Preface

In this book, the author has presented an introduction to the practical application of some of the essential technical topics related to computer-aided engineering (CAE). These topics include interactive computer graphics (ICG), computer-aided design (CAD), computer-aided analysis (CAA) and computer-integrated manufacturing (CIM). Unlike the few texts available, the present work attempts to bring all these seemingly specialised topics together and to demonstrate their integration in the design process through practical applications to real engineering problems and case studies.

This book is the result of the author's research and teaching activities for several years of postgraduate and undergraduate courses in mechanical design of rotating machinery, computer-aided engineering, practical applications of finite elements, solid mechanics, engineering dynamics and properties of materials at Cranfield Institute of Technology, Oxford Engineering Science and the University of Manchester Institute of Science and Technology (UMIST). It was soon realised that no books on the most powerful and versatile tools available to engineering designers existed. To satisfy this developing need, this book, on the use of computers to aid the design process and to integrate design, analysis and manufacture, was prepared.

The main text examines the detailed design principles of the various mechanical components which are not peculiar to the present case studies but common to other fields of mechanical engineering. The design parameters necessary for successful operation are also considered and the steps taken to ensure maximum life and reliability of the components are outlined. Although every attempt has been made to verify the different designs, no responsibility can be accepted for their performance in practice.

Following a brief introduction of the terminology used, Chapter 2 provides a detailed description of the techniques adopted in three-dimensional automated modelling. Chapter 3 provides a detailed account of the computer-aided design of two practical case studies involving the design of (i) a centrifugal peening equipment and (ii) a fluid coupling. Throughout this work, both 3-D solid modelling and 2-D draughting were interactively utilised to create, manipulate and retrieve the different geometries. In view of its importance to design, analysis and manufacture, emphasis was given to solid modelling representation. Chapter 4 provides a truly practical introduction to the application of the finite element method to structural stress analysis of mechanical systems. In Chapter 5, complete static stress analysis and dynamic response studies are performed on the different designs examined. In particular, it was desired to demonstrate the versatility of the techniques adopted in data-handling during model creation, mesh definition and model checking aspects. Chapter 6 deals with the computer-integrated manufacturing aspects of the work using the same data base developed during the modelling stage. Some coverage is also provided for numerically controlled machines.

The book is intended for mechanical, industrial and manufacturing engineers, design engineers and engineering managers. The work is also intended for postgraduates undertaking mechanical, industrial, manufacturing and production engineering degrees. It is also useful for technologists, academics and researchers working in the field of CAD/CAM. The material included is largely self-contained and readers are required to have some basic knowledge of design, analysis and manufacture; their awareness of computers will also be valuable.

Finally, I wish to acknowledge the following organisations for giving permission to reproduce a few relevant diagrams: Structural Dynamics Research Corporation — SDRC (USA), Tilghman Wheelabrator (UK) and Vacu-Blast International (UK).

Contents

<i>Preface</i>	vii
<i>Principal Notations</i>	xiii
Chapter 1 Introduction	1
1.1 The Developing Design Process	1
1.2 Design Methodology	3
1.3 Interactive Computer Graphics (ICG)	5
1.4 Computer-Aided Engineering (CAE)	7
1.4.1 Computer-Aided Design (CAD)	7
1.4.2 Computer-Aided Analysis (CAA)	8
1.4.3 Computer-Aided Draughting (CAD)	9
1.4.4 Computer-Integrated Manufacturing (CIM)	10
1.5 Initial Graphics Exchange Specification (IGES)	11
References	12
Chapter 2 Three-Dimensional Automated Modelling	13
2.1 Automated Computer Graphics	13
2.2 Different Types of Modelling	14
2.2.1 Wire-Frame Modelling	14
2.2.2 Surface Modelling	16
2.2.3 Solid Modelling	18
2.3 Merits of Solid Modelling	23
2.4 Limitations of Solid Modelling	23
References	24
Chapter 3 Computer-Aided Design	25
3.1 Introduction	25
First Case Study: Computer-Aided Design of Centrifugal Shot-Peening Equipment	26
3.2 The Shot-Peening Process	26

3.3	Historical Background	27
3.4	Design Constraints and Requirements	29
3.5	Conceptual Designs	30
3.5.1	A Simple Model to Determine the Rotational Speed of the Wheel	40
3.5.2	Computer-Aided Assembly of the Different Components of the Wheel Design	42
	Second Case Study: Computer-Aided Design of a Fluid Coupling	52
3.6	Principle of Operation	52
3.7	Design Constraints and Requirements	54
3.8	Flow Models and Analysis	55
3.9	Conceptual Design	57
3.10	Evaluation of Coupling Design	71
3.11	Modified Design	72
3.12	The Need for Engineering Analysis	72
	References	82
Chapter 4	Fundamentals of the Finite Element Method	84
4.1	Introduction	84
4.2	Fundamental Concept of the Finite Element Method	85
4.3	Fundamentals of Linear Elasticity	93
4.3.1	Stresses and Strains	93
4.3.2	Stress-Strain Relationships	95
4.3.3	Plane Stress and Plane Strain	96
4.3.4	Equilibrium Equations	99
4.3.5	Compatibility Equations	99
4.4	Principles of Finite Elements	100
4.4.1	Discretisation of a Body	100
4.4.2	Types of Elements	100
4.4.3	Division of the Body into Elements	103
4.4.4	Labelling of Nodes	105
4.4.5	Effect of Mesh Refinement and Higher Order Elements upon Accuracy of Solution	106
4.5	Interpolation Polynomial Functions	109
4.5.1	The Pascal Triangle	110
4.5.2	Lagrange Polynomials	111
4.6	Isoparametric Finite Element Representation	113
4.6.1	Intrinsic Co-ordinate System	113
4.6.2	Isoparametric Elements	113
4.7	Derivation of a General Expression for Element Stiffness Matrix	114
4.7.1	Isoparametric Elements: Stiffness Formulation	117
4.8	Computer Implementation of Finite Element	119
4.8.1	Automatic Mesh Generation	120
4.8.2	Input Data	120

4.8.3	Element Stiffness Matrix Generation and Assembly	121
4.8.4	Solution of Simultaneous Equations	122
4.9	Conclusions	123
	References	124
	Appendix	124
Chapter 5	Computer-Aided Analysis	126
5.1	Introduction	126
5.2	General Purpose Finite Element Software	127
5.3	Computer-Aided System for Data Processing	129
5.3.1	Pre- and Post-Processing	129
5.4	Interactive Mesh Generation	131
5.5	Non-Linear Structural Analysis	134
	First Case Study: Computer-Aided Analysis of Wheel-Assembly	135
5.6	Structural Stress Analysis	135
5.6.1	Geometry Definition, Model Preparation and Model Checking	135
5.6.2	Applied Loads and Imposed Restraints	139
5.6.3	Static Stress Analysis	142
5.7	Dynamic Response Studies	148
5.7.1	Modelling of the Assembly	148
5.7.2	Dynamic Response Analysis	150
	Second Case Study: Computer-Aided Analysis of Fluid Coupling	151
5.8	Structural Stress Analysis and Dynamic Response Studies	151
5.9	Conclusions	159
	References	160
Chapter 6	Computer-Integrated Manufacturing	162
6.1	Computer-Controlled Machine Tools	162
6.2	Types of Control Systems for NC Machines	164
6.3	NC Part-Programming Languages	166
6.4	NC Programming with Interactive Graphics	167
6.5	Tool Path Generation	167
	First Case Study: Computer-Integrated Manufacturing of Critical Components of Wheel-Assembly	169
6.6	Choice of Materials	169
6.7	Manufacture of Wheel-Assembly	170
6.8	Development of NC Machining Programs	171
6.8.1	Machining of Main Shaft	171
6.8.2	Roughing Cut	174

6.8.3 Finishing Cut	174
6.8.4 Circlips and Undercut Machining	175
6.8.5 Milling Cut of Slots in Discs	175
Second Case Study: Computer-Integrated Manufacturing of Fluid Coupling	176
6.9 Choice of Materials and NC Machining Programs	176
6.9.1 Machining of Coupling's Output Shaft	176
6.9.2 Finishing Cut of Rotor	181
6.9.3 Cutter Location Source Files (CLSF)	187
6.10 Concluding Remarks	189
References	190
<i>Index</i>	193

Principal Notations

A	Area of cross-section; area of cross-section of one-dimensional element
$[B]$	Matrix containing the derivatives of shape functions
$[D]$	Elasticity matrix (relating stresses and strains)
E	Young's modulus
$E^{(e)}$	Young's modulus of the (e)th element
F	Force
$\{F\}$	Load vector
G	Modulus of rigidity
h	Convection heat transfer coefficient
I	Moment of inertia
$[J]$	Jacobian matrix
$[K]$	Global stiffness matrix
$[K^{(e)}]$	Element stiffness matrix
k	Thermal conductivity
L	Total length of bar
\mathcal{L}	Lagrange multiplier
$l^{(e)}$	Length of one-dimensional element (e)
N	Shape function
$\{p\}$	Load vector
r, θ, z	Cylindrical polar co-ordinates
R	Radius
T	Temperature; torque; transpose
u, v, w	Respective components of displacements in x , y and z directions
V	Volume of a body

v	Velocity
W	Work done by external forces
x, y, z	Cartesian co-ordinates; global co-ordinates
Y	Yield stress
α	Coefficient of linear thermal expansion
γ	Shear strain
$\{\delta\}$	Displacement vector
ε	Strain
$\varepsilon^{(e)}$	Strain in the (e)th element
$\{\varepsilon\}$	Strain vector
ν	Poisson's ratio
ξ, η, ζ	Intrinsic co-ordinates
π	Strain energy of a solid body
$\pi^{(e)}$	Strain energy of the (e)th element
ρ	Density
σ	Stress
$\sigma^{(e)}$	Stress in the (e)th element
$\{\sigma\}$	Stress vector
τ	Shear stress
ω	Frequency of vibration; angular velocity

Superscripts

(e)	Identifies the element number
$[]^T$	Indicates the transpose of a matrix

Subscripts

s	Shot
t	Target
