PREFACE

As is known, by energy methods (EM) one denotes a suitable mathematical device for deriving estimates of solutions to differential equations. The name of the method is due to the fact that it is usually founded upon "conservation laws" which must be obeyed by solutions. A typical example of EM, and maybe one of the earliest, is given by the approach introduced at the end of the nineteenth century by the Russian mathematician A.M. Liapounov for studying the stability of solutions to ordinary differential equations. Actually, this approach is based on the existence of a suitable functional which must be positive and non-increasing in time (the so-called "Liapounov functional"). Another no less important example of EM is furnished by the method proposed by J. Serrin in 1959 and successively generalized and deepened by D.D. Joseph and his co-workers, for studying nonlinear stability of viscous incompressible flows in bounded domains. Roughly speaking, the method consists in forming the "kinetic energy" of perturbations to a given basic flow and in studying its behavior in time (see Chapter I). Of course, there are several other examples of applicability of EM, such as uniqueness, existence, etc., and for some of them the reader is referred to the papers cited throughout these Notes.

Aside from the above EM, there are the so-called weighted energy methods (WEM). Unlike the former, the latter explicitly involve the use of suitable auxiliary functions (weight functions) whose task may vary from case to case, depending on the kind of problem one is dealing with. In fluid dynamics, they were originally introduced by the writers in 1975 for studying uniqueness of unsteady viscous flows in unbounded regions. By using suitable spatially weighted norms, they were able to prove uniqueness without prescribing the velocity field at large spatial distances. Since then, WEM have been widely applied to other branches of mathematical physics (magnetohydrodynamics, elasticity, viscoelasticity, etc.) and used to solve different kinds of questions such as existence, continuous data dependence and stability as well. Moreover, they turn out to be useful also in investigating well-posedness problems in bounded domains.

The aim of these Notes is to give an account of WEM and to show how they work in solving several problems arising in fluid dynamics (Part One) and elasticity (Part Two). Of course, we did not consider all possible applications of the method and, among others, we left out important questions such as uniqueness and continuous data dependence of viscous incompressible flows in unbounded domains; however, we refer the interested reader to the recent Monograph of B. Straughan (Ref. 5 to Chapter II).

Acknowledgments

These notes mostly summarize the research developed by the authors in the last years with the support of GNFM of Italian CNR and a contract MPI 40%. Both Firms are, therefore, gratefully acknowledged.

These Notes are also, in part, the content of a series of lectures which the first author gave at the "Workshop on Exterior Domain Problems" at Howard University, Washington, D.C., June 20-24, 1983. He wishes to thank the Director of the Workshop, Professor Isom H. Herron, for his kind invitation and his unselfish help, and the Chairman of the Department of Mathematics, Professor J.A. Donaldson, for providing him with a Howard University Visiting Scientist appointment during the tenure of which these Notes were completed. He also thanks all his colleagues and friends at Howard for their kind and warm hospitality.

Last but not least, the authors are grateful to Mrs. M. McCalop for her superb job of typing.

TABLE OF CONTENTS

PREFACE iii

PART ONE

WEIGHTED ENERGY METHODS IN FLUID DYNAMICS

Chapter

I. INTRODUCTORY TOPICS ON STABILITY OF VISCOUS FLOWS 1

1.1 Statement of the Stability Problem 1

1.2 The Linear Stability Method 3

1.3 Energy Methods for Nonlinear Stability in Bounded Domains 7

References to Chapter I 13

II. ENERGY METHODS IN UNBOUNDED DOMAINS: THE CASE OF A HALF SPACE 14

2.1 Preliminary Considerations 14

2.2 Weighted Poincaré Inequality 15

2.3 The Energy Relations in a Half Space 17

2.4 Universal Stability 20

2.5 Asymptotic Stability 24

2.6 Variational Formulation 29

2.7 Applications 32

References to Chapter II 35

III. ENERGY METHODS IN UNBOUNDED DOMAINS: THE CASE OF AN EXTERIOR DOMAIN. . 36

3.1 Weighted Poincaré Inequalities 36

3.2 The Energy Relations 39

3.3 Universal Stability 40

3.4 Asymptotic Stability 41

3.5 Variational Methods 45

3.6 On the Applicability of the Stability Criteria 48

References to Chapter III 48

Chapter

IV.	SOME PROPERTIES OF STEADY SOLUTIONS IN EXTERIOR DOMAINS	49
	4.1 Preliminaries	49
	4.2 D-solutions and Their Properties	49
	4.3 Further Properties of D-solutions for Arbitrary Reynolds Numbers	51
	References to Chapter IV	54
V.	EXCHANGE OF STABILITIES, SYMMETRY AND THE CONNECTION BETWEEN LINEAR AND NONLINEAR STABILITY	55
	5.1 Symmetry, Linear and Nonlinear Stability	55
	5.2 Applications of Theorem 5.3	59
	5.3 Nonsymmetric Operators and Stability	63
	5.4 Stability of Couette Flow Between Coaxial Cylinders Within the Mean Radius Approximation in the Narrow Gap Limit	68
	5.5 Energy Stability in Bio-convection	71
	5.6 Nonlinear Stability of a Diffusion Equation	73
	References to Chapter V	77
VI.	SKEW-SYMMETRIC OPERATORS AND NONLINEAR STABILIZATION: THE HYDROMAGNETIC BENARD PROBLEM	78
	6.1 Skew-symmetric Operators and Stabilization	78
	6.2 Statement of the Problem	79
	6.3 Generalized Energy Theory for the Linearized Problem	81
	6.4 Stability of the Nonlinear Problem	87
	References to Chapter VI	91

PART TWO

WEIGHTED ENERGY METHODS IN ELASTICITY

Chapter

VII.	WEIGHTED ENERGY METHODS IN ELASTOSTATICS ON UNBOUNDED DOMAINS	92
	7.1 Uniqueness in Linear Elastostatics: Statement of the Problem . . .	92
	7.2 Uniqueness and Continuous Dependence in Linear Elastostatics . . .	95
	7.3 A Saint-Venant Principle for the Semi-infinite Elastic Cylinder: Preliminaries	98

Chapter

7.4.	Asymptotic Behavior in the Nonlinear Elastic Beam	102
	References to Chapter VII	107
VIII.	WEIGHTED ENERGY METHODS IN LINEAR ELASTODYNAMICS IN UNBOUNDED DOMAINS	108
8.1.	Uniqueness and Continuous Dependence in Linear Electrodynamics with Definiteness Assumptions on the Elasticities	108
8.2.	Continuous Data Dependence without Definiteness Conditions on the Elasticities	112
	References to Chapter VIII	119
