Games for Health 2014

Proceedings of the 4th conference on gaming and playful interaction in healthcare

Springer Vieweg
Preface

The Fourth European Games for Health Conference 2014 (GFHEU 2014) brings together researchers, medical professionals and game developers to share information about the impact of games, playful interaction and game technologies on health, health care and health policy. Over two days, more than 500 attendees will participate, in over 13 sessions provided by an international array of more than 50 speakers, cutting across a wide range of activities in health and well-being. Conference topics include exergaming, physical therapy, disease management, health behaviour change, biofeedback, scientific validation, rehab, epidemiology, training, cognitive health, nutrition and education.

As we are aiming for innovation and further integration of research and game development in health care, this year we continued to add an extra academic track to the conference. These proceedings are the outcome of that integration and contain 20 full papers presented at the conference in the form of oral presentations or posters. In this volume we have opted for not breaking down the papers into separate chapters. Our previous experience has taught us that such divisions are always a bit artificial, and so much more when dealing with health games. The academic track is interwoven into the conference’s broader structure to further promote dialogue between academics and practitioners working within the fields of Game & Play Studies, Design Research, Game Development and the Medical Community, exploring and innovating within the greater area of health. This track is labelled ‘Share your Research’ in your conference program.

Yet, looking over the works submitted to this volume, few interesting trends are discerned.

Social relatedness and empowerment of the (end) user

Not always following the predominately-paternalistic approach, health games aim to facilitate self-efficacy and allow people to take charge of their own health and wellbeing. Designers and doctors join together to empower the patients like never before. Games are not only regarded as products (applications) but also as services for a longstanding relationship between patients, doctors, relatives and care providers or between medical doctors and students, to learn the practice of medicine. Several papers in these proceedings address motivational issues and meaningful (adaptive) feedback to facilitate these longstanding relationships. Moreover it becomes practice to integrate the game, app or applied toy in already existing forms of therapy, educational practices or other application domains. Using the gaming’s affinity with social play and the rising spreadibility of media over social networking sites, the focus shifts from top-down to bottom-up and more participatory healthcare.

Theory and educational practice.

The theory of games for health in health care settings is also gaining traction, such as modelling patients behaviour in clinical immersive environments targeting at medical education or the theoretical underpinning of exergames. Perhaps even more
important is to study the public acceptance of these applications, allowing the game designer to anticipate in the design of even better appreciated games and play experiences. A clear trend, happily supported by the Games4Health conference, is the increase of number of games used in professional education of medical doctors.

**Game mechanics, architecture and data.**

Digital games allow players to use advanced computational power, (haptic) devices, consoles, wearable’s, visualization, persuasive technology and create immersive environments. Using the Oculus Rift in games for pain management is a good example, but also adaptive games that take into account the abilities of the individual players. As health games become further embedded in the toolsets of caretakers and patients alike, a call for standardization and new architectures arises. Whether in the form of building rigid data structures to share between platforms, or more particular recommendations for world-builders, the call for agreed frameworks is out there.

**Validation.**

As always, validation is a hot topic, but perhaps an interesting trend is emerging in coupling validation with design theory. No longer based on traditional validation techniques originating purely in the medical domain, validation through design is the next thing. Which means that a therapy, cure or rehabilitation can be validated on its effect but also can be used to evaluate and deepen the design (theory of) the game mechanics.

In view of this all, the GFHEU 2014 proceedings can be considered as a timely document that provides many new results and insights in the new field of Games for Health. We would like to thank all members of the Program Committee for their most valuable and highly appreciated contribution to the conference by reading submissions, writing reviews, and participating in the discussion phase. We hope to provide you with many pleasant and fruitful reading hours.

Organizing Committee

Conference Chair:
  Jurriaan van Rijswijk (Games for Health Europe)
Program Chair
  Ben Schouten (Eindhoven University of Technology)
Organizers
  Hannieta Beuving (Games for Health Europe)
  Alex Gekker (University of Utrecht)
  Sandra van Rijswijk (Games for Health Europe)

Reviewers

Albert Salah  
Bogazici University, Istanbul, Turkey

Alex Gekker 
University of Utrecht & Games for Health Europe, Netherlands

Bart Brandenburg 
Medicinfo, Netherlands

Ben Schouten 
Eindhoven University of Technology & Amsterdam University of Applied Sciences, Netherlands

Berry Eggen 
Eindhoven University of Technology, Netherlands

David Nieborg 
University of Amsterdam, Netherlands.

Ellis Bartholomeus 
Ellisinwonderland, Netherlands

Erik Van Der Spek 
Eindhoven University of Technology, Netherlands

Erinc Salor 
University of Amsterdam, Netherlands.

Joris Dormans 
Amsterdam University of Applied Sciences, Netherlands.

Marcelo Vasconcellos 
Oswaldo Cruz Foundation – Fiocruz, Brazil

Marlies Schijven 
Academic Medical Center Amsterdam, Netherlands.

Matthias Rauterberg 
Eindhoven University of Technology, Netherlands

Mirjam Vosmeer 
Amsterdam University of Applied Sciences, Netherlands.

Rafael Bidarra 
Delft University of Technology, Netherlands.

Simon McCallum 
Gjøvik University College, Norway

Stephanie Klein Nagelvoort-Schuit 
Erasmus University, Rotterdam, Netherlands

Vero Vanden Abeele 
eMedia Lab, Group T – Leuven Engineering School, CUO Catholic University Leuven, Belgium.
Table of Contents

“On call: antibiotics”- development and evaluation of a serious antimicrobial prescribing game for hospital care ................................................................. 1
  *Enrique Castro-Sánchez, Esmita Charani, Luke Moore, Myriam Gharbi and Alison Holmes*

Virtual Reality and Mobius Floe: Cognitive Distraction as Non-Pharmacological Analgesic for Pain Management ......................................................... 8
  *Amber Choo, Xin Tong, Diane Gromala and Ari Hollander*

Gaming as a training tool to train cognitive skills in Emergency Care: how effective is it? ........................................................................................................ 13
  *Mary Dankbaar, Maartje Bakhuys Roozeboom, Esther Oprins, Frans Rutten, Jan van Saase, Jeroen van Merrienboer and Stephanie Schuit*

Games [4Therapy] Project: Let’s talk! .................................................................... 15
  *Menno Deen, Evelyn J.E. Heynen, Ben A.M. Schouten, Peer G.H.P van der Helm and Andries M. Korebrits*

Tunnel Tail: A New Approach to Prevention ........................................................ 27
  *Mathea Falco, Jesse Schell and Deidre Witan*

A game design of a Serious Game for supporting the compliance of diabetic adolescents ...................................................................................................... 37
  *Regina Friess, Nina Kolas and Johannes Knoch*

The Effect of Social Sharing Games and Game Performance on Motivation to Play Brain Games ......................................................................................... 48
  *Jeana Frost and Allison Eden*

Patients Should Not Be Passive! Creating and Managing Active Virtual Patients in Virtual Clinical Environments ................................................................. 56
  *Wm Leroy Heinrichs, Parvati Dev and Dick Davies*

The Opinions of People in the Netherlands over 65 on Active Video Games: a Survey Study ..................................................................................................... 62
  *Annerieke Heuvelink, Erwin Tak and Nico Van Meeteren*

Tactical Forms: Classification of Applied Games for Game Design .................... 67
  *Micah Hrehovcsik, Joeri Taelman, Niels Keetels and Joep Janssen*

Development of Exergame-based Virtual Trainer for Physical Therapy using Kinect ........................................................................................................... 79
  *Baihua Li, Mark Maxwell, Daniel Leightley, Angela Lindsay, Wendy Johnson and Andrew Ruck*
