft, The Netherlands

S. Mahdi Kashmiri

Contents

1	Introduction	1
1.1	Frequency and Its Accuracy Measures	1
1.2	Challenge of Integrating Frequency References	4
1.3	Frequency Generation Based on the Thermal Properties of Silicon	6
1.4	Motivation	9
1.5	Challenges	10
1.6	Organization of the Book	11
	References	12
2	Silicon-Based Frequency References	15
2.1	Introduction	15
2.2	Silicon MEMS Based Oscillators	17
2.3	LC Oscillators	20
2.4	RC Harmonic Oscillators	23
2.5	RC Relaxation Oscillators	25
2.6	Ring Oscillators	30
	2.6.1 Open-Loop Compensation	31
	2.6.2 Closed-Loop Compensation	32
2.7	Mobility-Based Frequency References	36
2.8	Comparison	38
2.9	Conclusions	40
	References	41
3	Frequency References Based on the Thermal Properties of Silicon	45
3.1	Introduction	45
3.2	Thermal Properties of Silicon	46
3.3	Electrothermal Filters in CMOS	51

3.4	ETF Design	54
3.4.1	General Heater Considerations	55
3.4.2	General Thermopile Considerations	55
3.4.3	Design of a Bar ETF	58
3.4.4	Design of an Optimized ETF	58
3.5	Modeling for Time-Domain Analysis	60
3.6	Thermal Oscillators	61
3.7	Electrothermal Frequency-Locked Loops	64
3.8	Electrothermal FLL as Foundation for Frequency References	69
3.9	Dynamics of an Electrothermal FLL	70
3.10	FLL Behavioral Simulations	75
3.11	The Effect of Noise on an FLL's Jitter	78
3.11.1	ETF Noise	78
3.11.2	Implications for FLL Design	80
3.11.3	VCO Noise	82
3.12	Challenges Associated with the Previous FLL's	83
3.13	Conclusions	84
	References	85
4	A Digitally-Assisted Electrothermal Frequency-Locked Loop in Standard CMOS	87
4.1	Introduction	87
4.2	Proposing a Digitally-Assisted FLL	89
