Preface

Since 1972 and the appearance of the famous Black & Scholes option pricing formula, derivatives have become an integrated part of everyday life in the financial industry. Options and derivatives are tools to control risk exposure, and used in the strategies of investors speculating in markets like fixed-income, stocks, currencies, commodities and energy.

A combination of mathematical and economical reasoning is used to find the price of a derivatives contract. This book gives an introduction to the theory of *mathematical finance*, which is the modern approach to analyse options and derivatives. Roughly speaking, we can divide mathematical finance into three main directions. In *stochastic finance* the purpose is to use economic theory with stochastic analysis to derive fair prices for options and derivatives. The results are based on stochastic modelling of financial assets, which is the field of *empirical finance*. Numerical approaches for finding prices of options are studied in *computational finance*. All three directions are presented in this book. Algorithms and code for Visual Basic functions are included in the numerical chapter to inspire the reader to test out the theory in practice.

The objective of the book is *not* to give a complete account of option theory, but rather relax the mathematical rigour to focus on the ideas and techniques. Instead of going deep into stochastic analysis, we present the intuition behind basic concepts like the Itô formula and stochastic integration, enabling the reader to use these in the context of option theory. To comprehend the theory, a background in mathematics and statistics at bachelor level (that means, calculus, linear algebra and probability theory) is recommended.

This book is a revision of the Norwegian edition which appeared in 2001. It is used in a course for students at the University of Oslo preparing for a master in finance and insurance mathematics. The manuscript for the Norwegian edition grew from lecture notes prepared for an introductory course in modern finance for the industry.

Several people have contributed in the writing of this book. I am grateful to Jūratė Šaltytė-Benth for carefully reading through the manuscript and significantly improving the presentation, and Neil Shephard for providing me with Ox software to do statistical analysis of financial time series. Furthermore, the advice given and corrections made by Jeffrey Boys, Daniela Brandt,

VIII Preface

Table of Contents

1	Introduction	1
1.1	An Introduction to Options in Finance	1
1.1.1	Empirical Finance	5
1.1.2	Stochastic Finance	6
1.1.3	Computational Finance	6
1.2	Some Useful Material from Probability Theory	6
2	Statistical Analysis of Data from the Stock Market	11
2.1	The Black & Scholes Model	12
2.2	Logarithmic Returns from Stocks	15
2.3	Scaling Towards Normality	19
2.4	Heavy-Tailed and Skewed Logreturns	20
2.5	Logreturns and the Normal Inverse Gaussian Distribution ...	23
2.6	An Alternative to the Black & Scholes Model	28
2.7	Logreturns and Autocorrelation	28
2.8	Conclusions Regarding the Choice of Stock Price Model	31
3	An Introduction to Stochastic Analysis	33
3.1	The Itô Integral	33
3.2	The Itô Formula	38
3.3	Geometric Brownian Motion as the Solution of a Stochastic Differential Equation	44
3.4	Conditional Expectation and Martingales	46
4	Pricing and Hedging of Contingent Claims	53
4.1	Motivation from One-Period Markets	54
4.2	The Black & Scholes Market and Arbitrage	58
4.3	Pricing and Hedging of Contingent Claims $X = f(S(T))$	60
4.3.1	Derivation of the Black & Scholes Partial Differential Equation	60
4.3.2	Solution of the Black & Scholes Partial Differential Equation	63
4.3.3	The Black & Scholes Formula for Call Options	65
4.3.4	Hedging of Call Options	67
4.3.5	Hedging of General Options	70

4.3.6	Implied Volatility.....	72
4.4	The Girsanov Theorem and Equivalent Martingale Measures .	73
4.5	Pricing and Hedging of General Contingent Claims	77
4.5.1	An Example: a Chooser Option	79
4.6	The Markov Property and Pricing of General Contingent Claims	81
4.7	Contingent Claims on Many Underlying Stocks.....	83
4.8	Completeness, Arbitrage and Equivalent Martingale Measures	86
4.9	Extensions to Incomplete Markets	88
4.9.1	Energy Markets and Incompleteness	91
5	Numerical Pricing and Hedging of Contingent Claims	99
5.1	Pricing and Hedging with Monte Carlo Methods.....	99
5.1.1	Pricing and Hedging of Contingent Claims with Payoff of the Form $f(S_T)$	100
5.1.2	The Accuracy of Monte Carlo Methods	104
5.1.3	Pricing of Contingent Claims on Many Underlying Stocks	105
5.1.4	Pricing of Path-Dependent Claims.....	107
5.2	Pricing and Hedging with the Finite Difference Method	112
A	Solutions to Selected Exercises	121
	References	157
	Index	161
