The **Stochastic Modelling and Probability Theory** series is a merger and continuation of Springer's two well established series Stochastic Modelling and Applied Probability and Probability and Its Applications series. It publishes research monographs that make a significant contribution to probability theory or an applications domain in which advanced probability methods are fundamental. Books in this series are expected to follow rigorous mathematical standards, while also displaying the expository quality necessary to make them useful and accessible to advanced students as well as researchers. The series covers all aspects of modern probability theory including

- Gaussian processes
- Markov processes
- Random Fields, point processes and random sets
- Random matrices
- Statistical mechanics and random media
- Stochastic analysis

as well as applications that include (but are not restricted to):

- Branching processes and other models of population growth
- Communications and processing networks
- Computational methods in probability and stochastic processes, including simulation
- Genetics and other stochastic models in biology and the life sciences
- Information theory, signal processing, and image synthesis
- Mathematical economics and finance
- Statistical methods (e.g. empirical processes, MCMC)
- Statistics for stochastic processes
- Stochastic control
- Stochastic models in operations research and stochastic optimization
- Stochastic models in the physical sciences

Preface

The purpose of this book is to provide an introduction to stochastic controls theory, via the method of dynamic programming. The dynamic programming principle, originated by R. Bellman in 1950s, is known as the two stage optimization procedure. When we control the behavior of a stochastic dynamical system in order to optimize some payoff or cost function, which depends on the control inputs to the system, the dynamic programming principle gives a powerful tool to analyze problems. Exploiting the dependence of the value function (optimal payoff) on its terminal cost function, we will construct a nonlinear semigroup which allows one to formulate the dynamic programming principle and whose generator provides the Hamilton–Jacobi–Bellman equation. Here we are mainly concerned with finite time horizon stochastic controls. We also apply the semigroup approach to control-stopping problems and stochastic differential games, and provide with examples from the area of financial market models.

This book is organized as follows. Chapters 1–4 deal with completely observable finite-dimensional controlled diffusions. Chapters 5 and 6 are concerned with Hilbert space valued stochastic processes, related to partially observable control problems.

Chapter 1 is a review of stochastic analysis and stochastic differential equations with random coefficients for later uses. Chapter 2 deals with control problems with finite-time horizon. By a time-discretization method we construct a semigroup, associated with the value function, whose generator provides the Hamilton–Jacobi–Bellman equation. When the value function is smooth, it becomes a classical solution of the Hamilton–Jacobi–Bellman equation. However, it satisfies the equation in viscosity sense even if it is not smooth. Chapter 3 is concerned with viscosity solutions of nonlinear parabolic equation, including Hamilton–Jacobi–Bellman equations of stochastic controls and also stochastic optimal control-stopping problems. Chapter 4 presents zero sum, two-player, time-homogeneous, stochastic differential games and the Isaacs equations. We consider stochastic differential games by using progressive strategies. Then we construct semigroups associated with the upper and lower values, by using a semidiscretization method. These semigroups lead to the formulation of the dynamic programming principle and

to the upper and lower Isaacs equations. The link between stochastic control and differential game is given via the risk sensitive control. Chapter 5 is a review on stochastic evolution equations on Hilbert spaces, in particular stochastic parabolic equations with colored Wiener noises. Basic definitions and results and Itô's formula are presented. Chapter 6 is concerned with control problems for Zakai equations. We again construct semigroups associated with the value functions. The dynamic programming principle and viscosity solutions of Hamilton–Jacobi–Bellman equations on Hilbert spaces are treated by using results obtained in the previous chapters. We show the connection between controlled Zakai equations and control of partially observable diffusions.

Acknowledgement

This book was planned as a new edition of *Stochastic Control Theory*, ISI Lecture Notes 9 (1981) following F. Delbaen's recommendation. I would like to acknowledge his recommendation together with valuable advice during preparation of the manuscript.

The author is greatly indebted to W. H. Fleming, who read carefully the manuscript and offered many valuable comments and suggestions, especially for Chap.4, which led to a much improved version. Many thoughtful helps and encouragements had been given by experts and friends, particularly F. Asakura, Y. Fujita, H. Nagai, and T. Uratani who helped to improve the book at various stages. H. Morimoto assisted in writing the manuscript by carefully reading it and making valuable comments, especially on mathematical economics.

Contents

1 Stochastic Differential Equations	1
1.1 Review of Stochastic Processes	1
1.1.1 Random Variables	1
1.1.2 Stochastic Processes	5
1.1.3 Itô Integrals	10
1.1.4 Itô's Formula	13
1.2 Stochastic Differential Equations	15
1.2.1 Lipschitz Continuous SDEs with Random Coefficients	15
1.2.2 Girsanov Transformations	18
1.2.3 SDEs with Deterministic Borel Coefficients	22
1.2.4 Backward Stochastic Differential Equations	24
1.3 Asset Pricing Problems	26
1.3.1 Formulation	26
1.3.2 Backward SDE for the Selling Price	27
1.3.3 Parabolic Equation Associated with (1.84)	29
2 Optimal Control for Diffusion Processes	31
2.1 Introduction	31
2.1.1 Formulations	32
2.1.2 Value Functions: Basic Properties	34
2.2 Dynamic Programming Principle (DPP)	40
2.2.1 Discrete-Time Dynamic Programming Principle	41
2.2.2 Approximation Theorem	46
2.2.3 Dynamic Programming Principle	47
2.2.4 Brownian Adapted Controls	50
2.2.5 Characterization of the Semigroup $(V_{\theta t}, \theta \leq t)$	53
2.3 Verification Theorems and Optimal Controls	58
2.3.1 Verification Theorems	58
2.3.2 Examples of Optimal Control	62
2.4 Optimal Investment Models	68
2.4.1 Formulations	68

2.4.2	Investment Problems for Power Utility Function	71
2.4.3	Optimal Investment Strategy	73
3	Viscosity Solutions for HJB Equations	79
3.1	Formulations	79
3.1.1	Definition of Viscosity Solution Based on Parabolic Differentials	80
3.1.2	Equivalent Definitions	82
3.1.3	Viscosity Solutions via Semigroups	86
3.2	Uniqueness of Viscosity Solutions	88
3.2.1	Crandall–Ishii Lemma	88
3.2.2	Structural Condition	93
3.2.3	Comparison Principle.....	95
3.3	HJB Equations for Control-Stopping Problems	100
3.3.1	Formulations	100
3.3.2	DPP.....	102
3.3.3	Semigroups Associated with DPP	109
3.3.4	American Option Price	112
4	Stochastic Differential Games	117
4.1	Formulations	117
4.1.1	Admissible Controls and Strategies	117
4.1.2	Formulation of Stochastic Differential Games	120
4.2	DPP	125
4.2.1	\mathcal{D} -Lower and \mathcal{D} -Upper Value Functions	125
4.2.2	DPP for Lower- and Upper Value Functions	131
4.3	Isaacs Equations.....	134
4.3.1	Semigroups Related to the DPP	135
4.3.2	Viscosity Solutions of the Isaacs Equations	138
4.4	Risk Sensitive Stochastic Controls and Differential Games	141
4.4.1	Logarithmic Transformation	141
4.4.2	Small Noise Limit	144
4.4.3	Note on Control with Infinite Time Horizon	148
5	Stochastic Parabolic Equations	153
5.1	Preliminaries	153
5.1.1	\mathbb{H} -Random Variables	154
5.1.2	Continuous Martingales	156
5.1.3	Correlation Operators.....	159
5.2	Stochastic Integrals	160
5.2.1	Definitions and Basic Properties	160
5.2.2	Martingale Inequalities	164
5.3	Stochastic Parabolic Equations with Colored Wiener Noises	167
5.3.1	Preliminaries	168
5.3.2	Linear Stochastic Parabolic Equations.....	171
5.3.3	Regularities of Solutions	174

- 5.3.4 Semilinear Stochastic Parabolic Equations with Lipschitz Nonlinearity 177

Notations

Let a and b be real numbers.

$$a \vee b = \max\{a, b\}, \quad a \wedge b = \min\{a, b\}$$

$$a^+ = \max\{a, 0\}, \quad a^- = \min\{-a, 0\}$$

$\delta_{i,j}$ = Kronecker symbol

\mathbb{R}^d denotes d -dimensional Euclidean space

x^i denotes the i -th coordinate of $x \in \mathbb{R}^d$

$$x \cdot y = \sum_{i=1}^d x^i y^i, \quad |x|^2 = x \cdot x$$

$$\mathbb{R}_+^d = \{x \in \mathbb{R}^d; \quad x^i > 0, \quad i = 1, \dots, d\}$$

$$S_r = \{x \in \mathbb{R}^d; \quad |x| \leq r\}$$

$\mathbb{R}^d \otimes \mathbb{R}^m$ denotes the set of $d \times m$ matrices

$$A_{ij}^i = (i, j) \text{ entry of } A \in \mathbb{R}^d \otimes \mathbb{R}^m$$

A^\top = transpose of A

$\text{tr } A$ = trace of $A \in \mathbb{R}^d \otimes \mathbb{R}^d$

$$|A|^2 = \text{tr}(A^\top A) = \text{tr}(AA^\top) \quad \text{for } A \in \mathbb{R}^d \otimes \mathbb{R}^m$$

I_d = d -dimensional unit matrix

S^d = the set of symmetric $d \times d$ matrices

$$S_+^d = \{A \in S^d; \quad A \text{ is nonnegative definite}\}$$

$$S_{++}^d = \{A \in S^d; \quad A \text{ is positive definite}\}$$

$\mathcal{B}(U)$ = the σ -field generated by all open subsets of U

$L^p(\Omega, \mathcal{G}; \mathbb{R}^d)$ = the set of \mathcal{G} -measurable d -dimensional random variables with

$$E |\xi|^p < \infty, \quad \text{for } p \geq 1$$

$L^p([0, T] \times \Omega, (\mathcal{F}_t); \mathbb{R}^d)$ = the set of (\mathcal{F}_t) -progressively measurable

d -dimensional processes with $\int_0^T E |X(t)|^p dt < \infty$, for $p \geq 1$

$$\Gamma = L^\infty([0, T] \times \Omega, (\mathcal{F}_t); \Gamma)$$

$\sigma(\xi)$ = the σ -field generated by ξ

Let Σ be a metric space.

$C(\Sigma)$ = the set of real valued continuous functions defined on Σ

$$C_b(\Sigma) = \{\phi \in C(\Sigma); \quad \phi \text{ is bounded}\}$$

$$C_{bu}(\Sigma) = \{\phi \in C_b(\Sigma); \quad \phi \text{ is uniformly continuous}\}$$

$C_p(\Sigma) = \{\phi \in C(\Sigma); \phi \text{ is polynomial growing}\}$, when Σ is a Banach space.
 $C_K^\infty(\mathbb{R}^d) = \{\phi \in C(\mathbb{R}^d); \phi \text{ has compact support and continuous derivatives of any order}\}$
 $C^{12}((0, T) \times \mathbb{R}^d) = \{\phi \in C((0, T) \times \mathbb{R}^d); \partial_t \phi, \partial_i \phi, \partial_{ij} \phi \in C((0, T) \times \mathbb{R}^d), i, j = 1, \dots, d\}$,
 where $\partial_t = \frac{\partial}{\partial t}$, $\partial_i = \frac{\partial}{\partial x_i}$, $\partial_{ij} = \frac{\partial^2}{\partial x_i \partial x_j}$
 $C^{12}([0, T] \times \mathbb{R}^d) = \{\phi \in C([0, T] \times \mathbb{R}^d) \cap C^{12}((0, T) \times \mathbb{R}^d); \partial_t \phi, \partial_i \phi, \partial_{ij} \phi \text{ can be extended to continuous functions on } C([0, T] \times \mathbb{R}^d), i, j = 1, \dots, d\}$
 $C^{12}((0, T] \times \mathbb{R}^d)$ and $C^{12}([0, T] \times \mathbb{R}^d)$ are defined similarly
 χ_A = the indicator function of the set A
 $\partial_x \phi$ = gradient vector of ϕ
 $\partial_{xx} \phi$ = matrix of second order partial derivatives of $\phi = (\partial_{ij} \phi)_{i,j=1,\dots,d}$
 $\phi/\Lambda = \phi$ restricted to a set Λ

$H_0 = L^2(\mathbb{R}^d)$ with the usual inner product (\cdot, \cdot) and norm $\|\cdot\|$
 \mathbf{I} = identity mapping
 Δ = Laplacian operator
 $H_p = \{\phi \in H_0; \text{generalized derivatives of } \phi \text{ up to order } p \text{ belong to } H_0\}$, $p = 1, 2, \dots$
 $\|\phi\|_{H_p} = \|(\mathbf{I} - \Delta)^{\frac{p}{2}} \phi\|$
 $H_{-1} = \{\text{Borel functions } \phi; (\mathbf{I} - \Delta)^{-\frac{1}{2}} \phi \in H_0\}$
 $\|\phi\| = \|\phi\|_{H_1}$, $\|\phi\|_* = \|\phi\|_{H_{-1}} = \|(\mathbf{I} - \Delta)^{-\frac{1}{2}} \phi\|$
 $\langle \phi, \psi \rangle$ = duality product between $\phi \in H_{-1}$ and $\psi \in H_1$
 Let \mathbb{H} and \mathbb{Y} be Hilbert spaces.
 $L^2(\mathbb{H}; \mathbb{Y})$ = Hilbert space of Hilbert–Schmidt operators from \mathbb{H} into \mathbb{Y}
 $\|\Phi\|_Q = \|\Phi Q^{\frac{1}{2}}\|_{L^2(\mathbb{H}; \mathbb{Y})}$, where Q is a symmetric and nonnegative definite operator on \mathbb{H}

$\mathbb{M}^{2c}([0, T], (\mathcal{F}_t); \mathbb{H})$ = set of continuous and square integrable \mathbb{H} -valued (\mathcal{F}_t) -martingales on $[0, T]$
 $\langle M \rangle$ = quadratic variation process of M
 $\langle M, N \rangle$ = quadratic variation process corresponding to M and N
 $D^p F(z)$ = p -th Fréchet derivative of F at z
 $C^{12}([0, T] \times \mathbb{H}) = \{F \in C([0, T] \times \mathbb{H}); \partial_t F, DF \text{ and } D^2 F \text{ are continuous on } [0, T] \times \mathbb{H}\}$
 $A \Rightarrow B$ = if A then B

Abbreviations

RHS = right-hand side

LHS = left-hand side

USC = upper semicontinuous

LSC = lower semicontinuous

ONB = orthonormal basis

w.r.t. = with respect to

a.e. = almost everywhere
