## Table of Contents

<b>Preface.</b>	XI
<b>Chapter I - Tensor Distributions.</b>	
1.1. - Tensor distributions over a pseudo-Riemannian manifold.....	1
1.2. - Covariant derivative of a tensor distribution.....	4
1.3. - The distributions $Y^+$ , $Y^-$ and $\bar{\delta}$ corresponding to a hypersurface.....	6
1.4. - Tensor discontinuities relative to a hypersurface.....	10
1.5. - Generalization of $\nabla T^D$ .....	12
1.6. - The case of continuous tensors.....	14
<b>Chapter II - Maxwell's equations and electromagnetic waves over a curved space-time.</b>	
II.1. - Space-time.....	18
II.2. - Singular 2-form.....	19
II.3. - Maxwell's equations and the formal Cauchy problem.....	21
II.4. - Maxwell's equations and potential-vector.....	25
II.5. - Ordinary electromagnetic waves.....	28

### **Chapter III - Einstein's equations and the Leray theorem.**

III.1. -	The system of Einstein equations.....	33
III.2. -	Harmonic quantities.....	38
III.3. -	Einstein's equations and harmonic charts.....	41
III.4. -	Strictly hyperbolic matrices.....	44
III.5. -	Leray systems.....	47
III.6. -	The Einstein equations in the exterior case.....	49
III.7. -	The case of pure matter.....	53

### **Chapter IV - Gravitational and electromagnetic shock waves.**

IV.1. -	Gravitational shock waves.....	60
IV.2. -	Singular double 2-form.....	64
IV.3. -	Einstein's equations in the weak sense, Conditions of shock.....	68
IV.4. -	A geometric consequence.....	76
IV.5. -	Propagation of discontinuities.....	77
IV.6. -	Consequences.....	81
IV.7. -	Electromagnetic shock waves.....	84
IV.8. -	Propagation of discontinuities for an electromagnetic shock wave.....	87
IV.9. -	Gravitational shock wave in an electromagnetic field.....	91
IV.10. -	Gravitational and electromagnetic shock waves (with Maxwell tensor).....	94

**Chapter V - Relativistic hydrodynamics.**

V.1. -	Equations of relativistic hydrodynamics.....	98
V.2. -	Characteristic hypersurfaces of the hydrodynamic system.....	102
V.3. -	A Leray system and the Cauchy problem.....	107
V.4. -	Sonic waves.....	114
V.5. -	Main property of the rays in hydrodynamics.....	116
V.6. -	Thermodynamic hypothesis.....	121

**Chapter VI - The equations of magnetohydrodynamics.**

VI.1. -	Electromagnetic field with induction.....	124
VI.2. -	Maxwell equations and energy tensor of Minkowski.....	128
VI.3. -	The case of the magnetohydrodynamics.....	129
VI.4. -	The main equations of relativistic magnetohydrodynamics.....	131
VI.5. -	The equation of continuity and the system of the lines of flow.....	133
VI.6. -	Magnetosonic waves and Alfven waves.....	135
VI.7. -	Magnetosonic speeds and Alfven speeds.....	140
VI.8. -	Representations of the wave cones in $\mathbb{R}^3$ .....	144
VI.9. -	Main property of the rays associated to the magnetosonic waves.....	150
VI.10. -	Property of the rays associated to the Alfven waves.....	156

## Chapter VII - Magnetohydrodynamic shock waves.

VII.1. -	The main system of the shock waves.....	159
VII.2. -	Analysis of the shock equations.....	162
VII.3. -	New form of the shock equations for $\ell^\alpha \ell_\alpha \neq 0$ .....	168
VII.4. -	Alfven shocks.....	170

## Chapter VIII - Hugoniot's function and applications.

VIII.1. -	Relativistic Hugoniot's relation for $\ell^\alpha \ell_\alpha \neq 0$ .....	174
VIII.2. -	Differential of Hugoniot's function.....	177
VIII.3. -	Differential of $S$ along a straight line ( $\ell^\alpha \ell_\alpha \neq 0$ ).....	179
VIII.4. -	The case where $\ell^\alpha \ell_\alpha = 0$ is impossible.....	182
VIII.5. -	Orientation of shock wave fronts in the time.....	185
VIII.6. -	Thermodynamic inequalities for the shocks.....	186
VIII.7. -	Isentropic curves and Hugoniot's curve.....	191
VIII.8. -	Speeds of shock waves.....	195
VIII.9. -	Isentropic curves and weak shocks.....	197
VIII.10. -	The case $\tau'_s > 0$ .....	199
VIII.11. -	The case $\tau'_s < 0$ .....	202
VIII.12. -	Conclusions.....	210

## Annex I - Shock waves and alfven waves.

AI.1. -	Singular shocks.....	211
AI.2. -	Compatibility between shock waves and Alfven waves.....	220

**Annex II - Magnetosonic rays.**

All.1. -	Directions of the rays.....	226
All.2. -	Action of $\delta$ on the direction of the ray.....	229

**Annex III - Classical approximations of the relativistic shock equations.**

All.1.-	The frame connected with the shock.....	232
All.2.-	Classical approximation.....	232

<b>Bibliography.....</b>	<b>235</b>
--------------------------	------------

**Note - Approach to a quantum theory of fields for a curved space-time.**

<b>I - Tensor propagators.....</b>	<b>237</b>
------------------------------------	------------

NI.1. -	Orientations over a space-time.....	237
NI.2. -	Global hyperbolicity.....	239
NI.3. -	Bitensors and Dirac bitensors.....	240
NI.4. -	Linear differential-tensor operators associated with $g$ ..	242
NI.5. -	Elementary Kernels and propagators.....	244
NI.6. -	Tensor propagators relative to the space-time of Minkowski.....	249
NI.7. -	Propagators relative to the operator $(\Delta + \psi)$ .....	252

**II - Applications to quantization problems over a curved space-time.**

NII.1. -	Commutator for vector Meson.....	256
NII.2. -	Commutator for a free electromagnetic field.....	258
NII.3. -	Commutator for a varying gravitational field with mass	259
NII.4. -	Commutator for a varying gravitational field without mass term .....	265
NII.5. -	Creation. Annihilation operators.....	267
NII.6. -	Dirac field.....	272
<b>References for the Note.....</b>		<b>278</b>

## PREFACE

For seventy years, we have known that Einstein's theory is essentially a theory of propagation of waves for the gravitational field. Confusion enters, however, through the fact that the word *wave*, in physics, implies sometimes repetition and sometimes not. This confusion is often increased by the use of Fourier transforms, by which a disturbance which appears to be without repetition is resolved into periodic wave-trains with all frequencies. But, in a general curved space-time, we have nothing corresponding to Fourier transforms.

Here, we consider systematically waves corresponding to the propagation of discontinuities of physical quantities describing either fields (essentially electromagnetic fields and gravitational field), or the motion of a fluid, or together, in magnetohydrodynamics, the changes in time of a field and of a fluid.

The main equations, for the different studied phenomena, constitute a *hyperbolic system* and the study of a formal Cauchy problem is possible. We call *ordinary waves* the case in which the derivative of superior order appearing in the system are discontinuous at the traverse of a hypersurface, the wave front ; we call shock waves the case where the derivatives of an order inferior by one are discontinuous at the traverse of a wave front.

From 1950, many well-known scientists (Taub, Synge, Choquet-Bruhat, etc.) have studied the corresponding equations for different physical phenomena : systems associated to the electromagnetic and gravitational fields, to hydrodynamics and to magnetohydrodynamics.

The purpose of this book –which is a book of mathematical physics– is to give a synthesis of the results and to precise some new results, using a unique method, the method of *the tensor-distributions*. In particular, this method is a powerful tool for the study of the gravitational shock waves and for the magnetohydrodynamical shock waves, where a complete theory may be given. Such a theory is specially adapted to astrophysics, in particular for the treatment of the pulsars.

The same method may be used for the quantization of some fields in a curved space-time. Therefore, we have included in the book a Note concerning an approach of the quantization of fields in this context.

We hope that this book is clear and contains sufficiently detailed mathematical proofs, with the suitable mathematical rigor. One of its purposes is to give an easy access to the different works on this subject during half-century and also to most recent results.
