

Lecture Notes in Engineering

The Springer-Verlag Lecture Notes provide rapid (approximately six months), refereed publication of topical items, longer than ordinary journal articles but shorter and less formal than most monographs and textbooks. They are published in an attractive yet economical format; authors or editors provide manuscripts typed to specifications, ready for photo-reproduction.

The Editorial Board

Managing Editors

C.A. Brebbia
Wessex Institute of Technology
Ashurst Lodge, Ashurst
Southampton SO4 2AA (UK)

S. A. Orszag
Applied and Computational Mathematics
218 Fine Hall
Princeton, NJ 08544 (USA)

Consulting Editors

Chemical Engineering:

J. H. Seinfeld
Dept. of Chemical Engg., Spaulding Bldg.
Calif. Inst. of Technology
Pasadena, CA 91125 (USA)

Dynamics and Vibrations:

P. Spanos
Department of Mechanical and
Civil Engineering, Rice University
P.O. Box 1892
Houston, Texas 77251 (USA)

Earthquake Engineering:

A. S. Cakmak
Dept. of Civil Engineering, Princeton University
Princeton, NJ 08544 (USA)

Electrical Engineering:

P. Silvester

ABSTRACT

Stochastic linearization is perhaps the most frequently used analytical method for analyzing the response of many nonlinear systems, as it provides reasonable estimates of the mean square response. However, the method is not, in general, well suited for estimating the power spectra of stationary responses of randomly excited nonlinear systems. In addition, for a Gaussian excitation, the linearized solution leads to a Gaussian probability distribution, whereas the true response is non-Gaussian. In this study, a higher order method termed equivalent stochastic "quadratization" is proposed to circumvent these shortcomings. The nonlinearity is replaced by a polynomial expansion up to a quadratic order. In this manner the Volterra series method can be used to approximate the response of the resulting nonlinear system. The system excitation is assumed to be Gaussian. However, the response is described by a non-Gaussian probability distribution. The method is developed for analyzing the stationary response of single and multi-degree-of-freedom systems; pertinent instructional examples are included. Further, a useful practical application of the proposed method is pursued for analyzing the stochastic response of compliant offshore platforms due to nonlinear drag forces. These are structures used to exploit oil resources in great water depths. The compliant nature of these platforms introduces nonlinear behavior which can not be neglected as in conventional offshore platforms. The method is applied for analyzing a specific three-degree-of-freedom model of a Tension Leg Platform (TLP) subject to wave and current forces. In addition to nonlinear drag forces, nonlinear potential forces significantly affect the TLP response. These forces are derived in the form of second order Volterra series. A stochastic response analysis of the TLP system due to combined nonlinear drag and nonlinear potential forces is performed to evaluate the relative significance of these forces.

The analytical results produced by the equivalent quadratization method for the instructional and practical problems considered, are found in good agreement with pertinent numerical data generated by Monte Carlo studies.

Clearly, the concept of quadratic, or even higher power, polynomial approximation of arbitrary nonlinearities and subsequent application of the Volterra series expansion for determining the random response of the derived equivalent nonlinear system, appears to be quite promising and meritorious. However, it is noted that the present study is strictly preliminary in nature, and reporting its findings in the present format conforms with the objective of the Lecture Notes in Engineering Series. Additional research is required to address versatility, reliability, and efficiency issues.

Funding through a Presential Young Investigator Award from the National Science Foundation and a consortium of industrial firms is gratefully acknowledged; the partial support by grants from the National Center For Earthquake Engineering Research at the State University of New York at Buffalo is appreciated.

TABLE OF CONTENTS

CHAPTER 1:	INTRODUCTION	1
	1.1 Introduction	1
	1.2 Aim of Study	2
	1.3 TLP Model	3
	1.4 Environmental Loads	5
	1.4.1 Methods to Compute Viscous Forces	7
	1.4.2 Methods to Compute Potential Forces	8
	1.5 Literature Review of TLP Analyses	11
	1.6 Scope of Study	12
CHAPTER 2:	EQUIVALENT STOCHASTIC QUADRATIZATION FOR SINGLE-DEGREE-OF-FREEDOM SYSTEMS.....	14
	2.1 Introduction	14
	2.2 Analytical Method Formulation	15
	2.3 Derivation of Linear and Quadratic Transfer Functions .	21
	2.4 Response Probability Distribution	23
	2.5 Response Spectral Density	26
	2.6 Solution Procedure	26
	2.7 Example of Application	27
	2.8 Summary and Conclusions.....	37
CHAPTER 3:	EQUIVALENT STOCHASTIC QUADRATIZATION FOR MULTI-DEGREE-OF-FREEDOM SYSTEMS.....	41
	3.1 Introduction	41
	3.2 Analytical Method Formulation	41
	3.3 Derivation of Linear and Quadratic Transfer Functions .	45
	3.4 Response Probability Distribution	46
	3.5 Response Spectral Density	48
	3.6 Solution Procedure	48
	3.7 Reduced Solution Analytical Method	49
	3.8 Example of Application	50
	3.9 Summary and Conclusions.....	52
CHAPTER 4:	POTENTIAL WAVE FORCES ON A MOORED VERTICAL CYLINDER	58
	4.1 Introduction	58
	4.2 Volterra Series Force Description	58
	4.3 Near-Field Approach for Deriving Potential Forces	63
	4.3.1 Fluid Flow Boundary Value Problem	63
	4.3.2 Perturbation Expansion	66

4.4	Linear Velocity Potential	70
4.5	Added Mass Force	73
4.6	Linear Force Transfer Functions	73
	4.6.1 Wave Diffraction Force	73
	4.6.2 Wave Diffraction Moment	74
	4.6.3 Hydrodynamic Buoyancy Force	74
	4.6.4 Comparison to Morison's Equation	75
4.7	Quadratic Force Transfer Functions	75
	4.7.1 Wave Elevation Drift Force	75
	4.7.2 Wave Elevation Drift Moment	77
	4.7.3 Velocity Head Drift Force	78
	4.7.4 Velocity Head Drift Moment	79
	4.7.5 Body Motion Drift Forces and Moment	80
	4.7.6 Numerical Examples for Fixed Vertical Cylinder	81
4.8	Transfer Functions for Tension Leg Platform	85
	4.8.1 Modification of Cylinder Transfer Functions	85
	4.8.2 Numerical Example for Tension Leg Platform	86
4.9	Summary and Conclusions.....	94

CHAPTER 5:	EQUIVALENT STOCHASTIC QUADRATIZATION FOR TENSION LEG PLATFORM RESPONSE TO VISCOUS DRIFT FORCES	95
	5.1 Introduction	95
	5.2 Formulation of TLP Model	95
	5.3 Analytical Method Formulation	98
	5.4 Derivation of Linear and Quadratic Transfer Functions ..	102
	5.5 Response Probability Distribution	103
	5.6 Response Spectral Density	105
	5.7 Axial Tendon Force	105
	5.8 Solution Procedure	106
	5.9 Numerical Example	106
	5.10 Summary and Conclusions	114

CHAPTER 6:	STOCHASTIC RESPONSE OF A TENSION LEG PLATFORM TO VISCOUS AND POTENTIAL DRIFT FORCES	115
	6.1 Introduction	115
	6.2 Analytical Method Formulation	115
	6.3 Numerical Results	118
	6.3.1 Response to Quadratic Drag Force	118
	6.3.2 Response to Quadratic Wave Elevation/Velocity Head Force	122
	6.3.3 Response to Quadratic Body Motion Force	127
	6.3.4 Response to Combined Viscous and Potential Quadratic Forces	131
	6.3.5 Evaluation of Newman's Approximation	135
	6.3.6 High Frequency Axial Tendon Force	137
	6.4 Summary and Conclusions	145

CHAPTER 7: SUMMARY AND CONCLUSIONS.....	147
APPENDIX A: GRAM-CHARLIER COEFFICIENTS	151
A.1 Introduction	151
A.2 Gram-Charlier Coefficients	151
APPENDIX B: EVALUATION OF EXPECTATIONS	153
B.1 Introduction	153
B.2 Expectations Involving Quadratic Nonlinearity	153
B.3 High Order Central Moments	156
APPENDIX C: PIERSON-MOSKOWITZ WAVE SPECTRUM	158
APPENDIX D: SIMULATION METHODS	161
D.1 Introduction	161
D.2 Linear Wave Simulation	161
D.3 Linear Wave Force Simulation	161
D.4 Drag Force Simulation	162
D.5 Quadratic Wave Force Simulation	163
