Facial rejuvenation, once almost solely a surgical technique for the treatment of aging skin, has increasingly become a discipline involving the synergistic use of noninvasive approaches. Today, the nonsurgical approach to facial rejuvenation involves the use of a combination of lasers and laser-like technologies, used in conjunction with fillers and botulinum toxins. Nonsurgical laser and light-based treatment of the skin now also encompasses subcategories of treatment such as photodynamic photorejuvenation and photomodulation with light emitting diodes (LEDs). The esthetic physician may also use a variety of peels, mesotherapy, and topical cosmeceuticals to optimize the process of facial rejuvenation.

This book is divided into eight chapters, each written by an international expert in his or her respective field. All chapters, where appropriate, have a unifying theme. Chapters start with bulleted “Core Messages”. This is then followed with chapter sections taking a look at currently available technologies, advantages, disadvantages, indications, contraindications, patient’s informed consent, author’s personal approach, postoperative care and complications, results and photographs and finally the author’s look to the future with respect to each treatment approach to facial rejuvenation.

Facial Rejuvenation is meant as a primer for any physician interested in the total approach to the noninvasive treatment of aging skin.
