Preface

Why would I like to introduce and explore Industrial Ecology (IE) and Industrial Symbiosis (IS) from an operations management (OM) perspective?

IE considers developing and transforming industrial systems to industrial ecosystems, which have high levels of nearly closed-loop material exchanges and efficiency of energy cascading. IS, as one area within IE, explores ways of developing knowledge webs to facilitate the establishment of novel material exchanges and energy cascading within and across companies and industries. Applying IE and IS effectively dramatically improve environmental sustainability.

OM aims to continuously improve the efficiency and effectiveness of processes for producing goods and providing services to customers. However, a process in OM is considered as a linear transformation. Where raw materials come from and where industrial waste and after-use products go have not been considered purposefully. Linear transformation thinking needs to be replaced by closed-loop thinking in OM in order to successfully transform industrial systems to industrial ecosystems and be sustainable in the long run.

Industrial waste, by-products or residues generate environmental benefits, economic values and reduce the burden to societies if they can be reused, remanufactured or recycled as feedstock to another process. Reduction of disposals along all stages of a product life cycle, including the product after-use stage, contributes to environmental sustainability as well as economic and social sustainability. After-use products should also be considered for their re-entry to industrial systems through the application of reuse, remanufacturing and recycling options, with the assistance of design for environment (DfE). This allows after-use products to re-enter circulations in our industrial systems as resources instead of being disposed of into our natural environment. This can dramatically reduce the intake of virgin materials and pollutant and waste emissions to our natural environment.

This idea is not new and was proposed by Froesch and Gallopoulos in 1989. However, why are OM transformation processes still being considered and taught in a linear transformation representation of inputs and outputs? Shouldn't all processes and systems work towards nearly closed-loop industrial ecosystems in an extended system view?

It has not been an easy journey for me to fully understand the principles and purposes of IE and IS through exploring their definitions and applications in the literature, as the literature offers different and in some cases conflicting views. Writing this book has given me an opportunity to explore IE and IS in great depth and has clarified a number of queries I have had over the last few years. I hope this book can also help readers reappraise and elucidate their own thinking regarding IE and IS and their roles in achieving environmental sustainability. If that is the case, I have achieved my purpose.

Sheffield, UK,
September 2017

Xiaohong Li

Acknowledgements

I would like to thank Mr. Michael Leigh, my co-author for a journal article on Industrial Ecology and Industrial Symbiosis published in *the Journal of Cleaner Production* in 2015. I thank him for bringing my attention to Industrial Ecology and Industrial Symbiosis and the opportunities they presented for research within the Operations Management field. I would like to thank the editor Josie Taylor at Palgrave, whom I met at the European Operations Management conference (EurOMA) in 2015 for her great support for me to initialise this book proposal in 2016. I also thank the editorial assistant Lucy Kidwell and the editorial team in the Business and Management Scholarly & Reference Division, for their time and effort in communicating with me while I was working on this book. It has been challenging time wise to work on this book without being able to dedicate considerable time, energy and effort in a short space of time to bring this project to a conclusion sooner as planned, as I have a full time lecturing job at the Sheffield Business School, Sheffield Hallam University. Thanks to Lucy for her patience in bearing with me until the final date of submission.

I would like to give my huge thanks to my dear friends Dr. Lisa Trehwitt, Mrs. Nicola Livesey and Mr. Allan Dixon who had proofread

my draft chapters. Without their proofreading, the book would not read as well as it does!

Thanks to my dear mother, Mrs. Xiangyun Yu, and my late father, Mr. Benling Li, who were both professors in Biology before their retirement, for their lifelong encouragement to my learning and achievement.

Thanks to my darling eight-year old daughter, little Miss Jasmine Dixon, for understanding that Mummy had to spend many weekends writing this book without being able to go out visiting places with her and her Daddy.

Finally, I wish to thank my readers in advance who are interested in making this world a better place by taking Industrial Ecology and Industrial Symbiosis into their learning and practice. It is you who will make the difference!
