Protein–Protein Interactions

Methods and Applications

Edited by

Haian Fu

Department of Pharmacology
Emory University School of Medicine, Atlanta, GA
Preface

As the mysteries stored in our DNA have been more completely revealed, scientists have begun to face the extraordinary challenge of unraveling the intricate network of protein–protein interactions established by that DNA framework. It is increasingly clear that proteins continuously interact with one another in a highly regulated fashion to determine cell fate, such as proliferation, differentiation, or death. These protein–protein interactions enable and exert stringent control over DNA replication, RNA transcription, protein translation, macromolecular assembly and degradation, and signal transduction; essentially all cellular functions involve protein–protein interactions. Thus, protein–protein interactions are fundamental for normal physiology in all organisms. Alteration of critical protein–protein interactions is thought to be involved in the development of many diseases, such as neurodegenerative disorders, cancers, and infectious diseases. Therefore, examination of when and how protein–protein interactions occur and how they are controlled is essential for understanding diverse biological processes as well as for elucidating the molecular basis of diseases and identifying potential targets for therapeutic interventions.

Over the years, many innovative biochemical, biophysical, genetic, and computational approaches have been developed to detect and analyze protein–protein interactions. This multitude of techniques is mandated by the diversity of physical and chemical properties of proteins and the sensitivity of protein–protein interactions to cellular conditions. In order to provide scientists with practical tools to address their vital biological questions in the post-genome era, Protein–Protein Interactions: Methods and Applications presents a collection of frequently employed techniques for identifying protein interaction partners, qualitatively or quantitatively measuring protein–protein interactions in vitro or in vivo, monitoring protein–protein interactions as they occur in living cells, and determining interaction interfaces. It is hoped that this book will be useful to a broad spectrum of researchers who are interested in studying protein–protein interactions in various systems.

Protein–Protein Interactions: Methods and Applications consists of five sections. It begins with two concise overviews of the fundamental principles of protein–protein interactions. They illustrate the structural diversity of protein interactions and some common experimental design considerations that
are important for quantification of these interactions. Part Two describes a wide range of biochemical and biophysical methods for detecting and measuring protein–protein interactions in vitro. Commonly used spectroscopic, electrophoretic, and affinity matrix–based techniques are presented, many of which allow quantitative analysis of protein–protein interactions. This section ends with tools for analyzing structural interfaces and the design of peptide inhibitors of protein interactions. Advances in genetics and molecular biology have revolutionized the way that we study protein–protein interactions. Part Three reflects these changes and covers popular methods for studying protein–protein interactions in heterologous cell systems, including various bacterial, yeast, and mammalian two-hybrid systems and co-immunoprecipitation studies. These methods provide a simple solution for analyzing protein–protein interactions in an in vivo environment. Part Four presents state of the art methodologies to monitor protein–protein interactions in living cells, including applications using the fluorescence resonance energy transfer (FRET) technology. These approaches share a common bond in that they allow the capture and visualization of protein–protein interactions as they occur. In the post-genome age, it is expected that conventional methods for studying protein–protein interactions will still play an important role. However, it is hoped that proteomics and bioinformatics-based approaches will be rapidly developed to study protein–protein interactions on a large scale. Part Five begins to address this issue, focusing on high-throughput methods and computational approaches. This section ends with a tutorial on using Internet resources, which serves as a springboard to additional information and techniques for studying protein–protein interactions.

Both basic and clinical researchers will find this book valuable for its broad coverage from simple affinity-based pull-down assays to cutting edge technologies such as FRET and solid-phase isotope tagging–based mass spectrometry. The basic theory and practical application of these widely used, representative methods are described in detail by experienced researchers. Examples are also incorporated to illustrate each method, along with notes and explanations for sensitive procedures and potential pitfalls. These features, together with our broad coverage of the topic, are designed to empower readers in their quest to decipher the functions of proteins and complex biological regulatory systems.

It is truly a great pleasure to put together a book on this important, exciting, and timely topic! I have been privileged to work with the many leaders in the protein–protein interaction field who willingly contributed their valuable time and effort to making this book possible. I am grateful to each of the contributors for their enthusiasm and tremendous efforts and to John Walker,
the series editor, and Craig Adams, James Geronimo, and all at Humana Press for their guidance. My sincere thanks go to Shane Masters, Keith Wilkinson, and Jonathan Cooper for their invaluable advice and suggestions and to Lisa Cockrell and Robert Fu for assistance in preparing this book. Finally, I express my deepest appreciation to Robert, Emily, and Guo-hua, who provide constant encouragement and support.

Contents

Preface ............................................................................................................................. v
Contributors ................................................................................................................... xiii

PART I. OVERVIEW

1 Structural Basis of Protein–Protein Interactions
   Robert C. Liddington ......................................................................................... 3

2 Quantitative Analysis of Protein–Protein Interactions
   Keith D. Wilkinson .......................................................................................... 15

PART II. IN VITRO TECHNIQUES

3 Characterization of Protein–Protein Interactions
   by Isothermal Titration Calorimetry
   Adrian Velazquez-Campoy, Stephanie A. Leavitt, and Ernesto Freire
................................................................................................................................. 35

4 Circular Dichroism Analysis for Protein–Protein Interactions
   Norma J. Greenfield .......................................................................................... 55

5 Protein–Protein Interaction Analysis by Nuclear Magnetic Resonance Spectroscopy
   Guanghua Gao, Jason G. Williams, and Sharon L. Campbell ................. 79

6 Measuring Rhodopsin–G-Protein Interactions
   by Surface Plasmon Resonance
   John Northup ...................................................................................................... 93

7 Using Light Scattering to Determine the Stoichiometry
   of Protein Complexes
   Jeremy Mogridge .............................................................................................. 113

8 Sedimentation Equilibrium Studies
   Ian A. Taylor, John F. Eccleston, and Katrin Rittinger .................................... 119

9 Analysis of Protein–Protein Interactions by Simulation
   of Small-Zone Gel Filtration Chromatography
   Rosemarie Wilton, Elizabeth A. Myatt, and Fred J. Stevens ..................... 137

10 Fluorescence Gel Retardation Assay to Detect
    Protein–Protein Interactions
    Sang-Hyun Park and Ronald T. Raines ..................................................... 155
11 Fluorescence Polarization Assay to Quantify Protein–Protein Interactions
   Sang-Hyun Park and Ronald T. Raines ........................................... 161

12 Studying Protein–Protein Interactions via Blot Overlay or Far Western Blot
   Randy A. Hall ........................................................................... 167

13 Glutathione-S-Transferase–Fusion Based Assays for Studying Protein–Protein Interactions
   Haris G. Vikis and Kun-Liang Guan ........................................... 175

14 Affinity Capillary Electrophoresis Analyses of Protein–Protein Interactions in Target-Directed Drug Discovery
   William E. Pierceall, Lixin Zhang, and Dallas E. Hughes ........... 187

15 Mapping Protein–Ligand Interactions by Hydroxyl-Radical Protein Footprinting
   Nick Loizos ........................................................................... 199

16 Use of Phage Display and Polyvalency to Design Inhibitors of Protein–Protein Interactions
   Michael Mourez and R. John Collier ....................................... 213

PART III. DETECTING PROTEIN–PROTEIN INTERACTIONS IN HETEROLOGOUS SYSTEMS

17 A Bacterial Two-Hybrid System Based on Transcriptional Activation
   Simon L. Dove and Ann Hochschild ....................................... 231

18 Using the Yeast Two-Hybrid System to Identify Interacting Proteins
   John Miller and Igor Stagljar ............................................. 247

19 Analysis of Protein–Protein Interactions Utilizing Dual Bait Yeast Two-Hybrid System
   Ilya G. Serebriiskii and Elena Kotova .................................. 263

20 The Split-Ubiquitin Membrane-Based Yeast Two-Hybrid System
   Safia Thaminy, John Miller, and Igor Stagljar ....................... 297

21 Reverse Two-Hybrid Techniques in the Yeast Saccharomyces cerevisiae
   Matthew A. Bennett, Jack F. Shern, and Richard A. Kahn ...... 313

22 Mammalian Two-Hybrid Assay for Detecting Protein–Protein Interactions In Vivo
   Jae Woon Lee and Soo-Kyung Lee ........................................ 327

23 Co-Immunoprecipitation from Transfected Cells
   Shane C. Masters ................................................................... 337
PART IV: PROBING PROTEIN–PROTEIN INTERACTIONS IN LIVING CELLS

24 Microscopic Analysis of Fluorescence Resonance Energy Transfer (FRET)
  Brian Herman, R. Venkata Krishnan, and Victoria E. Centonze .............................................................. 351

25 Monitoring Molecular Interactions in Living Cells Using Flow Cytometric Analysis of Fluorescence Resonance Energy Transfer
  Francis Ka-Ming Chan ........................................................................... 371

26 Fluorescence Correlation Spectroscopy: A New Tool for Quantification of Molecular Interactions
  Keith M. Berland ................................................................................ 383

27 Confocal Microscopy for Intracellular Co-Localization of Proteins
  Toshiyuki Miyashita .......................................................................... 399

28 Mapping Biochemical Networks with Protein-Fragment Complementation Assays
  Ingrid Remy and Stephen W. Michnick ........................................... 411

29 In Vivo Protein Cross-Linking
  Fabrice Agou, Fei Ye, and Michel Véron ........................................ 427

PART V. PROTEOMICS-BASED APPROACHES

30 Computational Prediction of Protein–Protein Interactions
  John C. Obenauer and Michael B. Yaffe ......................................... 445

31 Affinity Methods for Phosphorylation-Dependent Interactions
  Greg Moorhead and Carol MacKintosh ........................................... 469

32 Two-Dimensional Gel Electrophoresis for Analysis of Protein Complexes
  Karin Barnouin ................................................................................... 479

33 Sample Preparation of Gel Electrophoretically Separated Protein Binding Partners for Analysis by Mass Spectrometry
  Rainer Cramer, Malcolm Saxton, and Karin Barnouin .................. 499

34 Quantitative Protein Analysis by Solid Phase Isotope Tagging and Mass Spectrometry
  Huilin Zhou, Rosemary Boyle, and Ruedi Aebersold ................... 511

35 Internet Resources for Studying Protein–Protein Interactions
  Shane C. Masters ............................................................................... 519
