Foreword

This text is a revised and augmented version of a course given to graduate and Ph.D. students in the context of the doctoral school for physics in the French-speaking part of Switzerland. This doctoral school provides a common teaching program for the universities of Bern, Fribourg, Geneva, Neuchâtel and Lausanne, as well as for the Swiss Federal Institute of Technology in Lausanne. The scope of the course should be sufficiently general to interest both experimentalists and theoreticians wishing to engage in research in condensed matter or nuclear and particle physics. The prerequisites are an introductory course to quantum mechanics and elements of classical electromagnetism and statistical mechanics.

Our main concern was how to maintain a reasonably broad level of knowledge for students with different orientations, in a world of research where the price of survival is extreme specialization and competitiveness. Is it still possible in the available time to provide a cultural education in physics by relatively elementary means and in an optimized form? We believe that this is an essential pedagogical duty. Attempting to meet this challenge has determined the conception of this book: each individual part of it is standard and without novelty but should belong, in our opinion, to the basic culture of every physicist; only their common organization in a single house of decent size might possibly be put to our credit.

We have tried to keep a balance between formal developments and the physical applications: in fact they cannot be separated insofar as mathematical methods develop naturally under the necessity of resolving physical questions. Concerning the applications, we have always given a short description of the phenomenological context so that the main information about physical facts is available from the start without recourse to other sources. In the formal developments, we adopt the usual notation of physicists, while aiming at mathematical precision. The reader is warmly encouraged to improve his practice of the formalism by checking and reproducing for himself the algebra given in the text. Some more extended exercises are proposed at the end of each chapter in order to illustrate additional aspects not introduced in the main text.

For each of the systems discussed in this book, we have tried to exhibit how the main physical ideas can be captured in a formalized description by

the appropriate tools. In this spirit several important branches of physics are represented: solid state physics (cohesion and dielectric properties of the electron gas, phonons and electron–phonon interactions), low temperature physics (superconductivity and superfluidity), nuclear physics (pairing of nucleons), matter and radiation (interaction of atoms with the quantum-electromagnetic field), particle physics (interaction by exchanged intermediate particles, mass generation by the Higgs mechanism).

These choices could be considered rather conservative, compared to topical new developing areas. However we think that they still serve as indispensable paradigms for the understanding of any more advanced subject. Also, in keeping with our aim of offering a broad formative view to our readers, they enable us to illustrate similarities and differences between concepts stemming from various domains in physics. In this respect, the first chapter presents a parallel exposition of classical electromagnetism and classical elasticity, with the purpose of introducing and comparing the notions of photon and phonon. Moreover, quantum fields (Chap. 8) cannot be understood without a good knowledge of their classical analogues. Chapter 2 is devoted to a simple description of collective effects due to Bose and Fermi statistics. Bose condensation is described and the role of Fermi statistics for the stability of matter and in astrophysical objects is discussed. In the third chapter we develop the so-called second quantized formalism in full generality without reference to any particular system, so that it will be available in any situation where the number of particles varies. Chapters 4, 5 and 6 are devoted to the use of the variational method. It is hoped that the reader will appreciate the wide range of applications of the idea of fermionic pairing formulated in the BCS theory for superconductivity (Chap. 5) as well as for nuclear matter (Chap. 6). The relationship between superfluidity (Chap. 7) and superconductivity on the one hand, and collective excitations of the nuclei on the other, is put into perspective. The quantum-electromagnetic field serves as a model for other quantized matter fields in Chap. 8. The concept of gauge theory is introduced and the close analogy between the Higgs mechanism and the Meissner effect displayed. The method of Feynman graphs is explained in Chaps. 9 and 10, stressing again the existence of a common language for condensed matter and field theory. We essentially give the physical interpretation of diagrams without performing the corresponding more technical quantitative calculations. The analysis is restricted to ground-state properties: non-zero temperature Green functions and the alternative functional integration viewpoint are not considered.

The book is not aimed at the specialist in any of the addressed topics. In fact, no chapter is intended to provide the up-to-date knowledge necessary for an immediate fight on the battlefield of research. We refer in particular to the present state of relativistic quantum field theory since, without mentioning electroweak theory and chromodynamics, no presentation of the Lorentz group or of the Dirac equation can be found here. From the viewpoint of con-

condensed matter, high- T_c is only briefly touched, mesoscopic physics and highly correlated fermions are not discussed. To the prospective particle physicist, the book can merely give a complementary education on the use of similar techniques in condensed-matter physics. Conversely, physicists belonging to the latter discipline, although they may be aware of the importance of field theory for particle physics, should learn about fundamental ideas underlying both domains. We therefore hope that our readers will discover a certain unity of thinking among different domains of physics. In this case, this book will not have been written in vain.

This book was written at the instigation of the Troisième Cycle de la Physique en Suisse Romande, and in particular of J.-J. Loeffel. We are grateful to the many colleagues who provided useful suggestions or enlightenment on various points, namely to the late P. Huguenin and to B. Jancovici, D. Pavuna, J.-P. Perroud and G. Wanders. V. Savona helped with the elaboration of the exercises at the end of each chapter. We thank R. Fernandez for encouraging us to translate the book. S. Goldfarb translated and typed the whole text, including the numerous equations; D. Watson helped us to formulate additional material; L. Klinger and L. Trento drew the figures; our thanks go to all these people for their contributions. Finally we are indebted to the Institute of Condensed-Matter Physics and the Physics Section of the University of Lausanne, as well as to the Physics Department of the Swiss Federal Institute of Technology, Lausanne, for financial support.

Table of Contents

1. Classical Fields and Their Associated Particles	3
1.1 Introduction	3
1.2 The Quantum Harmonic Oscillator	6
1.2.1 Review of Properties	6
1.2.2 Coherent States	10
1.2.3 The Forced Oscillator	15
1.2.4 Normal Order	17
1.3 The Electromagnetic Field and the Photon	19
1.3.1 Maxwell's Equations	19
1.3.2 Gauge Transformations	20
1.3.3 Decomposition of the Field into Longitudinal and Transverse Components	22
1.3.4 Hamiltonian of the Interaction of Radiation with Non-Relativistic Matter	24
1.3.5 Fourier Analysis of the Classical Free Field	26
1.3.6 Photons and Electromagnetic Waves	30
1.4 The Elastic Field and the Phonon	33
1.4.1 Elastic Waves and Elastic Energy	33
1.4.2 Elastic Waves and Energy of an Isotropic Solid	35
1.4.3 Fourier Analysis of Elastic Waves	39
1.4.4 An Ensemble of Phonons and Classical Elastic Waves	41
1.4.5 The Classical Linear Chain	42
1.4.6 The Linear Quantum Chain	46
Exercises	49
2. Fermions and Bosons	51
2.1 The Principle of Symmetrization	51
2.1.1 Identical Particles	51
2.1.2 One-Particle States	52
2.1.3 Periodic Boundary Conditions and the Thermodynamic Limit	54
2.1.4 n -Particle States	58
2.1.5 Symmetrization	60

2.1.6	Symmetry of Composite Particles	64
2.1.7	Occupation Number Representation	65
2.2	Degenerate Gases	68
2.2.1	The Ground State of n Bosons	68
2.2.2	The Ground State of n Fermions	75
2.2.3	Stability of Matter	79
2.2.4	Nucleo-Electronic Plasma at High Density	82
2.2.5	Fermions and Gravitation	84
	Exercises	86
3.	Systems with Variable Particle Number	89
3.1	Introduction	89
3.2	Formalism of the Second Quantization	90
3.2.1	Fock Space	90
3.2.2	Creation and Annihilation Operators	92
3.2.3	States of Fock Space	96
3.2.4	Normal Order	99
3.2.5	One-Body Operators	101
3.2.6	Free Evolution and Symmetries	104
3.2.7	Two-Body Operators	108
3.2.8	Reduced Density Matrices and Correlations	113
3.2.9	Correlations in Free Fermi and Bose Gases	118
3.3	Quantum Physics and the Concept of a Perfect Gas	121
	Exercises	123
4.	Electron Gas	127
4.1	The Hartree–Fock Method	127
4.1.1	The Variational Principle	127
4.1.2	The Hartree–Fock Equations	129
4.2	Electron Gas in the Hartree–Fock Approximation	133
4.2.1	Electron Gas and Its Hamiltonian	133
4.2.2	The Hartree–Fock Energy	137
4.3	The Dielectric Function	142
4.3.1	Screening and the Plasmon	142
4.3.2	Response to an External Charge	145
4.3.3	Evolution of a Charge Fluctuation	148
4.3.4	The RPA Dielectric Function	152
	Exercises	157
5.	Fermion Pairing and Superconductivity	161
5.1	Does There Exist an Analogue of the Bose Condensation for Fermions?	161
5.2	The Phenomenology of Superconductivity	163
5.2.1	Experimental Facts	163
5.2.2	The Phenomenological Approach	165

5.2.3	Macroscopic Quantum Fluids	169
5.2.4	Existence of the Energy Gap	173
5.3	BCS Theory	174
5.3.1	The Effective Interaction Between Electrons	174
5.3.2	Application of the Variational Method to Superconductivity	176
5.3.3	Sign Ambiguity	179
5.3.4	Variational Class of BCS States	180
5.3.5	How to Calculate with a BCS State	182
5.3.6	Search for a Minimum-Energy State	186
5.3.7	The Energy Gap	190
5.3.8	Spatial Extension of a Cooper Pair	192
5.4	Particle Number and Phase in Superconductivity	194
5.4.1	Is it Necessary to Fix the Particle Number or the Phase?	194
5.4.2	Analogy with Statistical Physics	195
5.5	High- T_c Superconductivity	197
	Exercises	199

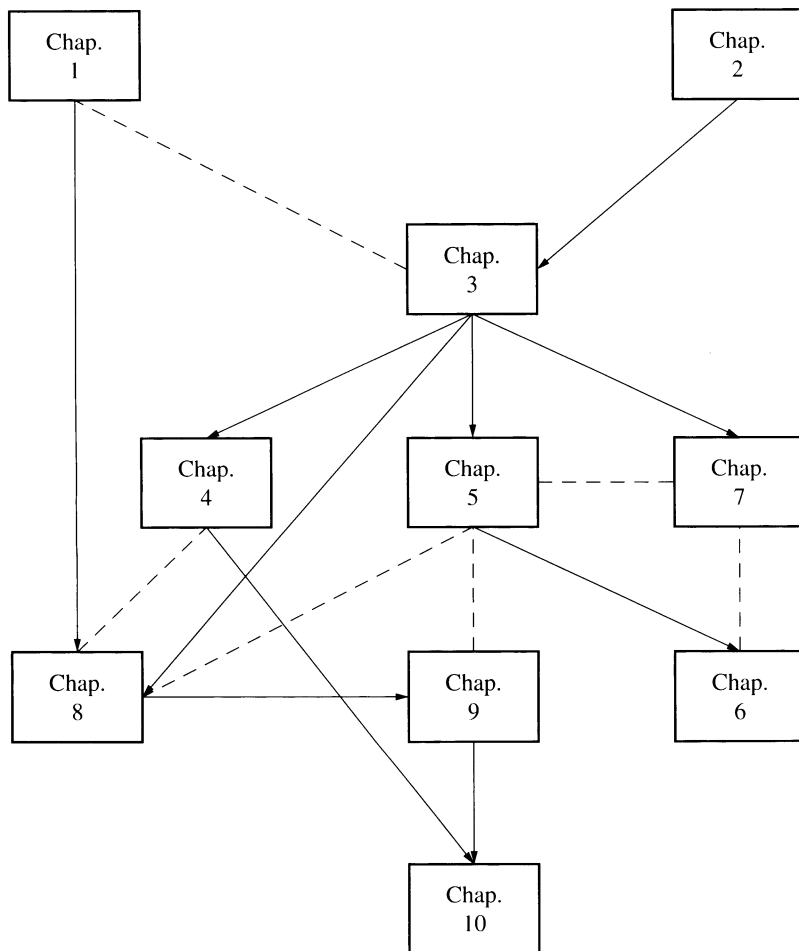

6. Nucleon Pairing and the Structure

	of the Nucleus	201
6.1	Introduction	201
6.2	A Broad Outline of the Nuclear Structure	202
6.2.1	Nuclear Forces	202
6.2.2	The Liquid Drop Model	203
6.2.3	Pairing Energy	206
6.2.4	Shell Energy	207
6.3	The Shell Model	209
6.3.1	The Average Potential of the Shell Model	209
6.3.2	Magic Numbers	210
6.4	Pairing of the Nucleons	213
6.4.1	Necessity of the Model	213
6.4.2	The Interaction Responsible for the Pairing	215
6.4.3	The Variational Method and the State of Paired Nucleons	217
6.4.4	Determination of the Ground State of a Paired Nucleus	220
6.4.5	Ground and Excited States of a Spherical Paired Nucleus	221
6.4.6	The Spectra of Paired Nuclei	224
6.4.7	Total Angular Momentum of Spherical Even-Even Nuclei	226
6.5	Relation Between Pairing and Superfluidity	228
6.5.1	How Can a Nucleus Be a Superfluid?	228
6.5.2	An Excited Nucleus in a Rotational State	229

6.5.3	Moment of Inertia of a Deformed Nucleus	230
	Exercises	232
7.	The Superfluidity of Liquid Helium	233
7.1	Experimental Facts	233
7.1.1	Phase Diagram of ${}^4\text{He}$	233
7.1.2	Properties of the Superfluid Phase of He II	235
7.2	Quantum Liquid and the Two-Fluid Model	238
7.2.1	The Superfluid Phase and Quantum Liquid	238
7.2.2	Dissipation in a Superfluid	239
7.2.3	Second Sound	244
7.3	The Energy Spectrum of He II	248
7.3.1	Excitations of He II	248
7.3.2	Non-Viscous Flow Through a Capillary	252
7.4	Imperfect Bose Gas	254
7.4.1	Bogoliubov's Approximation and Transformation	254
7.4.2	Bose Gas or Liquid?	258
7.5	Superfluidity of the Light Isotope ${}^3\text{He}$	260
7.5.1	A Fermi Liquid	260
7.5.2	Superfluidity of ${}^3\text{He}$	261
	Exercises	262
8.	Quantum Fields	265
8.1	Introduction	265
8.2	The Quantum-Electromagnetic Field	267
8.2.1	The Free Field	267
8.2.2	Canonical Variables	271
8.2.3	Invariant Commutation Function and Microcausality	272
8.2.4	Emission of Photons by a Classical Source	275
8.2.5	Coherent States of Photons	278
8.2.6	Emission and Absorption of Photons by an Atom	280
8.2.7	Spontaneous Emission	283
8.2.8	Equilibrium of Photons and Matter	285
8.2.9	Photon Statistics	286
8.3	Massive Scalar Field	288
8.3.1	Neutral Scalar Field	288
8.3.2	The Yukawa Potential	291
8.3.3	Charged Scalar Field	297
8.3.4	Spin and Statistics	303
8.3.5	The Lagrangian Formalism	304
8.3.6	The Gauge Invariance Principle and Field Interactions	308
8.3.7	Mass Generation	313
8.4	Electrons and Phonons	319
8.4.1	Non-Relativistic Fermi Field	319
8.4.2	The Quantum-Elastic Field	323

8.4.3	Electron-Phonon Interactions	325
	Exercises	329
9.	Perturbative Methods in Field Theory	333
9.1	Introduction	333
9.2	The Green Functions	335
9.2.1	Definition	335
9.2.2	The Free-Particle Green Function	339
9.2.3	Particle in an External Field	342
9.2.4	Simplified Example: The Cooper Pair	347
9.3	Perturbative Expansion of the Scattering Operator	350
9.3.1	Time-Dependent Perturbation Theory	350
9.3.2	The Scattering Operator	354
9.3.3	Fermions and Bosons in Interaction	358
9.3.4	The Wick Theorem for Chronological Products	361
9.3.5	Chronological Contractions and Propagators	364
9.3.6	Feynman Diagrams	368
9.4	Applications	374
9.4.1	Physical Interpretation of the Diagrams	374
9.4.2	Electromagnetic Interactions: Compton Scattering	379
9.4.3	Quantum Electrodynamics: Radiative Corrections	386
9.4.4	Electron-Phonon Interactions	390

Reader's Guide

Logical organization of the material: the arrows indicate a recommended reading order

Chapter 1 offers an incomplete summary of quantum mechanics and of classical field theory. By consequence, it recalls notions which are useful, but which are generally part of an undergraduate repertoire. It is left to the reader to determine the necessity for a thorough study of its contents.
