Preface

Understanding bacterial infections is more important than ever. Despite the development of antibacterial agents during the last century, bacterial infections are still one of the leading causes to worldwide morbidity and mortality. What is especially alarming is that we are entering a postantibiotic era where we have no, or very limited, treatment options to several bacterial infections previously not considered as threats (CDC. Antibiotic resistance: threat report 2013). A fundamental issue in infection biology has been, and still is: What is virulence and how does it relate to pathogenesis? There is no simple answer to this and the theoretical framework is continuously developing. The molecular dissection of Koch’s postulates made possible by the molecular genetics revolution has been instrumental in understanding bacterial-host interactions at the molecular level, but this somewhat bacteria-centered view has had its limitations in describing the whole process ranging all the way from commensalism to severe infections. Here, more recent frameworks taking both the bacterial properties and the host responses into account have gained recognition. However, theoretical frameworks will remain theoretical until they can be experimentally tested. Therefore, methodologies assessing many different aspects of bacterial infections are absolutely crucial in moving our understanding forward, for the sake of knowledge itself, and for developing novel means of controlling bacterial infections.

In this volume, Bacterial Pathogenesis: Methods and Protocols, we have had the privilege of recruiting researchers with very different methodological approaches, with the common goal of understanding bacterial pathogenesis from molecules to whole organisms. The methods describe experimentation of a wide range bacterial species, such as Streptococcus pyogenes, Streptococcus dysgalactiae, Staphylococcus aureus, Helicobacter pylori, Propionibacterium acnes, Streptococcus pneumoniae, Enterococcus faecalis, Listeria monocytogenes, Pseudomonas aeruginosa, Escherichia coli, Salmonella typhimurium, and Mycobacterium marinum. However, many of the protocols can be modified and generalized to study any bacterial pathogen of choice. Part I details very different approaches to identifying and characterizing bacterial effector molecules, from high-throughput gene-based methods, via advanced proteomics, to classical protein chemistry methods. Part II deals with structural biology of bacterial pathogenesis and how to overcome folding and stability problems with recombinantly expressed proteins. Part III describes methodology that with precision can identify bacteria in complex communities and develop our understanding of how genomes of bacterial pathogens have evolved. Part IV, the largest section, reflects the rapid development of advanced imaging techniques that can help us answer questions about molecular properties of individual live bacteria, ultrastructure of surfaces, subcellular localization of bacterial proteins, motility of bacteria within cells, and localization of bacteria within live hosts. Part V describes methods from in vitro and in vivo modeling of bacterial infections, including using zebra fish as a surrogate host, bacterial platelet activation, antimicrobial activity of host proteases, assessment of biofilms in vitro and in vivo, and using a fish pathogen as a surrogate infectious agent in a mouse model of infection. Finally, Part VI is based on the notion that bacterial pathogens are the true experts of our immune system. Therefore, immune evasion bacterial factors can, when taken out of their infectious context, be used as
powerful tools or therapeutics against immunological disorders. This is exemplified by the use of proteases from pathogenic bacteria for characterization of therapeutic antibodies, measurements of antibody orientation on bacterial surfaces, and finally the potential use of immunoglobulin active enzymes as therapy against antibody-mediated diseases.

We are indebted to John M. Walker, the series editor, for the opportunity to put this volume together and for the continuous encouragement during the whole process. Above all, we are extremely grateful to all the authors who have taken time from their busy schedules and provided us with the outstanding chapters that make up this volume. Finally, we would like to acknowledge our research environment, the Division of Infection Medicine, Department of Clinical Sciences, Lund University. This environment has fostered generations of outstanding researchers within infection biology, and we are truly standing on the shoulders of giants (no one mentioned, no one forgotten).

## Contents

**Preface** ........................................... v
**Contributors** .................................... ix

### PART I  IDENTIFICATION AND CHARACTERIZATION OF BACTERIAL EFFECTOR MOLECULES

1  Protein-Based Strategies to Identify and Isolate Bacterial Virulence Factors ........................................... 3
   *Rolf Lood and Inga-Maria Frick*

2  Analysis of Bacterial Surface Interactions with Mass Spectrometry-Based Proteomics .................................... 17
   *Christofer Karlsson, Johan Teleman, and Johan Malmström*

3  Differential Radial Capillary Action of Ligand Assay (DRaCALA) for High-Throughput Detection of Protein–Metabolite Interactions in Bacteria ................................................................. 25
   *Mona W. Orr and Vincent T. Lee*

4  Identifying Bacterial Immune Evasion Proteins Using Phage Display ......................................................... 43
   *Cindy Fevre, Lisette Scheepmaker, and Pieter-Jan Haas*

### PART II  STRUCTURAL BIOLOGY OF BACTERIAL–HOST INTERACTIONS

5  Competition for Iron Between Host and Pathogen: A Structural Case Study on Helicobacter pylori ................................. 65
   *Wei Xia*

6  Common Challenges in Studying the Structure and Function of Bacterial Proteins: Case Studies from Helicobacter pylori ................................................................. 77
   *Daniel A. Bonsor and Eric J. Sundberg*

### PART III  GENETICS AND PHYLOGENETICS OF BACTERIAL PATHOGENS

7  Development of a Single Locus Sequence Typing (SLST) Scheme for Typing Bacterial Species Directly from Complex Communities ................................................................. 97
   *Christian F.P. Scholz and Anders Jensen*

8  Reconstructing the Ancestral Relationships Between Bacterial Pathogen Genomes ......................................................... 109
   *Caitlin Collins and Xavier Didelot*

### PART IV  BACTERIAL IMAGING APPROACHES AND RELATED TECHNIQUES

9  Making Fluorescent Streptococci and Enterococci for Live Imaging ................................................................. 141
   *Sarah Shabayek and Barbara Spellerberg*
10 Computer Vision-Based Image Analysis of Bacteria ............................................. 161
   Jonas Danielsen and Pontus Nordenfelt
11 Assessing Vacuolar Escape of Listeria monocytogenes ................................... 173
   Juan J. Quereda, Martin Sachse, Damien Balestrino, Théodore Grenier,
   Jennifer Fredlund, Anne Danckaert, Nathalie Aulner, Spencer Shorte,
   Jost Enninga, Pascale Cossart, and Javier Pizarro-Cerdá
12 Immobilization Techniques of Bacteria for Live Super-resolution
   Imaging Using Structured Illumination Microscopy ......................................... 197
   Amy L. Bottomley, Lynne Turnbull, Cynthia B. Whitchurch, and Elizabeth J. Harry
13 Negative Staining and Transmission Electron Microscopy
   of Bacterial Surface Structures ............................................................................. 211
   Matthias Mörgelin
14 Detection of Intracellular Proteins by High-Resolution
   Immunofluorescence Microscopy in Streptococcus pyogenes ............................... 219
   Assaf Raz
15 Antibody Guided Molecular Imaging of Infective Endocarditis Infection ........... 229
   Kenneth L. Pinkston, Peng Gao, Kavindra V. Singh, Ali Azhdarinia,
   Barbara E. Murray, Eva M. Sevick-Muraca, and Barrett R. Harvey

PART V MODELS FOR STUDYING BACTERIAL PATHOGENESIS

16 The Zebrafish as a Model for Human Bacterial Infections ................................. 245
   Melody N. Neely
17 Determining Platelet Activation and Aggregation
   in Response to Bacteria ......................................................................................... 267
   Oonagh Shannon
18 Killing Bacteria with Cytotoxic Effector Proteins of Human Killer
   Immune Cells: Granzymes, Granulysin, and Perforin ......................................... 275
   Diego López León, Isabelle Fellay, Pierre-Yves Mantel, and Michael Walch
19 In Vitro and In Vivo Biofilm Formation by Pathogenic Streptococci .................. 285
   Yashuan Chao, Caroline Bergenzelz, and Anders P. Hakansson
20 Murine Mycobacterium marinum Infection as a Model for Tuberculosis .......... 301
   Julia Lienard and Fredric Carlsson

PART VI METHODS EXPLOITING BACTERIAL IMMUNE EVASION

21 Generating and Purifying Fab Fragments from Human and Mouse IgG
   Using the Bacterial Enzymes IdeS, SpeB and Kgp ............................................ 319
   Jonathan Sjögren, Linda Andersson, Malin Mejäre, and Fredrik Olsson
22 Measuring Antibody Orientation at the Bacterial Surface ................................ 331
   Oonagh Shannon and Pontus Nordenfelt
23 Toward Clinical use of the IgG Specific Enzymes IdeS and EndoS
   against Antibody-Mediated Diseases ................................................................. 339
   Mattias Collin and Lars Björck
