No one saves us but ourselves. No one can and no one may. We ourselves must walk the path.

Buddha

The Baltic Sea is regarded as the most damaged sea in the world. Some of the major challenges in the Baltic Sea region are its eutrophication (caused by nutrient pollution), hypoxia (low oxygen), hazardous substances, oil spills, invasive species, marine litter and resulting changes in flora and fauna. To discuss some of these challenges, we organized an International Workshop in May 2016, during which the idea for this edited book precipitated. My gratitude and thanks are due to all the contributing authors of this edited volume who also provided stimulating intellectual discussions and inputs during the workshop—Stig Blomskog, Patrik Dinnetz, Katarina Elofsson, Ing-Marie Gren, Kari Lehtilä, Mari Jüssi, Markus Larsson, Helen Poltimäe, Sirje Pädam, Tea Nõmmann and Tomasz Zyliz. For excellent research assistance and support, a special thanks to Dr. Ashim Kar. Thank you Aimee Dibbens and Thomas Coughlan for your support, expertize and encouragement through the publication process.

Grant from the Center for Baltic and East European Studies, (CBEEES), Södertörn University, to organize the workshop is gratefully acknowledged. I am particularly grateful to Ester Appelgren, Mats Bergman, Peter Dobers, Joakim Ekman Tinni Ernsjö Rappe, Leo Foderus, Ann-Sofie Köping, Chuan-Zhong Li, Xiang Lin, Lin Lerpold, Rebecka Lettevall, Lars-gunnar Mattsson, Örjan Sjöberg, Staffan Stockeld, Yves Surrey, Susanne Sweet, Anh Mai Thi Van and Fan-Yang Wallentin for their inputs and support. For excellent administrative support, I thank Helena Detlof, Monica Johansson, Vit Kysilka, Rose-Marie Tengvert and Charlotta Törmä.

For their unconditional love and support I remain deeply indebted to my parents, Bau, Ravina, Simran, Kabir and Ashok!

List of Figures

Fig. 2.1	Principles of ecological recycling agriculture	19
Fig. 2.2	Surplus of nitrogen and phosphorus, kg/ha & yr, in farm-gate and field balances calculated for four alternative governance regimes: Today's agriculture situation (Today's situation); a scenario where agriculture in Poland and the Baltic countries converts to conventional agriculture similar to that in Sweden (Conventional scenario); all agriculture in the Baltic Sea drainage area converts to ERA as practised in the respective countries (ERA Scenario 1); all agriculture converts to ERA as practised in Sweden (ERA Scenario 2). Field surplus equals farm-gate surplus minus ammonia (NH ₄) losses, see Table 2.1	28
Fig. 2.3	Crop and animal production in the Conventional (Conv.) scenario and two alternative ERA scenarios (1, 2), which resulted in increased, reduced and (close to) unchanged agricultural production, respectively, compared with today's average agriculture	32

x **List of Figures**

Fig. 3.1	Allocation of costs on countries for achieving 50% reduction in phosphorus and 15% reduction in nitrogen pools in 60 years in the reference case and with effects of climate change and technological development with and without certainty (<i>SWE</i> Sweden, <i>DEN</i> Denmark, <i>FIN</i> Finland, <i>POL</i> Poland, <i>EST</i> Estonia, <i>LAT</i> Latvia, <i>LIT</i> Lithuania, <i>GER</i> Germany, <i>RUS</i> Russia)	69
Fig. 3.2	Optimal time paths of annual discounted abatement costs in the reference case and with climate change and technological development with and without uncertainty	70
Fig. 4.1	Timing of events	83
Fig. 4.2	Expected utility for alternative strategies for monitoring, under different assumptions about monitoring and abatement cost, and risk aversion	93
Fig. 5.1	Distribution of measures of the national marine strategies by descriptor	113
Fig. 6.1	Main modes of commuting to work, percentage of occupied in Tallinn, 2000–2015	144
Fig. 6.2	Willingness to change main travel mode of daily car users	149

List of Tables

Table 2.1	Arable land (million hectare, Mha), total load (according to calculations from HELCOM 2005) and calculated total farm-gate surplus of nitrogen (N) and phosphorus (P) and ammonia (NH ₄) losses (40%), expressed per unit area (kg/ha) and as kilotonnes per year (kt/yr) in average agriculture and for ERA farms	26
Table 3.1	BAU loads of nitrogen and phosphorus loads, abatement cost functions and risk premium in riparian countries in 2008	65
Table 3.2	Nutrient pools, carry-over rates, targets and uncertainty quantification in pools and targets	67
Table 4.1	Change in expected utility compared to baseline, when parameters are changed	94
Table 4.2	Critical threshold values for change of strategy	97
Table 5.1	Qualitative descriptors for determining good environmental status	108
Table 5.2	Measures by type in the national programme of measures	114
Table 6.1	Results of logit models in the form of odds ratio	147

xii **List of Tables**

Table 9.1	Environmental attitudes in Estonia and Baltic region (Estonia and Poland excluded)	211
Table 9.2	Ordered logit marginal effect for the respondents who stated they were very and fairly willing to accept cuts in their standard of living (standard errors in parenthesis)	214
Table 9.3	Ordered logit marginal effect for the respondents who stated they were very and fairly willing to pay much higher taxes (standard errors in parenthesis)	215
Table 9.4	Ordered logit marginal effects for the respondents who were very and fairly willing to pay much higher prices (standard errors in parentheses)	216
Table 10.1	Cost-effective abatement of nitrogen in the Baltic drainage basin	225
Table 10.2	Hypothetical Baltic transfers	228
Table 10.3	Alternative hypothetical Baltic transfers	230
