
Sustainable Management, Wertschöpfung und Effizienz

Reihe herausgegeben von

Gregor Weber, Breunigweiler, Deutschland

Markus Bodemann, Warburg, Deutschland

René Schmidpeter, Köln, Deutschland

In dieser Schriftenreihe stehen insbesondere empirische und praxisnahe Studien zu nachhaltigem Wirtschaften und Effizienz im Mittelpunkt. Energie-, Umwelt-, Nachhaltigkeits-, CSR-, Innovations-, Risiko- und integrierte Managementsysteme sind nur einige Beispiele, die Sie hier wiederfinden. Ein besonderer Fokus liegt dabei auf dem Nutzen, den solche Systeme für die Anwendung in der Praxis bieten, um zu helfen die globalen Nachhaltigkeitsziele (SDGs) umzusetzen. Publiziert werden nationale und internationale wissenschaftliche Arbeiten.

Reihenherausgeber

Dr. Gregor Weber, ecoistics.institute

Dr. Markus Bodemann

Prof. Dr. René Schmidpeter, Center for Advanced Sustainable Management, Cologne Business School

This series is focusing on empirical and practical research in the fields of sustainable management and efficiency. Management systems in the context of energy, environment, sustainability, CSR, innovation, risk as well as integrated management systems are just a few examples which can be found here. A special focus is on the value such systems can offer for the application in practice supporting the implementation of the global sustainable development goals, the SDGs. National and international scientific publications are published (English and German).

Valuation of Renewable Energy Investments

Practices among German and Swiss
Investment Professionals

 Springer Gabler

Christian Hürlimann
Zurich, Switzerland

A thesis submitted to the University of Gloucestershire, UK in accordance with the requirements of the degree of Doctor of Philosophy in the Faculty of Business from Christian Hürlimann, MBA, MSc, Zürich, Switzerland, October 2018

Internal examiner: Prof. Dr. Bob Ryan
External examiner: Prof. Dr. Bernd Britzelmaier
Viva date: 04.07.2018

The original title of this thesis is Valuation Methods in Renewable Energy Investments: An Explanatory Mixed-Methods Study among German and Swiss Investment Professionals.

Dedication

This thesis is dedicated to my wife, Andrea; our new-born daughter, Emma Lou; my parents, Elsbeth and Bernhard; and my brother, Michael.

Acknowledgment

Performing this doctoral research was a long road, which would not have been possible without various key people, organisations, and institutions.

First, I am thankful to my wonderful wife, who gave me the opportunity to embark on such a long journey, as well as to my family and friends who supported my decision to pursue a doctoral degree. Furthermore, I would like to thank my supervisors: Prof. Dr. Dolores S. Bengoa, for her valuable advice, her support in performing this research from the beginning, and her introduction to her wide academic network, and Dr. Jasim Al-Ali, for his valuable professional advisory in the research area and his prompt, constructive, and detailed feedback. My thank goes also to my two examiners Prof. Dr. Bob Ryan and Prof. Dr. Bernd Britzelmaier for their valuable comments and recommendation of improvements. Without all these inputs, this current piece of research would have not been possible.

I would like to thank my employer, Elektrizitätswerke des Kantons Zürich (EKZ), which provided me with the foundation for the whole research, including the research topic, as well as the opportunity and resources to conduct this study.

I am also grateful to the members of my cohort at the University of Gloucestershire and the participants of our action learning circle in Switzerland, to the organisers of the doctoral colloquium at the Kalaidos University of Applied Sciences in Zurich, and to the academic group of energy policy at the ETH Zurich for the opportunity to present and discuss my research. I would like to extend my thanks to several master and doctoral students at the University of St. Gallen (HSG) and the Delft University of Technology for being able to offer advice and input and to discuss certain issues, whilst receiving new food for thought for my research.

Last but not least, this research would not have been possible without all the numerous study participants and people who put me into contact with other relevant persons and distributed my requests. This was not self-evident due to confidentiality reasons; however, the access to the data was crucial for this research. Therefore, I would express my gratitude to all the involved persons during this process.

Christian Hürlimann

Abstract

This research aims to evaluate the currently applied valuation approaches in practice among German and Swiss professional investors for renewable energy (RE) projects based on an explanatory, sequential, mixed-methods (MM) research approach, compared to existing financial theory. It additionally explores associated influencing factors, key equity value drivers, and 'best practice' approaches and/or improvements in order to propose a revised valuation approach specifically for such investments. The inferences (INFs) taken are obtained by integrating quantitative (QUAN) results from a survey of 111 practitioners with qualitative (QUAL) findings through in-depth interviews with 16 purposefully selected individuals from the pool of participants from the previous QUAN phase to explore those results in more detail.

The results and findings were both reassuring and surprising while still detecting a certain gap between theory and practice. As main research outcomes, it can be illustrated that both systematic and unsystematic risks are relevant for performing valuations of such investments. More specifically, for the former, political and market risks are the most important risk components, and for the latter, weather-related volume risk is most important. Risk preferences and subsequently valuation are clearly influenced by experienced materialisation of risk. Discounted cash flow (DCF)-based valuation is state of the art in this valuation, even if multiples are applied as a simplified benchmarking approach. Encountered risk leads either to adjustment in the cash flows or in the applied discount rate, the former being the main approach to treat risk in valuation. The internal rate of return (IRR) approach is the most frequently applied valuation methodology, even if the net present value (NPV) approach is theoretically more consistent and even though many practitioners do not seem to be aware of the former's potential drawbacks. Moreover, the market for such investments has agreed to apply a simplified flow to equity (FTE) valuation approach. It thus ignores the consideration of the right type of discount rate (a dynamic discount rate) for the typically applied autonomous financing structure based on project financing for simplification reasons. Market participants surprisingly still use the weighted average cost of capital (WACC) of the investing company, mostly as a basis for defining hurdle rates, even if finance theory could clearly demonstrate its irrelevance as a cost of capital (CoC) approach in DCF-based valuation. More sophisticated valuation methods are less known and not applied, even if the certainty equivalent (CE) and adjusted present value (APV) methods are promising, complementary methods to support conventional approaches for assessing the investment's value protection ability and performing impairment test respectively.

The discussion of the INF analysis results helps to increase the understanding of this complex topic and provides valuable insights into this usually hidden procedure. The applied MM approach allowed for the exploration of issues and the discussion of possible improvements in valuation practices, which would not be possible within a classic quantitative study. The developed concepts in this thesis provide practitioners, particularly equity investors, with powerful tools to define the relevant equity value drivers, to understand additional influencing factors in valuation and considerations of risk treatments in projects, and to value RE investments along the two dimensions of value creation and value protection.
